'Your people are confoundedly sharp dealers then,' grumbled the manager, as he rose deliberately from his chair. 'They ought to know you are a solvent party, and that your word is as good for the money—ay, as our own.'

'Well, never mind that, Fred,' said Burton. 'Let me have the money, and I can get my business done in an hour; and then'—

'Ah! it's of no use making an appointment later on in the evening,' interrupted the manager; 'I have an engagement for to-night, so we can't have a chat after your business is completed. We will leave it till to-morrow.' With this he quitted the room; summoned the watchman, who was already on duty; and after an interval, which might really have been ten minutes, but which seemed to the merchant as though it would never end, the slow step of Mr Rockman, who was

corpulent and heavy in build, was heard returning. He bore a small leathern case, whose distended sides shewed it was crammed with something; and a guess at its contents made Mr Burton's heart leap.

Little divining the condition of his visitor, the manager quietly sat down, drew towards him a sloping desk, on which were writing materials; and after adjusting his spectacles with more care and accuracy than, it appeared to Burton, any man's spectacles could possibly require, proceeded to write out a receipt for the money. Burton execrated the slow and formal style in which his friend had been taught to write, as he watched the carefully finished up-and-down stroke of every letter. The manager had got about half-way in his task when, struck by a sudden thought, he smiled, laid down his pen, and then shaking his head, as a man does when he half-regretfully recalls the memory of some past enjoyment, said: 'Lor bless me! you were running in my mind nearly all day on Saturday last. What do you think? Why, I met poor old Davy Lobbins'—

'Oh! confound—— Did you though?' exclaimed Burton. 'Well, let us get this business out of hand, and we will have a talk about the old fellow.'

'Poor old chap!' mused Mr Rockman; 'he seems very much broken. Quite a different man from what'—

'Now really, Rockman!' exclaimed Burton, 'you forget how precious my time is. Do go on; there's a good fellow.'

Thus adjured, the manager resumed his writing as slowly as before, but it was done at last. 'Sign that, my boy,' said he, pushing the document towards his visitor. 'You will find that correct, I think.'

Burton signed it instantly without reading a line, and tossed it back.

'You always were a cool hand,' said the manager half-reprovingly and half-admiringly; 'but I think I should look at what I signed, when it concerned a respectable number of thousands.'

Burton smiled feebly; the situation was too painfully interesting for him to do more. The manager carefully placed the receipt in a drawer of the table, opened the case, and taking out a huge bundle of notes, commenced to count them. 'You don't mind Jacob's and Levy's draft on Rothschild for three thousand, do you?' he said. 'If you won't take that, I can't do it until'—

'Oh, never mind!' interrupted Burton; 'anything will do. Cut away; there's a good fellow.'

'Our gold and our own notes are locked up in the inner safe; but here is Colonial Bank paper, which may perhaps serve as well, unless'—

'Quite satisfactory,' interrupted the relieved merchant, as he eyed the welcome notes; 'quite good enough, Fred. Pray proceed!'

Mr Rockman stared impressively at him for a few seconds through his gold spectacles, as though such haste over so solemn a matter were unseemly, if not worse; however, he went on without remark. 'Five—five—two threes—one—two—three—four'—when at that instant a hack—Anglicè, a cab—dashed up to the door, and a thundering double-knock followed.

'Hollo! What's up now?' exclaimed the manager, pausing in his counting.

'Go on! go on! Never mind the door,' cried

Burton, half-rising from his seat. 'Why don't you go on?'

'Don't be ridiculous, Burton,' said the manager. 'Any one would think you had been drinking.—Come in.' These last words were in answer to a tap at the door; and the watchman presented himself. 'Well, what is it?' said the manager, turning to him, quite unconscious that his visitor had gathered himself up for a dash at the notes the moment the man spoke. 'Who was there?'

'It was a mistake, sir,' replied the watchman. The hack-driver was a stranger, and drove here instead of to the Royal Colonial.'

'All right,' said the manager. 'You may go, Dennis.—Now then, Mr Burton, we will proceed. Let me see, where was I? Five—five—two threes.—one—one,' &c.; and so on he went until his bundle of notes was exhausted. The draft on Rothschild was duly indorsed; the whole were restored to the case, and the case was handed to Mr Burton, after he had given up his deposit note.

'Of course,' added the manager, 'there's the balance of interest due to you, which to-morrow we shall make out when you call, and'—

'That's all right,' said Burton; 'but now I must be going.'

'You won't stop then? You are quite sure?' said the manager, as his customer rose. 'Well, good-night. Take care of the wallet. As your hotel is so short a distance from here, you may be safe; but if you had to leave the lamps for an instant, I should say: "Take a hack." Good-night.'

They shook hands and parted. Burton's first act was to inclose his precious case in a small locked satchel, which he then handed to the landlord, and saw it securely deposited in the great iron safe which all such places keep; then he drank off at a single gulp such a draught of brandy-and-water as excited the audible admiration of two or three men who were lounging at the saloon bar. Had it not been for this potent draught, he must have fainted; and as it was, he was fain to lie down, being thoroughly worn out and exhausted by the events of the day. In spite of his excitement, he slept soundly, so soundly and so long that the clanging of the breakfast-bell roused him from sleep, and hastily dressing himself, he went down to the saloon. At the very first glance he could see that something of interest was under discussion, for instead of sitting apart at separate tables, the guests were all gathered in earnest groups, talking and gesticulating like so many Frenchmen. As he made his way to a vacant table, a gentleman who, like himself, had just entered the room, said: 'Pretty state of things this, sir. What do you think of the news?'

'I really have not heard of any news this morning,' returned Burton; 'indeed I have but just left my room, having overslept myself.'

'Why, my dear sir,' exclaimed the other, evidently gratified at finding some one to whom he could be the first to impart the tidings—'why, have you not heard? The great Gulf of Carpentaria and Northern Australia Bank—the best bank in the province, has gone! Gone, sir! The mail came in last night with peremptory orders to close; so our bank won't open this morning; and it is said the depositors won't get half-a-crown in the pound.—Why,' pursued his new friend with

a sudden change of tone, 'you are not a loser, I hope?'

'I! O dear, no. Certainly not. By no means,' incoherently replied Burton, who found great difficulty in collecting himself sufficiently to say anything.

'I was afraid you were hit,' said the other, 'you turned so pale. So, as I was telling you'—

Mr Burton had civility enough to pay an outward show of attention to what followed; but the first great announcement had effectually discounted the interest of the narrative.

Directly his breakfast was over, he set out for the Colonial Bank, where he exchanged his notes for a draft payable to himself on his London bankers. He then repaired to the shipping office, to learn when the next packet sailed for England, as he was now ready to return, ay, even at so short a notice as that on which he had started. He had not gone fifty yards from the bank before he came face to face with Mr Rockman. He felt, it must be owned, a little sheepish at this rencontre; but no such sentiment appeared to influence the manager.

'Hollo! old fellow!' he exclaimed, as heartily as he could, under the depressing circumstances. 'I'll be shot if you were not in luck last night. But I'm glad you got your money, as I well know you only left it in to oblige the directors, and perhaps myself as an old friend. If you had left it in one day longer, you could not have touched a penny.'

'You don't say so!' exclaimed Burton.

'But I do though,' returned his friend; 'and I think, old fellow, as you have been so lucky, I may justifiably say I will drink that bottle of wine to-night at your expense. I think, friend Caleb, you may stand *that*.'

'My dear fellow,' exclaimed Burton, immensely relieved to find how philosophically the manager was treating what had been almost life or death to him, 'if there is a good bottle of port in Pelham, you shall have it, or fifty such if you will drink them.'

'Come, that's handsome,' returned the manager good-temperedly. 'But what is your hurry now? Where are you running to?'

'I am off to the shipping office,' said Burton, 'to see when the next packet sails for England.'

'The next packet can make no difference to you,' said Mr Rockman; 'you won't finish your business in time for her; every one could have told you that the *Hercules* sails to-morrow.'

'To-morrow?' echoed Burton. 'Good! I will send round the port wine to-night, Fred; but at present you must excuse me.'

The tale need be no longer drawn out, as nothing of interest remains to be told. The *Hercules* did sail the next day, Mr Burton being a passenger; his friend the manager was intensely astonished to hear this at first; but having received a hint that Mr Burton had only arrived by the *Cerberus*, his astonishment was changed to a feeling of the deepest admiration; and harassed though he was, consequent on the change in the fortunes of the Bank, he saw his friend off, and over and over again expressed his admiration, which as just said, was of the deepest, at his tact and energy.

The voyage of the *Hercules* was a speedy and prosperous one, so that when Mr Burton reappeared in his accustomed haunts, after what

seemed to his acquaintances a very brief absence, few suspected that in the short interval he had travelled thirty thousand miles and saved a fortune. The shabby Captain never knew what Mr Burton had done; but he had reason for saying, as he often did over his glass of grog at his favourite tavern, that 'Caleb Burton was one of the most liberal fellows he had ever met, and bore no grudge against a man for owing him a trifle.'

It only remains to add that the hero of this perfectly true tale is alive and well, and belongs to a race of shrewd-headed Scotchmen.

CALCULATING BY MACHINERY.

WE have been asked whether a brief description, intelligible to readers not versed in the abstruseness of mathematics, nor much inclined to the dull details of mechanical construction, could be given in this *Journal* of a Calculating Machine adverted to at a meeting of the British Association? Anything very attractive the subject cannot well be; but perhaps a few words bearing on it may be interesting.

Dr Spottiswood is the present President of the British Association for the Advancement of Science, his twelve months' occupancy of that office extending from the autumn of 1878 to the autumn of 1879. In his opening address at Dublin he discoursed learnedly on the recent progress of science, especially those branches which touch mathematical and physical investigations. Accuracy in calculations he pointed to as one of the most important elements of scientific progress; seeing that the truth of an asserted principle or general law must necessarily be greatly dependent on the correctness of the figures relating to quantities, numbers, measures, weights, ratios, proportions, and the like. Mr Babbage, the celebrated inventor of the two calculating machines which bear his name, used to say, when speaking of the difficulty of insuring accuracy in the long numerical calculations of theoretical astronomy, that the science which in itself is the most accurate and certain of all had, through its innate difficulties, become inaccurate and uncertain in some of its results. This feeling had much to do with the determination he formed to bring mechanism to the aid of calculation.

There was certainly something likely to whet the curiosity of his hearers in the remarks made on this subject by Dr Spottiswood. Going far beyond mere calculating machines is a contrivance introduced two or three years ago by Professor James Thomson, who occupies the chair of Civil Engineering and Mechanics at Glasgow University.

'Professor James Thomson,' said Dr Spottiswood, 'has constructed an apparatus which by means of the mere friction of a disk, a cylinder, and a ball, is capable of effecting a variety of the complicated calculations which occur in the highest applications of mathematics to physical problems. By its aid it seems that an unskilled labourer may, in a given time, perform the work of ten skilled mathematicians. The machine is applicable alike to the calculation

of tidal, of magnetic, of meteorological, and perhaps also of all other periodic phenomena. It will solve differential equations of the second and perhaps even of higher orders. And through the same invention, the problem of finding the free motions of any number of mutually attracting particles, unrestricted by any of the approximate suppositions required in the treatment of the lunar and planetary theories, is reduced to the simple process of *turning a handle*.' All this makes one think that the turning of a handle is a work more worthy of respect than the world is generally in the habit of supposing; the brain-work consists in determining and arranging what shall follow this merely mechanical process. Dr Spottiswood added: 'When Faraday had completed the experimental part of a physical problem, and desired that it should thenceforth be treated mathematically, he used irreverently to say: "Hand it over to the calculators." But truth is even stranger than fiction; and if he had lived until our day he might with perfect propriety have said: "Hand it over to the machine."'

All calculating machines of earlier invention are much more complicated than 'a mere disk, ball, and cylinder.' The Roman *abacus*, the Chinese *shwanpan*, the graduated rods called *Napier's bones*, and the *sliding-rule*, are, it is true, not very intricate in construction; but when calculating machines are spoken of, we understand something comprising a greater number of working parts, conjoined in action by various mechanical contrivances. Pascal constructed a machine for working out sums in the first four rules of arithmetic. It consisted of a series of cylinders working on a system through the medium of toothed wheels; each cylinder had figures or numerals marked on it. One wheel had twelve teeth to calculate pence; another had twenty to calculate shillings; while the rest had ten teeth each for the purpose of adding up units to make tens, tens to make hundreds, hundreds to make thousands, and so on. The apparatus was 'set' to its work as a boy would set a sum on his slate, and by turning one cylinder, the other cylinders and the wheels were set in action, producing a result which made its appearance as a sum, a difference, a product, or a quotient, according as the setting might be for addition, subtraction, multiplication, or division.

More than half a century ago the late Mr Babbage described before the Royal Astronomical Society two machines, which he had designed (not constructed) for working mathematical problems, and printing the results with inked type. The English government, after an investigation of the matter by a fully competent scientific committee, consented to bear the cost of perfecting one or both machines for performing and printing mathematical tables useful in navigation and other branches of science. So badly was the affair managed however, that the scheme has never been brought to a successful issue; the details were frequently being changed, the working drawings were exceedingly elaborate, new tools had to be invented, workmen had to be instructed, and Mr Babbage himself was a difficult man for the officials to deal with. First and last, the government advanced *seventeen thousand pounds* for this enterprise; and the result is an unfinished machine, placed in the keeping of King's College,

London. If finished, this machine, called by Babbage a *Difference Engine*, would have performed a vast number of arithmetical and algebraical calculations, presenting the solutions of problems with unerring accuracy. Another, which he called an *Analytical Engine*, but which only exists on paper, would have grappled with problems of a higher mathematical grade. To describe either of these inventions in a popular periodical is out of the question; the complexity of wheels, cylinders, axles, movable bolts, toothed gear, wedges, levers, pins, pivots, pointers, triggers, claws, cogs, spiral springs, ratchet wheels, &c., is such as to render the task hopeless.

Numerous other combinations of moving parts have been devised, less elaborate but more practicable than those of Babbage. Staffel has invented an arithmetical machine, in which three cylinders are so arranged that they can work all the simpler rules of arithmetic, carrying multiplication up to millions by millions; if the machine is required to solve an impossible sum, such as subtracting a larger number from a smaller, or dividing a smaller sum by a greater, it refuses, and rings a bell as an admonition! Colmar invented an arithmometer in which the action is rather by plates sliding in grooves than by rotating cylinders; like Staffel's, it can perform addition, subtraction, multiplication, division, and evolution. Wertheimer, by means of a metal plate with indexes, notches, teeth, and holes, has contrived an apparatus for adding and subtracting sums of money. Baranowski's invention is for calculating wages, prices, interest, and other sums of money; it is known as the Ready Reckoner, and is worked by means of a handle which reveals figures or numerals in openings in a brass plate. Schott, Lalanne, Roget, Maurel, Roth, Slovinski, and Scheutz have in like manner invented machines for solving arithmetical problems. Of these, Scheutz's excites great admiration among scientific men; Mr Babbage highly extolled it, and deplored that it had found a purchaser in America instead of in England. It can compute mathematical tables, calculate to sixteen places of figures, and stamp on a plate of lead the result up to eight places, producing a matrix or mould from which a *châtré* cast in type-metal can be obtained, suitable for printing from; it does its work at the rate of twenty-five figures or numerals per minute, calculated, recorded, and stamped in metal—an error either in the calculating or the printing being almost impossible.

Professor James Thomson's machine is specially remarkable for its simplicity. Dr Spottiswood, as we have seen, characterised it as comprising little more than a disk, a ball, and a cylinder. From the inventor's own description, given before the Royal Society in 1876, it appears that the disk rotates on an inclined or oblique axis, that the cylinder rotates on a horizontal axis, and that the ball simply rests at one point on the inclined disk, and at another against the curved side of the cylinder. The cylinder is wholly disconnected from the disk, by any wheel, lever, or other mechanism. When the disk is made to rotate by turning a winch-handle, it gives a peculiar motion to the ball, and this imparts rotary motion to the cylinder. Simple as is the action, all simplicity departs when we come to the Professor's account of the mode in which abstruse mathe-

matico-physical problems are solved by its aid: we here enter a region into which the *Journal* humbly confesses its unfitness to accompany the accomplished inventor of the apparatus. When Board schools have had twenty years' operation, perhaps the boys will duly understand the achievement of 'finding the free motions of any number of mutually attracting particles, unrestricted by any of the approximate suppositions required in the treatment of the lunar and planetary theories,' by merely turning a handle.

A few words on a somewhat allied subject—mental calculation as compared with machine calculation.

Mr George Bidder, (C.E., whose death was recently reported, attracted great attention while a mere boy by his amazing quickness of mental calculation. Many scientific persons visited and tested him, and from a contemporary record we extract the following as a few examples of the questions he answered, and the time taken to answer them: 'How many times does a wheel 7 feet 3 inches in circumference revolve in a distance of 13 miles 3 furlongs? Answer (in one minute), 9740½ times.—What is the product of 62,473,864, multiplied by 27,356? Answer (in three and a half minutes), 1,709,035,584. —What is the cube root of 122,615,327,232? Answer (in two and a half minutes), 4968.—If the Bible contains 743 pages, each page 57 lines, and each line 17 words, how many words are there in the book? Answer (in less than a minute), 719,967.—A statue stands between two trees; the pedestal of the statue is 90 feet from the top of each tree, the one tree is 60, the other 54 feet high; required the distance between the two trees? Answer (in one minute), 139 feet.'

A number of other questions put to the boy, he answered with astonishing rapidity and accuracy, the process being entirely mental. The numbers were in no case reduced to writing, but merely spoken aloud to him, and by repeating them to himself he kept them in his memory. It was noticed that in getting the product of two or more numbers, he generally found the highest numbers first, shewing that he did not work by ordinary rules. The answer to the second question given above is obviously wrong; but the error is probably in the newspaper report, as three figures are left out. This question, it may be noticed, can be done by an ordinarily quick arithmetician within the time taken by the famous 'calculating boy;' but the difficulty of arranging five long rows of figures in the mind and then adding them together makes the feat a remarkable one.

TO MY SWEETHEART.

THAT one and one make really two—
Most people will acknowledge true;
Yet even to this rule we find
Exception dear to lover's mind;
Thus, you and I, and I and you,
Are one and one, and still not two;
Least, so to me the figures run,
For surely, darling, we are One!

SATURDAY, MAY 24, 1879.

PRICE 1½d.

ANECDOTES OF ARTISTS.

LOVERS of Art are becoming more numerous year by year; and—though not perhaps in exact proportion—there is in consequence a growing interest in the men who are producing and have produced the wonderful works which delight us so much. A number of very interesting facts and anecdotes about Art and Artists have been recently collected and published by Mr Diprose, Lincoln's Inn Fields, London. A few of these we append.

Sir David Wilkie from the character of his delineations will always be a great favourite. We are here told how he became a painter. 'Sir John Sinclair happening once to dine in company with Wilkie, asked in the course of conversation if any particular circumstance had led him to adopt his profession. Sir John inquired: "Had your father, mother, or any of your relations a turn for painting? or what led you to follow that art?"

'To which Wilkie replied: "The truth is, Sir John, that *you* made me a painter."

"How! I?" exclaimed the Baronet. "I never had the pleasure of meeting you before."

'Wilkie then gave the following explanation: "When you were drawing up the *Statistical Account of Scotland*, my father, who was a clergyman in Fife, had much correspondence with you respecting his parish; in the course of which you sent him a coloured drawing of a soldier in the uniform of your Highland Fencible Regiment. I was so delighted with the sight, that I was constantly drawing copies of it; and thus, insensibly, I was transformed into a painter."

'Never,' relates Haydon, 'was anything more extraordinary than the modesty and simplicity of Wilkie at the period of his production of "The Village Politicians." Jackson told me he had the greatest difficulty in persuading him to send this celebrated picture to the Exhibition; and said he: "I remember his bewildered astonishment at the prodigious enthusiasm of the people at the Exhibition, when it went May 1806."

'On the Sunday after the private day and dinner,

The News said: "A young Scotchman, by name Wilkie, has a wonderful work." I (Haydon) immediately sallied forth, took up Jackson, and away we rushed to Wilkie. We found him in his parlour in Norton Street, at breakfast. "Wilkie," said I, "your name is in the paper." "Is it really?" said he, staring with delight. I then read the puff *ore rotundo* (in a clear voice); and Jackson, I, and he in an ecstasy joined hands and danced round the table.'

We must not pass from Wilkie without relating the following amusing story. 'On the birth of the son of a friend—afterwards a popular novelist—Sir David Wilkie was requested to become one of the sponsors for the child. Sir David, whose studies of human nature extended to everything but infant human nature, had evidently been refreshing his boyish recollections of kittens and puppies, for after looking intently into the child's eyes as it was held up for his inspection, he exclaimed to the father with serious astonishment and satisfaction: "He sees!"'

'During the residence in England of Haydn the celebrated composer, one of the royal Princes commissioned Sir Joshua Reynolds to paint his [Haydn's] portrait. Haydn went to the residence of the painter and gave him a sitting; but he soon grew tired. Sir Joshua, with his usual care for his reputation, would not paint a man of such distinguished genius with a stupid countenance, and in consequence he adjourned the sitting to another day. The same weariness and want of expression occurring at the next attempt, Sir Joshua communicated the circumstance to the commissioning Prince, who contrived the following stratagem. He sent to the painter's house a pretty German girl who was in the service of the Queen. Haydn took his seat for the third time; and as soon as the conversation began to flag, a curtain rose, and the fair German addressed him in his native tongue with a most elegant compliment. Haydn, delighted, overwhelmed the enchantress with questions; his countenance recovered its animation, and Sir Joshua rapidly and successfully seized its traits.'

'Opie was once painting an old beau of fashion.

Whenever this gentleman thought the painter was touching the mouth, he screwed it up in a most ridiculous manner. Opie, who was a blunt man, said very quietly: "Sir, if you want the mouth left out, I will do it with pleasure."

To return to Sir Joshua Reynolds. We are told of his 'Puck' that 'this merry imp is the portrait of a child, which was painted without any particular aim as to character. When Alderman Boydell saw it, he said: "Sir Joshua, if you will make this pretty thing into a Puck for my *Shakspeare Gallery*, I will give you a hundred guineas for it." The painter smiled and said little, as was his custom. A few hours' happy labour made the picture what we see it.'

'Sir Joshua once hearing of a young artist who had become embarrassed by an injudicious marriage, and was on the point of being arrested, immediately hurried to his residence, to inquire into the case. The unfortunate artist told the melancholy particulars of his situation; adding that forty pounds would enable him to compound with his creditors. After some further conversation, Sir Joshua rose to take his leave, telling the distressed painter he would do something for him. When bidding him adieu at the door, Sir Joshua took him by the hand, and after squeezing it cordially, hurried off with a benevolent triumph in his heart; while the astonished and relieved artist found in his hand a bank-note for one hundred pounds!'

Of Gainsborough we are told that 'both himself and his neighbours were ignorant of his genius, until one day—he was then residing at Sudbury—seeing a country fellow looking wistfully over his garden wall at some pears, he caught up a bit of board, and painted him so inimitably well that, the board being placed upon the wall, several of the neighbouring gentry and farmers immediately recognised the figure of a thief who had paid many unwelcome visits to their gardens; and being, by means of this impromptu portrait, charged by one of them with the robbery of his orchard, the thief acknowledged his guilt, and agreed, in order to avoid a worse fate, to enlist.'

Haydon's 'Mock Election' was painted in this wise. As many other artists have been both before and since, Haydon was in difficulties, and in July 1827 was an inmate of the King's Bench Prison. One day some of his fellow-prisoners got up a burlesque of an election. 'I was sitting in my own apartment,' writes the painter, 'buried in my own reflections, melancholy, but not despairing, at the darkness of my prospects and the unprotected condition of my wife and children, when a tumultuous and hearty laugh below brought me to my window. In spite of my own sorrows, I laughed out heartily when I saw the occasion.'

Haydon sketched the grotesque scene, painted it in four months, with the aid of noblemen and friends, and the advocacy of the press in exciting the sympathy of the country. The picture proved

attractive as an exhibition; still better, it was purchased by King George IV. for five hundred pounds; and it was conveyed from the Egyptian Hall to St James's Palace. A committee of gentlemen then undertook Mr Haydon's affairs; and with the purchase-money of the picture and the proceeds of the exhibition, the painter was restored to his family. In 1828 he painted, as a companion to this picture, 'The Chaining of the Members,' which was bought by Mr Francis of Exeter for three hundred guineas.

"Not one in ten thousand perhaps," it has been said, "can move his ears." The celebrated Mr Mery used, when lecturing, to amuse his pupils by saying that in one thing he surely belonged to the long-eared tribe; upon which he would move his ears very rapidly backwards and forwards. Albinus the celebrated anatomist had the same power, which is performed by little muscles not seen. Mr Haydon tried it once in painting, with great effect. In his picture of "Macbeth," painted for Sir George Beaumont, when the Thane was listening in horror, before committing the murder, the artist ventured to press the ears forward like an animal in fright, to give an idea of trying to catch the nearest sound. It is very effective, and increases amazingly the terror of the scene, without the spectator's being aware of the reason.'

A very interesting fact, which will be new to many, is thus given. 'That Tenterden steeple was the cause of Goodwin Sands does not appear a whit more strange than that in the Foundling Hospital originated the Royal Academy of Arts. Yet such was the case. The Hospital was incorporated in 1739, and in a few years the present building was erected; but as the income of the charity could not with propriety be expended upon decorations, many of the principal artists of that day generously gave pictures for several of the apartments of the Hospital. These were permitted to be shewn to the public upon proper application; and hence became one of the sights of the metropolis. The pictures proved very attractive; and this success suggested the annual exhibition of the united artists, which institution was the precursor of the Royal Academy in the Adelphi, founded in the year 1760. Thus within the walls of the Foundling the curious may see the state of British art previous to the epoch when King George III. first countenanced the historical talent of West.'

'Among the earliest "governors and guardians" of the Hospital we find William Hogarth, who liberally subscribed his money, and gave his time and talent towards carrying out the designs of his friend the venerable Captain Coram, through whose zeal and humanity the Hospital was established. Hogarth's first artistical aid was the engraving of a headpiece to a power-of-attorney, drawn for the collection of subscriptions towards the charity. Hogarth next presented to the Hospital an engraved plate of Coram. Among the

other early artistic patrons of the charity we find Rysbrach the sculptor, Hudson, Allan Ramsay, and Richard Wilson the prince of English landscape painters. They met often at the Hospital, and thus advanced charity and the arts together; for the exhibition of their donations in paintings, &c., drew a daily crowd of visitors in splendid carriages; and a visit to the Foundling became the most fashionable morning lounge of the reign of George II. The grounds in front of the Hospital were the promenade, and brocaded silks, gold-headed canes, and laced three-cornered hats formed, with their wearers, a gay sight in Lamb's Conduit Fields.'

We turn now from our own countrymen to foreign artists and the ancient masters. 'Vernet, the grandfather of the late famous French painter of the same name, relates that he was once employed to paint a landscape with a cave and St Jerome in it. He accordingly painted the landscape with St Jerome at the entrance of the cave. When he delivered the picture, the purchaser, who understood nothing of perspective, said: "The landscape and the cave are well made; but the saint is not in the cave."

"I understand you, sir," replied Vernet. "I will alter it." He therefore took the painting, and made the shade darker, so that the saint seemed to sit farther in. The purchaser took the painting; but it again appeared to him that the figure was not in the cave. Vernet then obliterated the figure, and gave the picture to the purchaser, who now at last seemed perfectly satisfied. Whenever he shewed the picture to strangers, he said: "Here you have a picture by Vernet, with St Jerome in the cave."

"But we cannot see the saint," the visitors would reply.

"Excuse me, gentlemen," the possessor would answer; "he is there; for I have seen him standing at the entrance, and afterwards farther back, and am therefore quite sure that he is in it!"

Rubens seems to have been a remarkably diligent painter. 'We are enabled to form some estimate of his astonishingly productive powers, when we consider that about one thousand of his works have been engraved. An extraordinary number of his paintings adorn the most celebrated public and private galleries, and many churches in different parts of Europe. Yet of the countless pictures everywhere attributed to Rubens, but a small proportion were entirely painted by his own hands; the others contain more or less of the workmanship of his pupils. Like many other great painters, Rubens was an architect too; his own house and the Church and College of the Jesuits in Antwerp were built from his designs.'

We shall conclude with the following amusing list of anachronisms in painting. 'These are to be found in works of all ages. Thus we have Verrio's *periwigged* spectators of "Christ healing the Sick;" Abraham about to shoot Isaac with a *pistol*; an Ethiopian king in a *surplice*, *boots* and *spurs*; Belin's "Virgin and Child" listening to a *violin*; and in Albert Dürer's "Angel driving Adam and Eve from Paradise," the angel wearing a *flounced petticoat*. Then we have Cigoli's "Simeon at the Circumcision" with *spectacles on nose*; the Virgin Mary helping herself to a *cup of coffee* from a chased *coffee-pot*; and St Jerome painted with a *clock* by his side. N. Poussin

has represented "The Deluge" with *boats*; and "Rebecca at the Well" with *Grecian* architecture in the background. And in a picture representing "Lobsters in the Sea listening to the Preaching of St Anthony of Padua," the lobsters are *red*; though yet it is to be presumed *unboiled*.'

YOUNG LORD PENRITH.

CHAPTER XXVIII.—IN WHICH LADY LARPENT RECEIVES A VISIT.

'A PERSON, my Lady, that very much wishes to see your Ladyship, please!' said the chief-butler, sliding deferentially on noiseless feet up to the corner of the Dowager's writing-table, in that study wherein the lady of Llosthuel, as has been mentioned, transacted most of the business that forms a necessary sequence to the possession of landed property.

'What sort of person?' asked Lady Larpent, putting down her pen.

The butler coughed. 'Very respectably dressed, my Lady. Did not seem to like giving his name. From another part of the country, he said.'

Now the butler-in-chief at Llosthuel Court knew his duty, as he would himself have modestly declared, and was as thoroughly imbued with the traditions of butlerdom as any member of the fraternity of men-servants within the compass of Britain. It would, to him, have been a labour of love to turn from the door any person of either sex, however decent in manner and apparel, who should presume to seek admission without stating a reason and giving a name. But Lady Larpent had some peculiarities. She was as easy of access as Dryden's rhymes record Lord Chancellor Shaftesbury to have been, and would rather have endured importunity than run the risk of shutting her ears against some well-founded complaint or cry of distress.

'You may shew the person in, Parker!' said the mistress of Llosthuel; and the obedient butler forthwith went in quest of the anonymous applicant for admission, ushered him into the Dowager's room of business, and retired.

'You wished to speak to me, Mr—Mr'—said Lady Larpent, to give the visitor an opportunity for self-introduction.

'I do, very much, wish to say a few words to your Ladyship,' returned the man with grave politeness; and there was something in the inflection of his deep voice, harsh, but modulated as those of the uneducated never are, which struck upon her ear, and made her eye the speaker more attentively than she had done before. At first sight she had set down the man, middle-aged, swarthy, ill-favoured of feature, and neatly clad in a suit of glossy black broadcloth, as a farmer seeking a farm, or perhaps a mining captain. Now, she was more disposed to consider him as a civil engineer, or possibly the promoter of some Company travelling in search of shareholders, to be recruited by the aid of a fluent tongue and an alluring prospectus.

'On what subject, may I ask? Please to be seated,' said Lady Larpent.

'I thank you, my Lady; but I prefer to stand,' replied the man, in whom the reader has no doubt recognised the Miller of Pen Mawth. 'And I will be as brief—knowing your Ladyship's time to be of value—as I can. All I ask is a fair and

patient hearing—yes, and one thing more, my Lady; that is, that you will be so kind as to bear in mind that, in doing what I do, I have no private object to gain, no selfish ends to compass, but act, in this instance, wholly and solely for the sake of truth and justice.'

This was very plausibly spoken, and with a weight of emphasis that would not have been thrown away upon any audience. Lady Larpent was impressed, in spite of herself, yet she did not altogether like the speaker, and did not by any means feel inclined to put implicit confidence in his assertions.

The Black Miller was not one of those who carry about with them that most ancient and natural of all letters of introduction which a frank and honest face affords. Still, the man might be honest. And Lady Larpent was not one of those rich persons who drape themselves in the comfortable mantle of indolence, and who would sooner be cheated, if only the cheating were decorously conducted behind their august backs, than submit to be pestered with unwelcome revelations. The Dowager had in her, in fact, somewhat of the turn of mind which has prompted kings and caliphs ere now to go about their capitals in mean disguise, and under the cloud of their incognito to feel, as it were, the popular pulse.

'I shall be happy to listen to whatever you may have to tell me, Mr—— By the way, you have not yet mentioned your name,' said the Dowager.

'I have not told you my name, my Lady,' answered Ralph Swart with perfect composure; 'and with your permission, I will continue to be nameless. My poor personality goes for nothing in what I have to say. I am well aware,' he continued, as his keen eye noted the signs of displeasure in Lady Larpent's face, 'that by withholding my own name I excite prejudice against myself and my story. The current of vulgar opinion sets strongly against those who blame others, and refuse to be confronted with the object of the accusation. Such persons are called by evil names. They are calumniators. They are base and malignant, and cowardly to boot. They are stabbers in the dark. Yet a man may have good and sufficient reasons for not backing up the word of warning which he finds it his duty to utter, by weighing his own credibility against that of the subject of it.'

This was very artfully imagined. It is sometimes good diplomatic policy to outstrip the judgment of an unfriendly critic, and to forestall, so to speak, all the severe things that he will be sure to think; just as Napoleon in a campaign was accustomed to discount the inevitable strategic blunders of his adversaries. The Black Miller, too, may have divined that Lady Larpent was precisely the person to pique herself on her own exemption from common prejudice. At anyrate, the stratagem met with at least a partial success, for the Dowager knit her judicial brows, and said calmly: 'I will hear whatever you have come to tell me, sir, although you do not give me your name.'

'I thank your Ladyship,' rejoined the Black Miller, in a voice as weighty as her own, 'for your courtesy.—And now to business. There is a young man in Treport here in the position, thanks to your Ladyship's patronage, of Captain of a coasting steam-vessel.'

'Are you speaking of Captain Ashton, of Hugh Ashton?' exclaimed the Dowager, half-incredulously, and opening her eyes a good deal wider than before.

'That is the name he bears,' replied the Black Miller, as composedly as before; 'Hugh—Ashton.'

'Do you mean to imply,' asked the Dowager, with feminine quickness, 'that his name is not Ashton?'

'I imply, my Lady, nothing of the sort,' returned Ralph Swart slowly. 'One thing I do say, and that plainly—Hugh Ashton is absolutely unworthy of your Ladyship's favour and protection. That much I know; and that much, and no more, I repeat. Hugh—Ashton, if you please—is not deserving of the station he fills, or of the confidence reposed in him.'

'Are you aware,' demanded the Dowager, in a glow of generous indignation, 'that the noble young fellow whom you traduce has rendered the very greatest service to our family—that he saved, at the risk of his own, the life of my niece, Miss Stanhope?'

'I never denied his courage, my Lady,' replied Ralph Swart, with a slight sneer, that made him even uglier than before. 'He is bold enough, and a smart lad in his way; and more's the pity that he should have deceived you, as he has done.'

'Deceived me!' repeated Lady Larpent, with an involuntary echo of the man's words, and then she looked the accuser full in the face. 'You must prove your words, and explain them, if you wish to be believed.'

'I beg your Ladyship's pardon, I am sure,' returned the Black Miller, with an affected humility which seemed genuine, so well did he control the voice in which he spoke. 'I have given offence, I fear, by unmasking the real character of one in whom your Ladyship feels an interest, and perhaps I had better go.' And Ralph Swart picked up his hat, which had been placed on the chair beside him, and seemed about to depart. Of course Lady Larpent bade him stay. She would have been more or less than woman if she had not. A secret undivulged, and this grim, stern, mysterious denouncer threatening to leave the whole problem an insoluble riddle!

At the Dowager's request, then, Ralph Swart of Pen Mawth Mill laid down his hat again, and addressed himself to speak. 'For the sake of truth and justice, my Lady,' he said, 'I have come here, and for the sake of truth and justice I will comply with your Ladyship's wish that I should speak out more positively than I have hitherto done. You think me a coward perhaps, my Lady, because I do not choose to make my charges in the young man's presence, face to face, and stand or fall according to their proved truth. Now, I am not good-looking—not nice, as you ladies call it—a queer, cross-grained lump of a man. But I ask your Ladyship, do I look the sort of person to flinch from the angry looks, or words, or blows of any man, be it even your fisherman hero—if I thought fit, my Lady, to confront them?'

As he spoke, he seemed, like some vulture or other bird of prey, to draw back the dull film that coated his fierce eyes, and all the defiant ferocity of his rugged and masculine nature kindled in them at once. Lady Larpent noted

the rigidity of the tigerish mouth, the black frown on the massive brow, and the ominous brightness of the strong man's terrible eyes; and, with female rapidity of logic, she jumped at the conclusion that as her visitor was palpably not a craven, so he was presumably not a rogue. 'I do not believe that you would be easily alarmed,' she said.

'Then credit me, my Lady,' answered the Black Miller, with his ponderous emphasis of diction, 'with telling the truth, until evidence proves me to be a liar. I say that young Hugh, there, is unworthy of your confidence. I intend the young Captain of the *Western Maid* to be his own accuser. Test him! Ask him if, in what he has told your Ladyship regarding his past life, he has kept nothing back. Ask him if it be not true that he is not what he seems. Ply him with fair, simple, straightforward questions, most easy for an honest man to answer, and mark the effect. His own conscience will do the rest. He will be uncertain as to the extent of your Ladyship's knowledge of his antecedents, and you will see him wince, and hear him stammer, and see the red of conscious guilt suffuse that bold forehead of his. If he give you the explanation you have the right—I feel your Ladyship has the right—to demand, then, Lady Larpent, say and think the worst of me that ever was thought. But, if not, thank me for my warning!'

As he spoke, the slouching attitude of the Black Miller grew erect and dignified, his arm was outstretched, and his voice almost lost its habitual harshness, to become sonorous and clear in its fierce earnestness. Then with a bow, not such as rustics give, Ralph Swart took his leave, briefly declining all offers of refreshment, and striding to the outer door before the hurrying servant could reach it in response to the summons of the bell.

'Done the trick, I reckon, unless the legacy of Mother Eve to her daughters has, for once, gone astray!' muttered the Black Miller to himself, as he strode rapidly down the well-kept winding road.

A GLIMPSE OF OVERSEERING IN DEMERARA.

FROM a gentleman of experience in the sugar-estates of Demerara, we have received the following useful and interesting observations. He says: 'As many young men go out to Demerara as overseers on sugar-estates, I purpose putting before those now contemplating such a step the following short statement of what they really will experience on reaching that colony. I am induced to do so from the fact that many young men arrive in the colony to become overseers who are totally unfitted for such a life, and who very soon acknowledge the truth of this themselves. I intend dealing with the profession of a planter only so far as it concerns Demerara—which includes Berbice and Essequibo—and my remarks do not apply to planting as a beginner would find it in the islands. I have, however, good authority for saying that the profession in Trinidad, Barbadoes, and Jamaica for instance, is very much more trying and less remunerative than in

Demerara. The writer has been a planter himself in Demerara for several years, and the information, which will now be placed before his readers may be relied on as correct.

'To commence then. What sort of a place is a sugar-estate in Demerara? A plantation is a piece of land having from three to fifteen hundred acres in cultivation. The usual size of an estate is about nine hundred acres; but the largest—as for instance the plantation Anna Regina in Essequibo—have as many as fourteen or fifteen hundred acres planted in canes; while there are some possessing only three hundred acres, or even less. I may remark here that a beginner should if possible try to avoid getting placed on one of these very small properties. On each estate there are always to be found the following buildings—generally situated close together. 1. A large and commodious manager's house. 2. An hospital for the indentured and resident labourers when sick. 3. The manufactory, termed in local phraseology the "buildings." 4. The labourers' cottages and ranges, including what is termed a Portugee shop. 5. And last, but not least, the overseers' house, about which I shall say a few words. This is generally a long one-storied building on brick pillars, from eight to fourteen feet high, containing four to eight rooms, with a gallery in front about eight feet wide, running the whole length of the house. On some estates these houses are very wretched and old; but they are generally improving.

'The estates are situated from one to eighteen miles distant from Georgetown in Demerara, and from one to nine from New Amsterdam in Berbice, with a few exceptions. The estates on the east coast of Demerara are the most conveniently situated for visiting, as there is a railroad running past them to Mahaica. Mail-wagons however, are in use all over the colony, and the roads, generally speaking, are very good.

'A young man reaches the colony either indentured to a certain employer or merely on speculation, carrying with him perhaps a few introductory letters. In the latter case, it is certainly probable that he may procure a situation as overseer; but in my opinion, a young man has a far greater chance of ultimate success and promotion if he lands in the colony under a three years' indenture to a certain firm. The Colonial Company, London, the Messrs Ewing & Co., Glasgow, and Mr St Quintin Hogg, himself a large proprietor, send out many young men thus yearly. An overseer going out from home under agreement will have his passage paid for him, and be supplied with the necessary articles of furniture for his room on reaching the estate to which he is assigned; whereas an overseer not under one of these three-yearly contracts will have to do all this for himself. The Southampton mail-steamers charge twenty-one pounds for the passage, and sailing-vessels less.

'The writer was not indentured himself, but

has had plenty of opportunities of seeing and judging of the advantage to be derived from such an arrangement. The salary for a beginner is seldom more than fifty pounds per annum, generally speaking only forty pounds; and this is paid quarterly. An indentured overseer usually receives fifty, sixty, and seventy pounds per annum for his three years' term of contract; while perhaps an unindentured man may be in receipt of a larger salary at the end of one and a half or two years' service, as the reward of his industry and steady application to work. In addition to the salary, a pound a month is allowed on all estates to each overseer to defray the expenses of a servant and for washing. The overseers board at the manager's table, who is allowed fifty-two pounds per annum for each. The Colonial Company however, make an exception to this rule, they being more generous, allowing sixty-two pounds, which enables their managers to afford a more liberal diet. This it must be clearly understood is over and above the salary each overseer receives. At the manager's house the overseers receive three meals a day. Few hard-working young men however, find this sufficient, and are obliged to provide themselves with something extra in the way of luncheon at their own expense.

Each manager of a sugar-estate boards the overseers under him exactly as he thinks fit; and I am sorry to remark that some try and do this as shabbily and economically as possible, so that the whole amount allowed them may not be expended, and the surplus serve to defray the cost of any extravagance in which they may have indulged. Those gentlemen, however, who act differently are well known in the colony, and are greatly respected as men who treat their overseers like gentlemen; while the less said about the characters bestowed on the former the better.

Each overseer is expected to be in the "field" in all weathers from seven in the morning, with intervals of rest, to four or half-past four in the afternoon. On large properties, where some of the fields are four and five miles distant from the buildings—the manufactory usually goes by the name of the "buildings"—each overseer is allowed a mule to ride "aback" on. When the field is reached, he dismounts, and the actual superintendence of the work is all done on foot. Some estates have not many mules, and allow *batteaux* (small flat-bottomed punts) instead, with a boy to haul each *batteau* "aback" along the navigation canals, while the overseer sits inside and steers with a paddle.

On Sunday or in the evenings the manager will generally be found willing to lend a mule to an overseer anxious to go off the estate on business or to visit a friend; but it is a distinctly understood thing that no overseer shall leave the estate he belongs to without having first received the express sanction of the manager, or in his absence that of the deputy-manager or head-overseer. Only the very large estates employ a deputy-manager; but every plantation has a head-overseer, who not only is in receipt of a better salary, but enjoys greater privileges than the other overseers. On returning from the field in the afternoon, the books have to

be made up—that is, the money earned by the labourers during that day entered up against their names in the pay-lists, and their names all called over, to ascertain if any have been absent from work without special leave. This occupation takes one or two hours, and sometimes much longer. On Mondays, and sometimes on other days, the work may be a little less arduous than I have described it above; but this is not often the case, and it is frequently much stiffer.

I have now to speak about the night-watches in the manufactory. During crop-time, when sugar-making—or "grinding" as it is called in the colony—is being carried on, the boilers, machinery, and other parts connected with the manufacture of the sugar and rum are constantly at work. Sometimes indeed fire may be hauled from under the boilers for an hour or two in the middle of the night; but generally speaking, the machinery is at work day and night during the period of "grinding." In the daytime an overseer specially set apart for this work takes charge of the manufactory; but the superintendence at night is carried on by each overseer in turn. For instance, if there are five overseers on an estate, each has one night-watch during five consecutive days, and so on for weeks together. If one or two overseers happen to be ill at the same time, the watches follow each other in quicker succession, rendering the work doubly fatiguing. After an overseer has been at work all day and then up all night, one would imagine him unfit to go about his work at all on the ensuing day; but nevertheless he has to do it, and that with the best grace possible. It is needless to say that the consequences of the overseer in charge of the manufactory at night falling asleep may be very serious, and were he detected in such an act, he would receive instant dismissal. These watches are greatly dreaded by most overseers, and do more to make them ill and produce fever than anything else they experience. It is a striking fact that a manager only gets ill perhaps once in six months, whilst an overseer will have been laid up four or five times during a similar period; and it is during crop-time that overseers are nearly always taken sick.

The colony fever, though not often fatal, is a fearful thing in its consequences, utterly prostrating and reducing a man's strength after a few days' illness, and rendering him incapable of doing anything. A sick overseer receives medical attendance, such as it is, gratis; but if ordered wine or other luxuries with which to recruit his strength or tempt the appetite, he will have to provide them himself except in very rare instances. In cases of a very severe sickness or disease attacking an overseer, the manager sends him to an admirable institution in Georgetown called the Seamen's Hospital. A fee of thirty-three shillings a week in advance is asked; and there he receives attendance and every requisite. This hospital, which is open to every one who can afford to pay the above-mentioned fee, is attached to the Colonial Hospital, and a properly qualified doctor is always resident on the premises. There is a similar institution in Berbice, but not so well managed or comfortable as that in Georgetown.

All managers have been once overseers themselves, and a few have been fortunate enough to have obtained managements in so short a period as four and five years after embracing the profession.

The rub then is to keep them. The shortest time however, in which an overseer can hope to become a manager, unless favoured by extraordinary circumstances which seldom occur, is six years; and many have to wait eight, nine, and ten years before obtaining the coveted position. An overseer will have greater chances of accomplishing this by remaining in one employ and bearing up manfully against all trials and disappointments. The colony is full of disappointed planters, who are only too ready to attribute every imaginable thing as the cause of their ill success but the right one.

'He who contemplates becoming a planter should be physically strong, active, steady, and endowed with that rare gift which will be of more use to him than anything else—common-sense. Scotchmen are now and have been for a long time the most successful planters in Demerara, holding the best and most lucrative appointments all over the colony. Such were mostly farmers' sons at home; and young farmers have always appeared to me to be better fitted for, and more able to withstand and cope with the hard work and toil of planting than those reared in any other station in life. Some of the Creoles and coloured men of Demerara make very good overseers, and two or three hold managements in the colony; but they rarely possess the energy and smartness that belong to a European.

'A beginner must expect to meet with what may appear to be great hardships and disappointments in the profession. He may have to put up with indignities and insults from those over him in authority; be always liable to dismissal for trivial mistakes, according to the whim or fancy of the manager for the moment under whom he is situated; and then perhaps, after bearing up against these and other trials, lose his health, as many have done before him. If however, he can overcome all difficulties and keep his health into the bargain, which he will be most likely to do if he abstain from the every-five-minute drinks and swizzles of Demerara, he will surely succeed at last; and the reward it must be remembered is considerable, a manager seldom being in receipt of less than five or six hundred pounds per annum, besides everything found him.

'And now if the reader, being physically fit for the life and inclined towards it, should feel dismayed at this summary of evils, let him not be disheartened, but remember that all occupations carry with them their peculiar trials and drawbacks in possibly as great a degree as does the calling of a Demerara planter. Let him bear in mind that without energy of purpose he can never be successful anywhere.

'I have written this paper in the hope that it will be of use to those in doubt on the subject, by affording them a slight glimpse of what they will have to expect, and by enabling them to judge correctly if they are really fitted for the life they will have to encounter, should they determine to embrace the planter's profession. And lastly, I wish all old planters in Demerara who read this paper to understand that it was not written for their benefit, amusement, or criticism whether friendly or hostile, but solely for those who, not yet planters, are in doubt on the matter, and who do not really understand what Demerara and overseeing mean. And I think

it will be plain to any one from what I have written, that these words mean far more than I have either ability or inclination now to discuss.'

'BEST-MAN' AT A WEDDING.

CALCUTTA, June 8, 187-.

MY DEAR OLD CHUM—In a P.S. added to my letter as the last mail was closing, I told you I had just been foolish enough to promise to be 'best-man' at the wedding of my friend Captain A—, and I said I would give you an idea of how these interesting occurrences are conducted in India—or perhaps I should speak less generally, and say in the 'City of Palaces.' The wedding in question, however, having been a very quiet one, and not on the usual elaborate—and wearisome—scale of Calcutta *wallahs*, it will be necessary to digress a little from the details regarding Captain A—'s wedding, to give you an idea of the general routine.

Shortly before the close of last year, I acted in the same capacity as at this last wedding; and that having been on a large scale, I learned the order of things to be anticipated on getting married in Calcutta, which in addition to giving me the necessary information, created a wholesome horror of ever appearing as principal in a similar scene. Weddings in Calcutta are celebrated either early in the morning or late in the afternoon: generally at the latter time. Small wedding-parties in Calcutta would be considered very large ones in England. On the occasion I mention above, something over two hundred invitations were issued. This is the form, as nearly as my remembrance serves me:

'MR and MRS BROWN-JONES, with compliments to MRS SMITH and family, beg the favour of their attendance at St Timothy's Church on Saturday afternoon next at 5 o'clock, to witness the marriage of their daughter SUSAN MARIA JANE, to MR JOHN THOMAS TOMPKINS.

Cake and wine after the ceremony at No. 6 Guddahwallah Rustah.'

Then for the favoured many—you really cannot under the circumstances say few—who are to tread the light fantastic during the evening and knock themselves up for next day, a gentle hint is added to the invitation just given: 'An evening party at 8.30 P.M.'

The day having arrived, those interested in the couple to be married, or others having a weakness for cake and favours, find their way to church, where the ceremony differs not, I believe, from that performed in England. The subsequent rush for favours most certainly is not less. Those who have received invitations, make their way after the ceremony to the house of the bride's parents, where sundry toasts are proposed, cake and sim-pkin—Anglo-Indian for champagne—go the merry round, favours are stolen, bridesmaids worried, the clergyman surrounded as he does the correct thing

in saying something appropriate, and then every one leaves the house: those so invited, to prepare for the evening party; those who are not, to grumble over the omission and feel dissatisfied. Violinists—or rather, to be common-place, fiddlers—carry on the music during the evening; the bride and bridegroom leave later on; and the party is much the same as would be the case in England, excepting perhaps, that the heat is greater, and the dusky servants in attendance more troublesome. And there it ends.

So much for the generality of weddings. Now for Captain A——'s. On the evening preceding the day itself, I went in company with the bridegroom-elect to dine with the future Mrs A——. I saw much more of the family than of my friend and his bride. (I believe they went into the garden to study botany—it was a full moon—but I am not quite certain.) They appeared on the scene as we, remaining mortal, and not having been travelling mentally in ethereal regions, were beginning to get sleepy; so wishing all 'Good-night,' Captain A—— and I went home. (He didn't say a great deal on the way.) Arriving, inquiries of the kindest—yet somewhat peculiar—nature were made by two or three friends, and we sat up rather late, silently grieving over the last night of Captain A——'s bachelorhood. Although the wedding had been for some time on the *tapis*, its celebration was brought about rather hastily, in consequence of Captain A—— having to leave for another district.

On each side the river Hooghly, a few miles from Calcutta, are several small towns, favoured by newly married couples as resorts to pass that period of supposed felicity, the honeymoon. To one of these—we will say its name begins with Z—Captain A—— had telegraphed a few days previously for a purpose easily surmised. Up to the last night he had received no answer; so it was arranged that I should call upon him as early as possible next morning, and in the event of his not having then heard, that I should go to Z—— and make arrangements. About half-past five next morning, I was walking across the Maidán in Calcutta, and made my way to Captain A——'s quarters. No reply had been received. Taking a conveyance, I crossed the Hooghly into Howrah, and had the satisfaction of seeing the train I wanted leaving the station just as I entered it. In Calcutta railway arrangements, there is 'railway time' and 'Calcutta time'; the former being, I think, the same as Madras, and thirty-three and a half minutes behind the latter. The next train to Z—— left in about three hours' time; so making an early call upon a bachelor friend, I passed the interval. In time not to be too late, I was again at the Howrah railway station, where I found the train waiting.

After a small matter of forty minutes behind time, I arrived at Z——; and inquiring for the next return-train, found I might catch it if I hurried. I got into a gharry—a four-wheel conveyance very similar to a cab—drawn by as miserable a pair of three-quarter-starved, broken-down ponies as ever had the misfortune to behold the light of day. I told the driver to go quickly,

promise of a 'bucksheesh' (Anglicé, a tip) having the desired effect; and telling him to go to X——'s hotel, he did his best to exhaust his strength in 'larruping' the wretched ponies aforesaid most zealously. After driving about three-quarters of a mile, the conveyance stopped at a fair-sized building, but which was closed. This was a great disappointment; and I quite understood then how it was that Captain A——'s telegram had remained unanswered.

With the loss of as little time as possible, I made the best of my way to another hotel, Y——'s, whence after having completed the arrangements for the reception of the 'happy pair' in the evening, I hurried back to the station as fast as the miserable ponies were capable of taking me. I found I was too late. The station-master (a native) said the train had been late every day for the past fortnight, but to-day, for a wonder, had been up to time. I regretted its punctuality. There was no other train until five o'clock; at which hour it was expected that I should be standing at the altar of St ——'s Church, effulgent in a black coat, something nice in the way of neckties, and tender in pants. It was now a little past two o'clock. I knew a boat could not reach Calcutta in time, as the tide was contrary, and the road was far too long for a conveyance to be successful. Whilst considering the difficult situation, I thought I had better let Captain A—— know what was going on. There was a spirit of wickedness in me to frighten him on his wedding-day. I wrote out a message thus: 'X——'s hotel no existence—no other here—self delayed until six.' I imagined the tearing of hair and the distress of my friend as he sent word to his lady that the hour for her sacrifice had not yet come, as there was no place for them to go to. But I remembered the bright blue eyes of the bride, the long attachment, that Captain A—— had seen the roughest phase of this world's ups and downs, and that his own inconvenience or annoyance would be forgotten in regret for unnecessary trouble given to the good lady who was to be his wife that day; so I tore up the form and wrote another: 'Delayed—no X——'s hotel—arrangements made.'

Then came the necessity for making my own arrangements. The line of rail on which I had travelled that morning skirted the river Hooghly. I knew from previous roamings that another line also skirted the other side of the river, and in some places close to it. I sauntered outside the station, and asked the first man I met whether there was a railway station near to the other side. He said there was one directly opposite, and that there were lots of boats to take me across. I knew that on this line trains were frequent on Saturday, because the Volunteers came for rifle-shooting. I went to the station-master and said: 'Babu, it is absolutely necessary for me to be in Calcutta by half-past four, and as your train does not arrive until five, I am going to try the other line. Can you give me any idea when the first train leaves the opposite station?' No, he couldn't; he thought the first train went at half-past six. I called a gharry, and was telling the driver to go as fast as possible to where the boats were. Finding he spoke Bengali, of which I knew but a little, I asked the station-master kindly to tell the man what I wanted. The

station-master's advice, translated, was: 'Go slowly to where the boats are, and the Sahib will give you a bucksheesh beyond your fare.'

I didn't know much Bengali; in fact all I knew of it was from its similarity to another up-country language which I knew pretty well, and which was supposed to be a corrupted version of pure Bengali. By this I was able to understand what the station-master said. I therefore addressed him in what would probably be called the arrogant voice of the rampant Anglo-Saxon, and then drove off in the gharry.

Ah! that conveyance! Its memory haunts me as I write. Calcutta 'hackney carriages' are of three classes. Z—possessed one of the first—always retained by the hotel at which I had arranged for my friend—none of the second, but a more than ample supply of the third. Riding in the last named reminded me of a description of travelling on a camel: 'sitting on a music-stool screwed up to its highest, placed on a heavy cart without springs, travelling on a newly macadamised road, and drawn by a stumbling blind horse.' My unlucky head was constantly coming into contact with the roof of the gharry; an intoxicated man in a superior conveyance would have sat still compared with how I sat; turning corners made me tremble visibly; and all things considered, I almost wished, with a view of equalising my personal misery that day, that I had allowed the first telegraphic message to go! Here was I being bruised and shattered, all because another man was to be married. Enduring that third-class gharry journey must have been as severe to my unfortunate person as I should imagine was the shock, at contemplated matrimony, to my friend's nervous system.

The distance was much longer than I expected; or perhaps, time being so precious, it seemed longer. Passing the hotel on my way, I went in and ascertained about a conveyance for Captain A—. The only 'first-class' one was to be sent to meet the mail-train that night; and lest any other passengers should take a fancy to it, I arranged with the coachman to retain my card until a gentleman accompanied by a lady asked for it, and they would be the right persons to take the gharry. Reaching the ferry station at length, I called for a boat. Several men offered to ferry me. All the boats save one were heavy and cumbersome-looking; so I took the exception, a very small narrow craft. Our destination was exactly opposite; but it was not possible to cross in a straight line. We crept along the bank against the tide for a long long way. The sun was dreadfully hot; my small hat afforded scarcely any protection; I had no umbrella; there was shelter of no description in the boat; so there I had to sit, exposed to the scorching sun of that hot May day, and nearly blinded by the intense glare from the water. It seemed as though an immense furnace had been let loose amongst us. After going a long distance up the river, we got into the middle of it, and then went down with the tide in a slanting direction to our destination. It was unnecessary to row in going down, for our speed was fast enough in itself.

When the boat stopped, I asked the boatmen the direction of the railway station, not seeing it from the river. They pointed it out, or professed to; but being no wiser than before, I asked them to

accompany me, that I might save time. O no! They couldn't think of going in such a sun!

'Very well,' I said; 'then I shall not pay you until I am in the station.'

This had the desired effect; for they rose to accompany me, and we reached the station, running, in about three minutes. I had time only to get my ticket when the Calcutta train was off. I was very tired indeed. What with being up late the night before, early this day, the anxiety, worry, and uncertainty, together with standing in the full glare of the sun in a small hat and without any shelter, I certainly had had quite enough of assisting other people to get married. The train, a slow one, stopping at every station, had nineteen or twenty miles to go, and so I went fast asleep. When I reached Calcutta, four o'clock had struck. I hastened to the house where I was staying, snatched up my clothes, got into a gharry, went off to Captain A—'s quarters—who said as a consolation that he was certain I should not be late—jumped into the black coat and the neat thing in neckties, and was alongside the altar precisely at 5 P.M.

I trust you will not be disappointed at my failing to give a few pages descriptive of the ladies' toilets. Let it suffice to say that every lady looked superlatively nice, and that amongst so much silk, lace, muslin, fans, and perfume, I was considerably confused. This I am sure you will take for granted.

The ceremony over, favours fastened on, names signed, and so forth, we hied to the bride's house. The simpkin had a very soothing effect; for to tell the truth, I felt rather upset. Glancing at the bride and bridegroom, I repented that I had ever been heartless enough to think for a moment of deceiving them with a telegram. Some one came and whispered that I should propose the health of the newly married pair. Speech-making is a thing I have never excelled in, for the simple reason—I have scarcely ever tried it, and I was at a loss to know what to say. Whilst considering, the bridesmaids gave me some cake. They had made me a victim. One refused to believe I was not married, so pinned the favour on the right side of my coat. Another—I fancy she hoped I wasn't—fastened it on the left; so I was resplendent in double rows. My coat-tails were similarly adorned; and according to a recently married lady, I looked like a sheep dressed for Christmas. This ceremony over, the toast again came forward.

'My dear friends?' No; that would not do, because several were present whom I now met for the first time. 'Ladies and gentlemen?' This scarcely reached the tender years of the bridesmaids. There was one resource left, and I availed myself of it as follows. 'Ahem! Never having been either a bride or bridegroom, I am quite at a loss to know what to say. I believe, however, that on painful occasions such as these'—Here came a small shower of corks from the gentlemen; the ladies threw pieces of cakes at me, or rather the icing, which I suppose they thought, being harder, would have a better effect upon my head, which was probably, &c.; and in the general confusion I proposed the health of the bride and bridegroom.

I almost forget how the evening passed. It was late before I began to prepare to get ready to

commence to think about the time. I remember there was music and singing. The wedding had been so hurriedly brought about that but few friends were present; otherwise I doubt not dancing would have been largely patronised. As it was, we enjoyed ourselves wonderfully. The next occurrence was going into supper, which passed in the pleasant manner that such things should. Shortly after, the bride and bridegroom took their departure. They were profusely pelted with rice; a sad proceeding, considering that there was a famine raging in Southern India at the time. Coming in from the veranda, it appeared that I was guilty of being a bride, bridegroom, or some other equally miserable being, for every one commenced to pelt me with rice in the most energetic and undignified manner. For some reason or other I appeared to be a fair object whereon to perpetrate pleasantries (!) of all kinds, which brought the evening's amusement to a happy issue. In fact I began to feel so used up with the duties pertaining to quartermaster in the first place, and master of ceremonies in the second, that I hailed the approaching break-up with secret delight.

Wishing my friends 'good-night,' I got into the carriage kindly reserved for me, and was driven home; and whilst dozing on the comfortable cushions, I thought that it was all very strange. I had gone to church a single being, and was returning home as such. My friends had gone a couple of singles, and left a single couple. Yes, it was strange. Here was I, tired and sleepy; whilst I supposed that the newly—

Excuse this abrupt ending. I did not expect to fill so much space. The postman is in the veranda, and I cannot longer stay. Salaams to all.—Ever yours, S—B—.

RAILWAY CLAIMANTS.

A SERIOUS item on the debit side of the half-yearly balance-sheets of all big railway companies is the amount paid to the public as compensation for the loss or pilferage of, or the damage done to, merchandise in transit or while in the Company's possession. Many thousands of pounds have, as a rule, to be deducted from the current half-year's receipts on this account, although the companies do to some small extent recoup themselves by the periodical sale of all lost and damaged goods of which they find themselves the unwilling depositaries. Another more or less serious item on the wrong side of the balance-sheet is the compensation paid for personal injuries; but with that we have nothing now to do.

In addition to the amount paid in hard cash to the public, the Companies have to maintain a numerous and costly staff of clerks for the investigation and settlement of merchandise claims. This is an item of expense which might be very materially reduced if the claims sent in by the public were, as a rule, just and reasonable ones, or even if they were not in many cases actual breaches of commercial morality—little better, we are sorry to say, than barefaced attempts at

swindling. For even setting aside such claims as may be sent in by people who 'live by their wits,' which but too often means a habitual infraction of the eighth commandment, it would really seem that many otherwise respectable people, who would scorn to rob their neighbours of a penny, and would as soon think of committing suicide as of picking a man's pocket of his watch or purse, become strangely perverted in their views of *meum* and *tuum* when they have to deal with a corporate body like a railway Company. There is an old saying that a 'board' has no conscience; but there are many thousands of people in business who seem to think that every railway Company has a purse, and a long one too, into which, if they can only succeed in dipping their fingers without detection, they are rather to be congratulated than otherwise, as having done a smart thing for themselves without any one being the sufferer by it.

I have been led into these remarks by a little incident which happened to me the other day. I was travelling by railway, when, at a certain station, an old acquaintance, whom I had lost sight of for many years, rushed at the last moment into the compartment in which I was sitting. After mutual recognition and handshakings, we began to compare notes. It was then I learned for the first time that my friend Keene was employed in the Traffic Claims Department of a certain railway Company. In the course of our conversation he supplied me with sundry particulars concerning the duties of his situation, and gave me, in addition, several illustrations of the peculiar phase of commercial dishonesty commented upon by me at the beginning of this paper.

When a claim is sent in to the head-office (said Keene) for loss or detention of, or damage to, goods, annexed to the actual complaint of the public there come certain explanatory particulars from the chief of the station at which the claim has in the first instance been made. As soon as possible after a complaint has been made at a station, either the chief himself or a properly accredited officer goes down to the warehouse or wharf to inquire, on the Company's behalf, into the extent of the alleged loss. This inquiry having elicited a report, the next step is to ascertain where and how the loss or damage originated. It may have originated at the station from which the goods were sent, or even, as not unfrequently happens, before the goods were put into the railway Company's hands at all. It may have taken place in transit, or it may be due to carelessness or accident on the part of some of the Company's servants after the goods were received at their destination. In any case, further minute inquiries have to be made, and in the majority of instances, a number of letters to pass between the two points of transit, before the case can be finally summed up and reported on by the chief of the station, who recommends to the head-office, either that the claim be paid in full, that it be declined *in tota*,

or that the intermediate course be adopted of offering say one-half or two-thirds of the sum demanded by the aggrieved claimants.

It is now that the head-office takes the case in hand and decides what shall finally be done. Each batch of papers is carefully gone through, new points being raised, and fresh correspondence with the station entered into when necessary; and if, after all this, the claim seems to be a really fair and reasonable one, instructions are promptly sent that it shall be paid in full. But should the claim be an unusually heavy one, or should any element of doubt or suspicion have entered into it, some one is sent from headquarters (your humble servant, for instance), who traverses the whole question afresh on the spot, sees every one concerned in the matter, and generally winds up by visiting the person or firm making the complaint, and arguing or persuading them into some reduction of the sum originally demanded.

When a claim arises on goods which have been carried over more than one line of railway, if on investigation it cannot be decided on which particular line the damage occurred, the Companies concerned agree to divide the loss by a mileage proportion in accordance with the distance the goods have travelled over each line. The division in such cases is made by the Railway Clearing-house.

Persons who claim for damage or delay in transit, usually display a strong desire to throw the goods concerned on the hands of the railway Company, by which means they are enabled to claim for their full value. One great point with our officers is to induce the public to accept the goods, sell them to the best advantage, and make their claims for actual loss only. When we cannot succeed in so doing, the goods are stored away at headquarters, there to await the annual clearance sale of all lost and damaged property, unless they be of a perishable nature and require to be sold at once, in which case they are offered to the first likely customer, and the Claims Account debited with the balance of loss on the double transaction.

Some time ago we had two hundred quarters of wheat consigned to a certain firm with whom we had done business once or twice previously. Owing to bad sheeting, two truck-loads of the wheat were slightly damaged by wet. A claim was sent in for the full value of the grain. It then became my business to wait upon the consignee, with the view of inducing them either to receive the whole of the wheat and claim for actual loss only, or to accept that portion of it which was undamaged, and charge us with the value of that which the rain had partially spoiled. They positively declined to accede to either proposition. They threw the whole of the wheat on our hands, ordered a fresh consignment of two hundred quarters, and pocketed their profit on both transactions.

What was to be done? The damaged portion of the wheat would quickly deteriorate with keeping. A customer must be found without much delay. Now, it is a habit of mine, and one which I find rather useful for a person in my position, to keep an eye on the fluctuations of the produce and other markets as notified in the various published price-lists. I was aware that at this particular time grain was slowly but surely rising in

value, great fears being expressed that the coming harvest would be a partial failure. For several days I watched the prices go up a fraction *per diem*. Then, when I doubted the wisdom of waiting any longer, and taking with me samples of the wheat both damaged and undamaged, I made my way as fast as steam could carry me to certain large starch-works in the north where the purchase of inferior and partially damaged grain is a matter of frequent occurrence. I saw the manager, produced my samples, struck a bargain on the spot; and found that, leaving out of consideration the carriage which had to be allowed for, the Company were something like seven pounds in pocket by the transaction.

On one occasion a claim for fifty pounds was sent in, for damage in transit to a large driving-wheel consigned to a well-known firm of Yorkshire manufacturers. Subjoined to the claim came a report from our station-agent, who stated that he had seen the wheel; that the fracture in it was a very serious one; that before the wheel could be used it would either have to be sent back to the founders, or else some skilled workman be sent from there to repair it on the spot; that the manufacturers would be put to great inconvenience while such repairs were being effected, and that in his opinion the claim was perfectly just and legitimate.

Our people at headquarters were inclined to coincide with the views of the station-agent and to settle the claim off-hand. It was only by accident that I saw the papers. When I had read them through, I asked that they might be given to me for a few days, and that the settlement of the claim might be delayed till I had made my report. I hardly know what it was that roused my suspicions in the case, but roused they certainly were. I went down to the station and examined all our people there who were in any way connected with the affair, but still I found nothing tangible to lay hold of. Not satisfied, I went away for two or three weeks about my other business, letting my beard grow meanwhile. Then I went back to H—, and without letting any one at the station know of my arrival, I took up my quarters at a lowish public-house in the workmen's quarter of the town. I had previously rigged myself out in a second-hand slop, a pair of fustian trousers and an old travelling-cap. After this I had not much difficulty in finding out which were the two public-houses chiefly frequented of an evening by the hands employed at the works to which the wheel had been consigned. Being Yorkshire born, the dialect came natural to me.

It was only necessary that I should 'stand treat' now and then, and avouch myself as a 'chap' out of work, as a mate in want of a job, to find myself hail-fellow-well-met with the very men whose acquaintance I was just now desirous of making. Their talk naturally turned a good deal on the 'shop' and matters connected therewith, in all of which I professed to be greatly interested. Were they in want of hands? Was it likely I should get a job if I applied? They didn't know. I'd better see the gaffer. Mappen, I might get takken on.

But the engineer was the man whose company I most affected. What sort of machinery had they? How many boilers? What was the dia-

meter of their driving-wheel? It came out at last what I wanted to hear, either on the third or fourth night after my arrival at H—.

'We had a new driving-wheel a few weeks ago,' said the engineer, a south-country man, as he rapped on the table for another tankard of ale. 'The railway Company contrived to break it, and it was thought at first it would have to be sent back to be mended. However, I persuaded the governor to let me try my hand at it; and with that I fitted a plate over the crack, and contrived to bolt it down so hard and fast that I believe it's now the strongest part of the wheel. Anyhow, there it is at work in the engine-house, and I'll wager my head that it lasts as long as the old one did.'

My friend the engineer was evidently proud of his handiwork.

Shaven and properly dressed, I called next morning on the manager. 'I am from the railway Company,' I said; 'and have called respecting your claim for damage done to your driving-wheel.'

'Yes, to be sure,' responded the manager smilingly. 'Fifty pounds. You gentlemen are rather long-winded in such matters; but better late than never. I will draw up a receipt in three minutes.'

'A receipt for five pounds,' I said.

'For fifty, my dear sir—fifty.'

'What!' said I; 'claim fifty pounds when I happen to know for a fact—a fact, mind you—that this very driving-wheel is now at work in your engine-house, and that the damage done to it was so trifling that one of your own hands repaired it without difficulty at a cost of certainly not more than a couple of pounds for labour, time, and material. We are willing to meet you in a fair spirit, but nothing more. I am empowered to offer you five pounds in full discharge of our liability. If that will not satisfy you, you may take the case into court and leave it for a jury to settle.'

For ten minutes the manager raved and stormed, but at the end of that time he gave me a receipt for the five pounds.

The next case to which I shall refer was one in which the Company were assessed for damage alleged to have been sustained by a printing-press on its way from London to a certain small market-town. The claim was for sixty odd pounds, and was accompanied as usual by the report of our agent at the station. It was stated that the press was so broken as to be utterly valueless, and would have to be replaced by an entirely fresh one. In this case everything seemed so reasonable and straightforward that the claim was paid in full and the matter looked upon as at an end. The conduct of the case had not been mine, and I had only a superficial knowledge of it; but for all that, when I was next at the London terminus and found myself with an hour to spare, I made it my business to find out the address of the senders of the machine. To those senders I went, introduced myself, and then asked them to be good enough to inform me whether such-and-such a press had ever been sent back to them for repairs, or whether another one had been sent to replace it. Neither one nor the other, they told me. They were not even aware that the press had been broken in transit.

A few days later, I found myself at the station to which the press had been consigned. Our agent, on being interrogated, was clearly of opinion that the press had been damaged beyond the possibility of repair, and had been sent back to London; but when requested to trace the back-entry through his books, he was unable to do so, neither could he trace that a second press had been sent to replace the first one. Inquiry in the town elicited that our friend the printer was doing a capital trade for so small a place, and that he seemed to be at no loss for machinery to carry out his orders.

Armed with the information thus obtained, I determined on taking an exceedingly bold step, and that entirely on my own responsibility. When I explained my views to the chief of our detective force, he agreed to join me in the adventure; so, on a certain fine afternoon, we marched together into the printer's shop. We were both utter strangers to the man.

'You do printing here?' I said interrogatively.

'Yes, sir; printing of all kinds.'

'If I were to give you an order of some magnitude, could I rely upon its being completed expeditiously?'

'Without a doubt, sir. No one in the town or neighbourhood has got such a plant as I have, or can turn out as much work as I can in the same space of time.'

'That will do,' said I. 'I am not here to give you an order, Mr —, but to ask you a few questions. I am in the service of the ——— Railway Company, and this gentleman is a detective officer.' Here my friend rattled the handcuffs in his pocket. 'I want to know what has become of the printing-press, for damages to which the railway Company paid you sixty odd pounds on the fourth of last month.'

'The press was so much damaged,' said he, 'that I was glad to sell it for a mere song.'

'Perhaps you can oblige me with the address of the person to whom you sold the broken press?'

The man was very pale by this time, but he answered brusquely enough: 'Perhaps I could oblige you, but I certainly won't.'

'Probably you replaced it with another?'

'I did.'

'From the same firm that supplied you with the first one?'

A moment's hesitation, and then: 'That's my business, not yours.'

'In any case, the second press would reach you by railway. On what date did you receive it?'

'My business again.'

'Am I to understand that you positively decline to answer any of the questions I have put to you?'

Another rattle of the handcuffs. He hesitated, pulled his beard, glanced from one to the other of us, and then spoke. 'Look here, Mr Whats-your-name, the railway Company settled my claim five weeks ago. If they hadn't been satisfied with my statement, they wouldn't have done that. The affair's at an end. I have got my money, and I mean to stick to it.'

'We shall see about that,' said I. 'Look you here, Mr —. The very printing-press for which we paid you over sixty pounds as being irreparably damaged, is now at work in these premises.'

You never obtained a second press either from London or elsewhere." Your claim was an utterly fraudulent one, and you have laid yourself open to a criminal prosecution by acting as you have. However, not to be too hard on you, my friend and I are willing to wait here for a couple of hours; and if at the end of that time, you bring us back the sixty odd pounds obtained by you under such dishonest pretences, I will engage that no further proceedings shall be taken in the matter. But should you decline to accede to this very reasonable request, I shall go from here to the nearest magistrate and obtain a warrant for your arrest.' His bravado vanished in a moment. He vowed and protested that he had not sixty pounds in the world, nor half that sum. He would remit it next week—in a day or two—tomorrow. But he failed to move me from the position I had taken up. Then he put on his hat and went out, presumably to see his friends; and before the two hours were quite over he returned with the money. My detective friend and I went on our way rejoicing.

LAND TELEGRAPH LINES.

WORKING.

In a recent paper we gave an account of the nature and construction of land telegraph lines, especially those of our own country. It shall now be our aim to explain the modes in which they are worked for the conveyance of intelligence.

In each of our great towns there is one central office, through which all foreign and provincial messages pass on their way to their destinations; and a number of local offices for local traffic. At these central offices we see the working of the lines carried out on a great and varied scale; but the essential arrangement of apparatus is the same in all. In all countries the arrangements at central offices are much alike. We shall take as our chief example the metropolitan office at St Martin's-le-Grand.

An important feature of a central office is the *switch* or *connecting-board*. It is a contrivance on which all the lines centring in the office are made to focus. It is generally in the form of a mahogany board fitted with a number of screw terminals, to which the line-wires can be brought. The iron wires of the open-air lines are never themselves brought inside the building; but copper wires coated with gutta-percha or india-rubber are used as connecting-wires or *leads* between the iron line-wires outside and the various instruments within the office. The advantage of a switch is that it enables lines in different parts of the country to be connected-up together, or cross-connected as it is called, and permits a line to be connected to a different instrument for working, if its proper instrument should get out of order—all at a moment's notice, and by the mere shifting of metal pegs or plugs, without the need of disturbing a single wire. At the London Central Office as many as eight hundred lines thus centre on one board.

In the instrument-room the work of transmitting and receiving the messages is carried on. There are several different kinds of receiving instruments in use in the United Kingdom. On the most important circuits, for instance between London and Glasgow, or London and Liverpool, the ink-writing receiver of Morse is used in connection with the automatic transmitter of Wheatstone, and the line is in addition worked on the 'duplex system' of sending two messages *in opposite directions* at the same time. On less busy circuits the 'Sounder' is employed in connection with the duplex system. On circuits where the traffic is great only in one direction, there is no need of the duplex system, and the Morse or Sounder is sufficient in itself. On country and local town circuits, the Single Needle Instrument is used, with or without duplex as the case may be; and in some out-of-the-way places, the Hughes Type-printer or the Bell Instrument is still to be found at work, although they are relics of the days before the lines passed into the hands of the government.

The Morse and Sounder are the instruments principally to be seen in the Central Office, London. They are fixed upon long mahogany tables, at which the operators sit and manipulate them, or work the signalling-keys in sending messages. Twelve hundred operators, chiefly young ladies, are daily employed in the instrument-room, which contains two-thirds of a mile of tables. Batches of messages are distributed to the different operators by means of pneumatic tubes, so that the noise and bustle of messengers in the room are avoided. This large hall, over twenty thousand square feet in area, with its hundreds of beautiful instruments, worked by female clerks, its admirable order and stillness, is indeed one of the sights of London.

The telegraphic circuit is, as the reader knows, composed of the line-wire, the earth, and the apparatus connecting them at each end. At the sending end the wire is connected to the earth or ground by the signalling-key or sending instrument, the battery and the earth-plate all in circuit. At the receiving end the wire is connected to earth by the receiving instrument and the earth-plate there. The signalling-key is a lever or pair of levers worked by the fingers so as to complete or interrupt the circuit, according to the order of signals in the Morse code, and allow certain succession of currents to flow along the line to the distant station, where they will render themselves sensible by their effects on the receiving instrument, and be readily interpreted by the same code. The kind of key employed depends on the receiving instrument. All receiving instruments act by means of some well-known sensible effect of the current. The Morse instrument is one of the earliest of all. In the 'fall' of 1832, Samuel Morse, an American artist, conceived the idea of it while on a voyage from France to the United States, and entered it in his note-book. Three

years later he constructed the first rough working-model; and in 1837 it was first tried on an experimental line between Washington and Baltimore. The principle of the instrument, discovered by Sturgeon, a Londoner, is, that when a current of electricity circulates in an insulated wire round about a piece of soft iron, it magnetises the iron; and the polarity of the magnetism depends on the direction of the current in the wire. When the current stops, the magnetism vanishes; but remains while the current flows. Morse applied this property in the following way. He took a soft iron core wound with a coil of insulated wire, and over one end of the core he pivoted an iron lever, so that when one end of this lever should be attracted downwards to the core, the other end should 'cant' upwards. To this end he attached a small metal disc, smeared in ink, and over the disc he caused to pass continuously a strip or tape of paper. With this contrivance, whenever a current was passed through the coil of the soft iron core, the armature end of the lever was attracted downwards to it; while the other end pressed the inky disc upwards against the paper, on which it left its mark in the form of a line drawn in ink. The length of this line corresponds with the duration of the current in the coil. A momentary current marks a dot on the paper; a longer current marks a dash. Morse combined these two elementary signals the 'dot' and 'dash' into a code of signals representing letters, which now goes by his name, and is even more universal than his instrument, for it is used in connection with all instruments except those which indicate with printed characters. A despatch by the Morse Instrument then, is simply—as we have on a former occasion indicated—a tape of paper with a series of dots and dashes marked along its middle. The speed by the Morse is from thirty to thirty-five words a minute by hand-sending.

The Sounder is merely a modified Morse. The ink and paper are dispensed with, as the clerk reads the message by ear. The free end of the lever is made to tap up and down between two stops of different material, and the difference in tone of the two sounds produced serves to characterise them to the ear. Strange as it may appear, the ear is more easily educated to read by the Sounder than the eye by the Morse; hence the Sounder is growing in favour; partly owing to this and partly because of its simpler nature.

The Bell Instrument—formerly introduced by Sir Charles Bright, and still in use on some Irish circuits—is also read by the ear. It consists of two bells of different tone, and the clapper of each is worked by electro-magnetism, like the lever of the Morse or Sounder. Unlike these instruments however, it is worked by 'double currents'—that is to say a positive current is made to strike one bell, and a negative current the other.

The principle of the Single Needle Instrument is the discovery of Oersted the Danish physicist,

that when a current flows in a wire round about a magnetic needle in the direction of its length, the needle tends to set itself at right angles to the wire. On reversing the direction of the current in the wire, the position of the needle is reversed. It is clear that by the use of positive and negative currents, and the corresponding movements of the needle to right or left of the wire, an intelligible telegraph could be arranged. In 1832 Baron Schilling of Cronstadt found that by coiling the wire a number of times round the needle the force of the effect was correspondingly increased. In 1836 Professor Münck of Heidelberg exhibited Schilling's discovery to his students, among whom was William Fothergill Cooke, a young Indian officer. His was the eye that saw the great value of the discovery as a telegraph. Fired with the idea of its importance, he devised and put in trial at Heidelberg, within three weeks after, a working system of telegraph. His instrument consisted of three coils of wire, each having a horizontal needle free to move on its pivot. He employed three circuits, one for each needle, and by the movements of these needles, made out an alphabet of twenty-six letters. In England he united his plans with those of Wheatstone, and together they brought out the first working system.

The first public line in England between Paddington and West Drayton was opened for traffic in 1838, just forty-one years ago. It was worked by Wheatstone's improved Needle Instrument, which had five vertical needles, required three circuits, and made each signal by the combined movements of two needles at a time. The clever capture of a murderer named Tawell by means of the new telegraph, soon gained for it a wide popularity. The Single Needle is, through the Double Needle, the direct descendant of Wheatstone's Instrument. In it there is only one coil and one vertical needle; it is operated by double currents in a single circuit, and the alphabet is the Morse code, a 'dot' being indicated by a right-hand deflection of the needle, and a 'dash' by a left-hand deflection. The deflections of the needle are curbed by stops. Over three thousand of them are in daily use in the postal service of the United Kingdom; and their well-known forms, resembling an American clock with a green face, are to be seen at almost every railway station. Its speed is from twenty-five to thirty words per minute.

On all long circuits an important instrument is the Relay. Owing to the leakage from a land-line, and the weakening effect of the resistance of the wires, a current in a long circuit is too feeble to work the ordinary receiving instruments such as the Morse and Sounder; but it is sufficiently strong to work a special instrument called a Relay. The Relay is merely a go-between, and enables the weak current in the line to work the receiving instrument by the help of a local battery at the receiving station. As early as 1837, Samuel Morse saw that a current far too feeble to move the

heavy lever and inking disc of a Morse, would be strong enough to move a very light lever, and thereby close the circuit of a local battery which should be strong enough to work the ordinary Morse. This is the principle of the Relay, and the Translator or Repeater, which is in reality an automatic sender. The Relay enables a weak message to work the receiver; the Translator forwards a weak message farther on by repeating it automatically with fresh battery-power. In America they work from New York to Chicago, a distance of one thousand miles, by the use of a single Translator at Buffalo. The most useful European Relay is Siemens' Polarised Relay. On the great Indo-European line it enables London to work with Teheran, a distance of three thousand eight hundred miles, without retransmission by hand.

We come now to Wheatstone's Automatic Transmitter. On lines where there is no great pressure of traffic, the ordinary hand-signalling suffices. A clerk can transmit at the rate of thirty words a minute, or even thirty-five. But there is no reason why the speed should be limited by the quickness at which a clerk can work the sending-key, since the speed of the current on land-lines is practically instantaneous, and automatic mechanism can be made to take the place of the clerk's fingers. All the clerk does in sending is to regulate the succession of contacts between the battery and the line, and this can be done equally well automatically. As far back as 1846, Alexander Bain, a well-known Edinburgh clock-maker, conceived the idea of regulating the succession of contacts by a strip of moving paper punched with a succession of holes, just as the cards in a Jacquard loom regulate the pattern of woven cloth. Bain's idea was taken up and brought to practical success by Wheatstone in 1855.

In Wheatstone's Automatic Transmitter, the message is first punched out in a double row of holes along a tape of paper; the right-hand holes correspond to dots, the left to dashes. This perforated tape is then passed through the automatic key or Transmitter, and regulates the succession of contacts. The contacts are made by two spring plungers, one for each row of holes. As each punched hole passes under the plunger, it falls into it, and makes contact with a metal plate underneath as a hammer falls on its anvil. When the paper space between two punched holes is passing a plunger, it is kept apart from the anvil, and contact with the line is for that time broken. Thus currents of definite length, and from one or other pole of the battery, can be transmitted automatically with great rapidity. The paper is moved by clockwork at any desired speed. The actual rate of sending between London and Edinburgh is sometimes as high as a hundred and thirty words a minute.

Without the Automatic Transmitter the Post-office could not forward the Press Association news. Sometimes as many as four intermediate stations are introduced in circuit, and supplied with news simultaneously at the rate of a thou-

sand words in twenty minutes. A number of clerks can be employed punching several portions of slip, which are one after another passed through the Transmitter in order, the same punched slip serving to send the message over several different lines.

As the Automatic Transmitter increases the speed of sending four-fold, so the Duplex system of working doubles the carrying capacity of a wire. By this system a message can be sent while another is being received, the messages seeming to cross each other on the way. It was invented by Dr Gintl, an Austrian telegraph director, as early as 1853; but subsequently modified by various electricians, and recently revived, after a period of neglect, by Mr Joseph Barker Stearns, an American. In duplex working, the ordinary apparatus slightly modified suffices, and the whole secret lies in the arrangement of it at each end of the wire. There is a receiver in circuit at each end; but it will be sufficient to confine our attention to one end of the line, since the arrangement at both ends is precisely similar. The essential feature of duplex consists in connecting-up to the real line an 'artificial line' or circuit in every electrical respect equivalent to it, and placing the receiving instrument intermediate between them in such a position that the sending current from the battery divides itself into two equal streams, which flow in opposite directions through the instrument, and neutralise each other's effect upon the needle or marker. In this way the sending current setting out from a station does not affect the receiver at that station; one half of it flows along the line to earth through the receiver at the distant station, where it signals, and the other half passes harmlessly to earth through the artificial line at the sending station itself.

The condition that currents sent out from a station shall not affect the receiving instrument there, but shall leave it quite free to be affected by currents coming in from the distant station, is the essential condition of duplex.

We have now to see how it is that currents sent out by the distant station produce their effect at the end we are considering. We have seen that so long as the sending current divides itself equally, and each half flows freely through the real and artificial circuits, no signal is made on the receiving instrument. If however, one of these currents were stopped either in whole or in part, this balance of currents would be disturbed, and the receiving instrument would be affected. This is what the sending currents from the distant stations do. Each signal current sent from the distant station stops, either wholly or partly, the sending current from the near station in the line, and disturbs the balance, so that the instrument at the near station makes a signal. Thus the sending of each station upsets the electric balance at the other, and in this way each station has power to make the receiver at the other to signal.

The duplex system is now in general use on land-lines in America and England. The quadruplex system is a more recent advance, and is also in use in America and England. In 1857, two years after Dr Gintl shewed the feasibility of duplex telegraphy, Dr Bosscha of Leyden expounded the possibility of transmitting two messages in the same direction simultaneously, and

pointed out that by the combination of this system with duplex, a quadruplex system of sending would result. In 1874 Messrs Edison and Prescott of New Jersey invented a thoroughly practicable system. It consists in employing two sending-keys at each end of the wire, so arranged as to give rise to four distinct electrical states of the line, when they are worked together in sending two separate messages simultaneously. These four distinct states are interpreted by two distinct receiving instruments. The duplex or counter system of Stearns is combined with this plan for double transmission; and thus two messages are sent both ways at the same time.

In the ordinary or simplex system of telegraphing, each station sends and receives messages by turns. The operator can by the mere turning of a handle or 'switch' connect-up his key to the line in order to send, or his receiver in order to receive. In the duplex system however, no switch is necessary, since no change in connections is required, and sending and receiving go on simultaneously. This is one incidental advantage of the system; and another is to be found in the facility with which operators can speak to each other and get words repeated. On the New York to Chicago circuit, one hundred and eighty-two American messages—equivalent to one hundred and thirty English messages—are sent per hour by the quadruplex system. On our own circuits worked by the Wheatstone Automatic Duplex, one hundred and sixty English messages are sent per hour; so there is a gain of thirty messages for our method. From thirty to forty thousand messages pass through the Central Telegraph Office, London, daily. Of the daily number, about one-sixth are foreign messages. The two busiest occasions of the telegraphic year are the Derby race-day and the sending of the Queen's Speech.

To provide for the exigencies of the Derby of 1878, a staff of thirty-five first-class hands were sent to Epsom. Six special wires besides the ordinary local wires were employed; and to 'put through' the enormous traffic to and from the field, as many as six Wheatstone Receivers, five Wheatstone Automatic Transmitters, six Morse Instruments, and two Single Needles, were kept at work. In the four days of the races, 15,519 messages—in value L.750, 4s. 8d.—were taken. At Goodwood and Ascot, the traffic is almost as great. The Queen's Speech is however, the more important event; and telegraphists all over the country vie with each other in their eagerness to rapidly transmit the royal address. Arrangements are made beforehand to send it from the central station direct to as many places as possible. It is usual to send it to nearly two hundred towns, including such places as Wick, Oban, Tralee; and to about sixty of these it is sent direct—that is, without retransmission. 'The work of signalling,' says one of the Post-office officials, 'commenced at 2.8 P.M., that being the moment at which the signal to "start" was received from the House of Commons. In a twinkling, the fingers which had been nervously grasping their "keys" for some minutes, came down in the shape of "dots" and "dashes" to the tune of forty words a minute or more (punching); and the Wheatstone Transmitters, wound up to the highest pitch of eagerness, were let loose with their familiar "whir." While we were only as yet looking on to see what it

all meant, "Finished to Leicester!" shouted one excited operator, and "Ditto to York!" shouted another at the same moment. This was at 2.14 P.M. to the moment; so that the nine hundred and eighty-three words of which the Speech was composed were transmitted to these towns in six minutes, or at an average speed of nearly ten thousand words an hour.

'The great towns—Birmingham, Manchester and Liverpool, Nottingham, Leeds, and Bradford—received the Speech simultaneously, on what are called the "express circuits;" and to these the work of transmission was accomplished in the short space of eleven minutes. To Scotland and Ireland—including Aberdeen, Dundee, Belfast, Cork—the Speech was finished within twenty minutes; and to the great majority of places where transmission was effected direct, within half an hour.' In order to send these nine hundred and eighty-three words, fifty thousand separate holes would have to be punched on the Wheatstone slip, and fourteen thousand separate signals would have to be recorded in ink by the receiver at the receiving station.

SWEET VIOLETS.

SENT BY A LADY IN THE COUNTRY TO A FRIEND IN TOWN
(APRIL 29).

BIRCHEN boughs are leafless still,
And the wind is keen and chill;
On the hedges brown and bare
Scarce one bursting bud I see;
Only, in this sunny nook
Scented violets welcome me.

Ah, that fragrance! how it brings
Back old days on rosy wings—
Days when Life's blue sky was clear,
When the simple hearts of youth
Gathered treasures all the year
Of unfading love and truth!

Fragrant are they now as ever;
And as each small flower I sever
From its sheltered woodland home,
Forms beneath the cold earth sleeping
Once more down the pathway come
With glad eyes that know not weeping!

Violets! ye bring to me
Many a sunny memory;
And as one by one I gather
You, the first, best gems of Spring,
Seemeth it to me your sweetness
To sad hearts some cheer must bring.

Friends the token might receive
Your lowliness is meant to give;
So, with wishes true and kind,
I shall send you where the city—
Growing nothing half so fair—
Shall receive with tender pity,
Your small blossoms, sweet and rare!

MUSIC HATH CHARMS.

ONE of the American humorists lays it down as a fundamental law concerning human nature, that we are each of us at some period of our lives subject to an intense desire to play a musical instrument. Upon this text he bases an amusing history of how he himself had once been bitten in that way, and had had in consequence often to shift his quarters, flying from unsympathising landladies and others whose savage breasts utterly refused to be charmed by his well-meant efforts to gain musical proficiency. Jestings apart—there is a substratum of truth in the 'fundamental law' referred to; and most of our readers will acknowledge that they have at some time of their lives really experienced a desire of the kind. It is doubtful whether our very first toys are not most prized if they be capable of making some kind of sound. The eagerness with which a baby will shake a rattle, or later on will blow away at a tin trumpet or knock a drum to pieces, is evidence that even at a very early age noise is far from being distasteful to us.

Watch an errand-boy in any of our crowded thoroughfares. Can he be quiet? Not a bit of it. Noisy he must be, or nothing. Whistling a popular melody with that earnestness of purpose peculiar to him, or with forefingers stretching wide his mouth, emitting a shriek only excelled by a railway engine, he goes on his way rejoicing. Perhaps he accompanies his performance by dragging a stick along the pavings which he happens to be passing, making them ring again. But in some way or other he will have noise, for he delights in it as part of his very nature. As he grows older, he is sure sooner or later to fulfil his destiny and procure some kind of musical instrument. A penny whistle is generally his first investment, and the National Anthem his first tune. Later on, when the period of hobby-hoyhood grows upon him, he affects that dreadful instrument of torture, a cheap concertina. With this, and one or two boon companions similarly armed, he parades the streets when

work is over, and enjoys himself in his own way.

If we examine the contents of a modern toy-shop, we shall find that nearly fifty per cent. of the stock is intended for the production of noise. First we may notice the corals, which no well-conducted baby would condescend to notice unless they were decorated with noisy little bells. Then we have several types of rattle. There is the rattle proper, made of basket-work, and containing some mysterious articles which tinkle whenever it is moved. Then there is the improved rattle, a kind of small drum fixed on a handle, and occasionally crowned with a cap and bells. Next we have drums of all sizes, made of real parchment, and capable of any amount of acoustic display. (By the way, we have remarked that toy drum skins are often covered with legal matter, reminiscences of forgotten lawsuits. It is a question therefore whether some of them were not very noisy subjects before being brought to the drum-head.) Trumpets galore—only capable of producing one solitary note; but that one note is of such distressing nasal qualities that it is more than sufficient to make good all deficiencies. Then comes the harmonicon tribe—plates of brass, glass, or even hard wood placed in a frame and tinkled into melody by little wooden mallets.

Our list is not half complete, for we have not yet touched upon the delicate subject of whistles. We have noticed in this connection with some sadness, that not content with the whistle *per se*, a degenerate custom has lately obtained of attaching surreptitious whistles to other toys. The baby's coral has often this exasperating addition. Riding-whips and pop-guns are also to be regarded with suspicion for the same reason. There is also a numerous class of vulcanised india-rubber dolls and animals which are squeezed into expressing their feelings through a small metallic whistle which forms part of their internal economy.

Another wide field for the invention of noisy toys is comprised in the wire-stringed class. These are generally in the form of carts or wagons, and the peculiarly aggravating feature of their con-

struction is not guessed at until the wheels revolve. This operation is accompanied by a most irritating tum-tumming on three or four wires, which are plucked by bristles on the axle of the wheels. Sometimes the same apparatus is inclosed in a box and is set in motion by means of a handle, with the same pleasurable result as that achieved by one of the old-fashioned London street organs with a monkey. (We mention the animal element with intention; for it is a fact that organs carrying monkeys are invariably more out of tune than those without such appendages. Why this should be the case, we cannot guess, unless it be that the itinerant musician is afraid of spoiling the public by giving too many good things at once.) It would be impossible in the space at our command to enumerate all the toys of a noisy character; but we have said enough to shew that there is an endless supply of them, and it is therefore fair to assume that the demand keeps pace with it.

Now it is a curious fact that the acoustic principles on which the construction of most of these toys is based, were known and utilised by savage nations all the world over for many centuries before intercourse with Europe became possible. Indeed some of their musical instruments—in use at the present day—are of unknown antiquity. Thus the North American Indians make rattles of dried gourds filled with pebbles, an instrument capable of making a formidable noise. Baked clay vessels are also turned to the same purpose. Gourds are used in another way by the Hindus, who attach them to a species of stringed instrument to increase its resonance, in the same way that we employ sound-boards in the present day. Pandean pipes made of reeds seem to be the common property of every nation under the sun; indeed all kinds of pipes and flutes are common to all countries, and in many cases the term flute is applied to all wind-instruments indiscriminately. Savage nations make their flutes either of pottery or bone, the tibia or perhaps the thigh-bone of a fallen foe often furnishing his enemies with music for many years after his decease. And this is not the only case of human remains being turned to musical account, for travellers tell us that drums are often stretched with human skin. Thus savages are not content with belabouring their foes during life, but continue the castigation after they have ceased to exist.

Instruments of percussion, whether adorned with human skin or not, seem to be very favourite things with primitive man. This is no doubt owing to the ease with which such instruments could be made and used. The same reasoning applies to instruments of the harmonicon class, which have been constructed of every conceivable substance from which can be extracted an atom of resonance. Stringed instruments are also found in different forms in all quarters of the globe. The most primitive form is a rough board with a few strings stretched across it. This is the parent of

the dulcimer, which in its turn is undoubtedly the prototype of most of our modern stringed instruments. The older method of procedure was to pluck the strings of all such instruments with a small pointed piece of bone or stick, the violin bow being of later date altogether.

It is a remarkable fact, and one which gives colour to the assumption that the love of music is natural and not acquired, that the various instruments used by savage tribes in widely separated countries are almost identical in character. This shews that the same ideas have arisen and have been acted upon by people who can have had no kind of communication. More than this; where the art has so far advanced as to give a definite structure to instruments, making them capable of affording a regular scale of notes, the particular arrangement adopted is the same in different countries. For instance, in Mexico and Peru we find an instrument which produces a scale of five notes (the Pentatonic scale), sometimes called the Scotch scale, because the arrangement is a characteristic feature of many of our northern melodies. In an opposite quarter of the globe altogether—namely in China, we also find a clay instrument having five finger-holes and giving the same scale.

These facts prove that musical ideas are not the result of civilisation, but are naturally acquired. The same delight with which a child shakes its rattle urges the savage to act in the same manner. It may be imagined that the first step in the process of musical education was prompted by the wish to imitate the calls of birds, either for the mere sake of imitation or as a help to snaring them for the purposes of food. The voice would naturally be the agent employed, until some accident, such as the whistling of the wind through the reeds, or past some favourably placed hole in the rocks, would suggest that art might be capable of producing sounds of louder quality.

It is probable that every nation under the sun has contributed in some degree to the various instruments used in our modern orchestras. We have arrived at a pitch of perfection in their manufacture which renders any great improvement in them simply impossible. Not only has the skill of the best workmen been devoted to them, but the aid of science has also been enlisted in their service. We now know the conditions under which sounds are made manifest to our senses. We can analyse them, and by suitable materials and mode of workmanship, can give them a certain quality or *timbre*, a judicious blending of which constitutes the charm of a complete orchestra. There is no more interesting field of inquiry than this question of the *timbre* of musical sounds. We have no English word to express this quality, and therefore we use a French one; but the great German physicist Helmholtz makes use of a far more expressive term for the same thing—that is, *Klangfarbe*, the English equivalent for which would be *clang-tint*. He tells us that the peculiar

clang-tint of every instrument by which we can identify it is due simply to the number of harmonics or over-tones which fill the air when any one note is sounded. It is difficult for even a practised ear to detect these superposed sounds; but by suitable apparatus their presence in all instruments is rendered audible. In the piano and violin these over-tones follow one another in a regular series. For instance, we will suppose that a certain note on the violin gives five hundred vibrations in a second of time. The over-tones to that note will give respectively twice, three times, four times, &c. five hundred vibrations; and such a series will form the octave, the fifth, the super-octave, the third, &c. of the note sounded. But in the clarionet and other instruments, the harmonics follow a different order, and therefore the *timbre* of the sounds produced is entirely changed. A curious fact in connection with this subject is that Helmholtz's beautiful theory was long ago anticipated in practice by the builders of church organs. In all old organs we find what are called *mixture* stops. In these stops, instead of one pipe to each note, there are three or four; so that when a single key is depressed, a full chord is sounded. Now these pipes are tuned to the harmonics or over-tones of the notes to which they are attached, and therefore add a richness of clang-tint to the full organ.

YOUNG LORD PENRITH.

CHAPTER XXIX.—ON THE LEDGE.

THERE was one lofty cliff, known in local parlance as the Spanish Beacon, that overlooked Treport, and from the peak of which many a fire had probably gleaned forth through the blackness of the night to give warning that some floating castle, with high poop and gilded stern-gallery, and grinning cannon ranged in tiers, and the red and yellow standard of Castile at her masthead, was perilously near the ill-defended coast. In later and more prosaic days the Beacon had been a favourite patrolling place for Custom-house officers and coast-guardsmen, commanding, as it did, a view of more than one creek and cove, and especially of St Mary's Bay, which was screened by high crags from nearly every stand-point but this. To the Spanish Beacon, on the day succeeding that which had witnessed the last fruitless visit to Giles Treloar's lodging-house in Holloway, as well as the enforced self-expatriation of Jan Pennant the fisherman, Hugh Ashton, telescope in hand, made his solitary way.

It was a call of duty, in this case, which caused the young sailor to breast the steep hillside that overhung Treport. A merchant brig, heavily laden, was reported to have got aground in St Mary's Bay; and, although in no present danger, thanks to the fineness of the weather, might require assistance to get her fairly afloat again. Thanks to Hugh's own zealous efforts, the steamer was nearly ready for sea, and there was every chance that on the morrow the *Western Maid* should once more glide out of harbour to render aid to the embayed vessel.

Hugh's spirits rose at the prospect of a more stirring life than he had led of late, and it was with an elastic tread and a quick step that he

climbed the steep road, Neptune bounding cheerily by his side. The great Newfoundland had taken a remarkable fancy to the young stranger—Hugh Ashton was indeed one of those whom dogs and children love—and was fond of accompanying him when he went abroad.

Once on the highest point of the cliff—where a flagstaff, erected by command of H.M.'s Board of Revenue, occupied the spot where once, by sanction of the Queen's Highness, furze and fagots were stacked around the stout tar-barrel that was to apprise Elizabeth's liege subjects of the two religions that tyrant Spain, rich with the gold of Mexico and the silver of Peru, and drawing recruits for her ships and regiments from three European countries beneath the sceptre of the gloomy bigot of the Escorial, threatened their shores with his costly navy—Hugh adjusted his glass, and with a practised eye, surveyed St Mary's Bay. There was work going on, evidently, on board the brig. Carts and horses were busy on the beach, and a black line of men, busy as ants, could be seen to form a living bridge between the ship and the shore.

'They are landing a part of their cargo,' said Hugh, shutting up his glass. 'They will be light, and the rising tide will float them off without help from steam. I don't think, unless the wind shifts and freshens,' he added, taking that deliberate, steady look at the horizon which only shepherds and sailors take, 'that the *Western Maid* will be wanted in St Mary's Bay.—What ails the dog? Why, Nep! Nep!'

Hugh Ashton had some reason for his surprise, since Neptune, ordinarily as staid and majestic an animal, once the first moments of frisky enjoyment at sallying forth were over, as Cornwall could supply, suddenly began to run up and down on the very verge of the cliff, precisely as you may see an intelligent sheep-dog pace up and down an invisible boundary-line beyond which his woolly charge are not to pass. Presently Neptune came up to Hugh whimpering, and thrust his cold nose into the young man's hand; then with a quick hoarse bark, he bounded towards the edge of the cliff, and finding that he was not followed, lifted his head, and howled eloquently. 'What d'ye want Nep, boy?' asked Hugh, walking slowly towards the precipice. Again the dog barked, reproachfully, as Hugh fancied, as dogs do bark when they find it hard to impart their meaning to their human friends. 'I wish Nep could speak,' said the young sailor, as he reached the dizzy edge of the cliff. 'Why,' he exclaimed, as he looked down, and his very heart seemed to stop beating at the sight he saw, 'the dog was right!'

What Hugh saw was, forty feet below, a man clinging, as lizards cling, to a slanting and slippery ledge of splintered rock, jutting from the dull crimson face of the storm-beaten cliff; while, many hundred feet below, gleamed the white line of surf upon the narrow beach studded with jagged rocks, and resounded, hollow and hungry, the low roar of the sea. Some two yards off, beyond the reach of mortal arm, grew in a cleft a withered furze-bush, and this afforded the only branch, or root, or trunk, for a considerable distance to left and right, to which a desperate hand might cling. As for scaling the cliff in front, beetling as it did, a fly might have done it; but neither goat nor

man, nor even the sure-footed hill-fox. And, below, roared and yawned the hungry sea.

Hugh had seasoned nerves, and a sailor's steadiness of brain; but he felt sick and giddy for a moment as he saw the dire peril of the unfortunate one beneath. How the poor creature, whoever he was, had reached the place where he now hung suspended in mid-air, was explained by the rope that dangled, tantalisingly out of reach, above his head. Instinctively, Hugh looked for the other end of the dangling cord. It was made fast to an iron peg firmly driven into the earth near the verge of the cliff, close by which two other coils of slender rope were nestling amidst the rank couch-grass. The dog barked again. Then the man below lifted his pale young face, and Hugh and he knew each other at once. 'Why, Will Farleigh!' exclaimed the former.

'Yes, Captain!' gasped out poor Will, clinging to the ledge. 'All my own fault; I don't deny it. But you see I've had Death for a playfellow so long, that I am like the pitcher that went to the well once too often. These granite cliffs have got crystals in them as sharp as a glazier's diamond. One of them has cut the rope, that rubbed across its edge, as clean as a knife would have done. I went down because the red-legged choughs make their nests still among the fissures, and a Cornish chough is worth two gold guineas any day, at a London bird-stuffer's. And the mother wants port-wine and comforts that—— But I was a fool, wasn't I? Break it gently to her and to Rose, please!'

'Hold on, hold on!' cried Hugh encouragingly, as he hauled in the severed rope, and, with a sailor's dexterity, proceeded to splice it with one of the other coils of cordage. 'I'll lower away, and haul you up with the help of the coast-guard yonder. I see his glazed hat, and the gleam of the pistol in his belt, as he comes on his patrol along the path.'

'That's just what's impossible, Captain Ashton,' answered the bird-hunter despairingly. 'See how I've had to drive my fingers and feet into the earth, to hold on. As it is, they're getting main tired, and soon I'm thinking I shall have to give in, and let go. My hands are cramped and numbed, and I could not spare one to catch at the rope.'

'Then I'll try another plan, returned Hugh; and, hastily making a running noose at the end of the cord, he lowered it over the cliff edge, and taking a firm hold of the rope, went boldly down, hand over hand, availing himself of every projection or angle of the crag on which his feet could rest.

'Ware! You'll go down two hundred yards into that murdering sea!' cried out Will Farleigh unselfishly, as he saw his rescuer swing himself over the giddy depths below. But in less time than it takes to write it, Hugh was kneeling among the gnarled roots of the withered furze-bush, and was leaning forward to pass the running noose around Will's body.

'Let it slip over, so as to take you beneath the armpits. It will never keep firm, else!' cried Hugh. It was a moment of deadly peril to both. There was a fatal fascination tempting the adventurers to look below, where the cruel rocks and the roaring sea awaited their victims, and where the giddy depths of air would have caused the soundest

brain to reel. With no slight risk and trouble the noose was at last slipped beneath the bird-hunter's arms. 'Now, go up, my lad!' said Hugh encouragingly. 'I shall do well enough until you let down the rope for me.'

'I can't do it, with these stiff hands, and joints racked with pain,' gasped out Will Farleigh, who was evidently much exhausted. 'God help me! Save yourself, Captain Hugh, and never mind me.'

'Keep your heart up, and hold on to stone and earth for a minute or two longer, to save a jerk on the line,' called out Hugh; and then, hailing the coast-guardsmen, who by this time were peering over the verge of the precipice, he begged him to make fast and lower away the third piece of cord. The man was quick in complying with his injunction. The rope was lowered; and once, twice, Hugh caught at it in vain; but, the third time it swayed near him, he succeeded in grasping it; and, with surprising boldness and agility, struggled upwards to the beetling brow of the cliff, where the coast-guard, kneeling and stooping over, caught him by the arm, and drew him safely over the edge.

Then came the work of hauling up Will Farleigh from his precarious post on the slippery ledge; a laborious task, since the bird-hunter, expert cragsman though he was, could do nothing in his spent condition to expedite the process; and when at last he stood on firm ground, and the tightened noose was withdrawn, he staggered from physical exhaustion, and was compelled to lean on Hugh's shoulder for support. 'If ever there comes the chance, Captain Ashton, that a man's life would need to be risked to do you a good turn, mine's ready and willing,' said the poor fellow, with moistened eyes, as, leaning on Hugh's strong arm, he walked slowly down the steep path that led to the town. 'But such a near shave as that almost sickens a chap of his trade!'

It was quite evident that Neptune, as with joyous bark and rough gambols he frisked his way down the hill, was perfectly well aware of his own share in the rescue. Once arrived at the cottage, Will told his tale, dwelling, characteristically, but little on his own sufferings, or the fearful suspense he had endured as he hung helpless in the presence of a terrible death, but painting in glowing colours Hugh Ashton's bravery and strength.

And Rose Trawl, coming suddenly forward, caught up Hugh's hand and pressed it to her lips. 'You have saved dear Will!' she said. 'You have been so good and patient with my grandfather! How shall I thank you enough, Captain Ashton, or how shall we all thank you as we ought to do? It seems but the other day that you came among us a stranger.'

Hugh laughed. 'Nep really does deserve some praise, Miss Rose,' said he, 'since but for him we should have known nothing. And Will Farleigh, in time of need, would have done as much for me.'

At this moment there was a knocking at the outer door; and Nezer, the dwarf factotum of the establishment, who went to answer it, returned, carrying a letter which one of the grooms from Llosthuel Court had just brought down.

'For you, skipper!' said the dwarf, handing the letter to Hugh.

'Lady Larpent wishes to see me instantly; she does not say why,' said the young man, as he finished the perusal of some half-dozen lines in the Dowager's bold black handwriting. 'I will go up to the Court at once.'

(To be continued.)

RECOLLECTIONS OF THACKERAY.

IN the absence of any complete biography of the late William Makepeace Thackeray, every anecdote regarding him has a certain value, in so far as it throws a light on his personal character and methods of work. Read in this light and in this spirit, all the tributes to his memory are valuable and interesting. Glancing over some memoranda connected with the life of the novelist, contained in a book which has come under our notice, entitled *Anecdote Biographies*, we gain a ready insight into his character. And from the materials thus supplied, we now offer a few anecdotes treasured up in these too brief memorials of his life.

Thackeray was born at Calcutta in 1811. While still very young, he was sent to England; on the homeward voyage he had a peep at the great Napoleon in his exile-home at St Helena. He received his education at the Charterhouse School and at Cambridge, leaving the latter without a degree. His fortune at this time amounted to twenty thousand pounds; this he afterwards lost through unfortunate speculations, but not before he had travelled a good deal on the continent, and acquainted himself with French and German everyday life and literature. His first inclination was to follow the profession of an artist; and curious to relate, he made overtures to Charles Dickens to illustrate his earliest book. Thackeray was well equipped both in body and mind when his career as an author began; but over ten years of hard toil at newspaper and magazine writing were undergone before he became known as the author of *Vanity Fair*, and one of the first of living novelists. He lectured with fair if not with extraordinary success both in England and America, when the sunshine of public favour had been secured. His career of successful novel-writing terminated suddenly on 24th December 1863, and like Dickens, he had an unfinished novel on hand.

Thackeray's generosity to others in a struggling position is well known. The following are fair examples.

One morning Thackeray knocked at the door of Horace Mayhew's chambers in Regent Street, crying from without: 'It's no use, Horry Mayhew; open the door.' On entering, he said cheerfully: 'Well, young gentleman, you'll admit an old foggy.' When leaving, with his hat in his hand, he remarked: 'By-the-by, how stupid! I was going away without doing part of the business of my visit. You spoke the other day of poor George. Somebody—most unaccountably—has returned me a five-pound note I lent him a long time ago.

I didn't expect it. So just hand to George; and tell him, when his pocket will bear it, to pass it on to some poor fellow of his acquaintance. By-bye.' He was gone! This was one of Thackeray's delicate methods of doing a favour; the recipient was asked to *pass it on*.

One of his last acts on leaving America after a lecturing tour, was to return twenty-five per cent. of the proceeds of one of his lectures to a young speculator who had been a loser by the bargain. While known to hand a gold piece to a waiter with the remark: 'My friend, will you do me the favour to accept a sovereign?' he has also been known to say to a visitor who had proffered a card: 'Don't leave this bit of paper; it has cost you two cents, and will be just as good for your next call.' Evidently aware that money when properly used is a wonderful health-restorer, he was found by a friend who had entered his bedroom in Paris, gravely placing some napoleons in a pill-box, on the lid of which was written: 'One to be taken occasionally.' When asked to explain, it came out that these strange pills were for an old person who said she was very ill, and in distress; and so he had concluded that this was the medicine wanted. 'Dr Thackeray,' he remarked, 'intends to leave it with her himself. Let us walk out together.' To a young literary man afterwards his amanuensis, he wrote thus, on hearing that a loss had befallen him: 'I am sincerely sorry to hear of your position, and send the little contribution which came so opportunely from another friend whom I was enabled once to help. When you are well-to-do again, I know you will pay it back; and I daresay somebody else will want the money, which is meanwhile most heartily at your service.'

Unlike Charles Dickens, he was never happy when he had the prospect of a speech to make or had to act as chairman at some public gathering. One morning his amanuensis found him in bed, and discovered that he had passed a restless night. He was to preside that evening at the dinner of the General Theatrical Fund. His assistant ventured to remark that he was sorry he did not seem well that morning. 'Well!' he exclaimed; 'no; I am not well. I have got to make that confounded speech to-night.' It is well known that his speech at the founding of the Free Library Institution, Manchester, which lasted for but three minutes, when he sat down, was a conspicuous failure. He good-naturedly remarked to a friend afterwards: 'My boy, you have my profoundest sympathy; this day you have accidentally missed hearing one of the finest speeches ever composed for delivery by a great British orator.'

When enjoying an American repast at Boston in 1852, his friends there, determined to surprise him with the size of their oysters, had placed six of the largest bivalves they could find, on his plate. After swallowing number one with some little difficulty, a friend asked him how he felt. 'Profoundly grateful,' he gasped; 'and as if I had swallowed a little baby.' Previous to a farewell dinner given by his American intimates and admirers, he remarked that it was very kind of his friends to give him a dinner, but that such

things always set him trembling. 'Besides,' he remarked to his secretary, 'I have to make a speech, and what am I to say? Here, take a pen in your hand and sit down, and I'll see if I can hammer out something. It's hammering now. I'm afraid it will be stammering by-and-by.' His short speeches, when delivered, were as characteristic and unmistakable as anything he ever wrote. All the distinct features of his written style were present.

It is interesting to remark the sentiments he entertained towards his great rival Charles Dickens. Although the latter was more popular as a novelist than he could ever expect to become, he expressed himself in unmistakable terms regarding him. When the conversation turned that way, he would remark: 'Dickens is making ten thousand a year. He is very angry at me for saying so; but I will say it, for it is true. He doesn't like me. He knows that my books are a protest against his—that if the one set are true, the other must be false. But *Pickwick* is an exception; it is a capital book. It is like a glass of good English ale.' When *Dombey and Son* appeared in the familiar paper cover, number five contained the episode of the death of little Paul. Thackeray appeared much moved on reading it over, and putting number five in his pocket, hastened with it to the editor's room in *Punch* office. Dashing it down on the table in the presence of Mark Lemon, he exclaimed: 'There's no writing against such power as this; one has no chance! Read that chapter describing young Paul's death; it is unsurpassed—it is stupendous!' When *Vanity Fair* was at its best and being published in monthly parts, with a circulation of six thousand a month, Thackeray would remark: 'Ah, they talk to me of popularity, with a sale of little more than one half of ten thousand. Why, look at that lucky fellow Dickens, with heaven knows how many readers, and certainly not less than thirty thousand buyers.'

In a conversation with his secretary previous to his American trip, he intimated his intention of starting a magazine or journal on his return, to be issued in his own name. This scheme eventually took shape, and the result was the now well-known *Cornhill Magazine*. This magazine proved a great success, the sale of the first number being one hundred and ten thousand copies. Under the excitement of this great success, Thackeray left London for Paris. To Mr Fields, the American publisher, who met him by appointment at his hotel in the Rue de la Paix, he remarked: 'London is not big enough to contain me now, and I am obliged to add Paris to my residence. Good gracious!' said he, throwing up his long arms, 'where will this tremendous circulation stop? Who knows but that I shall have to add Vienna and Rome to my whereabouts? If the worst come to the worst, New York also may fall into my clutches, and only the Rocky Mountains may be able to stop my progress.' His spirits continued high during this visit to Paris, his friend adding that some restraint was necessary to keep him from entering the jewellers' shops, and ordering a pocketful of diamonds and 'other trifles; for,' said he, 'how can I spend the princely income which Smith* allows me for editing *Corn-*

hill, unless I begin instantly somewhere!' He complained too that he could not sleep at nights 'for counting up his subscribers.' On reading a contribution by his young daughter to the *Cornhill*, he felt much moved, remarking to a friend: 'When I read it, I blubbered like a child; it is so good, so simple, and so honest; and my little girl wrote it, every word of it.'

Dickens in the tender memorial which he penned for the *Cornhill Magazine*, remarks on his appearance when they dined together. 'No one,' he says, 'can ever have seen him more genial, natural, cordial, fresh, and honestly impulsive than I have seen him at those times. No one can be surer than I of the greatness and goodness of the heart that then disclosed itself.'

Thackeray sometimes made a good point in his replies. He was pestered on one occasion by a young American, who questioned him as to what they thought of this person and that in England. 'Mr Thackeray,' he asked, 'what do they think of Tupper?' 'They don't think of Tupper,' he quietly replied. At the weekly *Punch* dinners, Jerrold and he used to sit together, when the former seemed inclined to wrangle when everything was not to his mind. 'There's no use quarrelling,' said Thackeray; 'for we must meet again next week.'

Beneath his 'modestly grand' manner, his seeming cynicism and bitterness, he bore a very tender and loving heart. In a letter written in 1854, and quoted in James Hannay's sketch, he expresses himself thus. 'I hate Juvenal,' he says. 'I mean I think him a truculent fellow; and I love Horace better than you do, and rate Churchill much lower; and as for Swift, you haven't made me alter my opinion. I admire, or rather admit, his power as much as you do; but I don't admire that kind of power so much as I did fifteen years ago, or twenty shall we say. *Love is a higher intellectual exercise than hatred*; and when you get one or two more of those young ones you write so pleasantly about, you'll come over to the side of the kind wags, I think, rather than the cruel ones.' The pathetic sadness visible in much that he wrote sprung partly from temperament and partly from his own private calamities. Loss of fortune was not the only cause. When a young man in Paris, he married; and after enjoying domestic happiness for several years, his wife caught a fever, from which she never afterwards sufficiently recovered to be able to be with her husband and children. She was henceforth intrusted to the care of a kind family, where every comfort and attention was secured for her. The lines in the ballad of the *Bouillabaisse* are supposed to refer to this early time of domestic felicity:

Ah me! how quick the days are flitting!
I mind me of a time that's gone,
When here I'd sit, as now I'm sitting,
In this same place—but not alone.
A fair young form was nestled near me,
A dear, dear face looked fondly up,
And sweetly spoke and smiled to cheer me—
There's no one now to share my cup.

In dictating to his amanuensis during the composition of the lectures on the *Four Georges*, he would light a cigar, pace the room for a few minutes, and then resume his work with increased

* Of Smith, Elder, & Co., the well-known publishers.

cheerfulness, changing his position very frequently, so that he was sometimes sitting, standing; walking, or lying about. His enunciation was always clear and distinct, and his words and thoughts were so well weighed that the progress of writing was but seldom checked. He dictated with calm deliberation, and shewed no risible feeling even when he had made a humorous point. His whole literary career was one of unremitting industry; he wrote slowly, and like 'George Eliot,' gave forth his thoughts in such perfect form, that he rarely required to retouch his work. His handwriting was neat and plain, often very minute; which led to the remark, that if all trades failed, he would earn sixpences by writing the Lord's Prayer and the Creed in the size of one. Unlike many men of less talent, he looked upon calligraphy as one of the fine arts. When at the height of his fame he was satisfied when he wrote six pages a day, generally working during the day, seldom at night. An idea which would only be slightly developed in some of his shorter stories, he treasured up and expanded in some of his larger works. When he received an adverse criticism, he remarked in a letter to a friend regarding it: 'What can the man mean by saying that I am "uncharitable, unkindly, that I sneer at virtue?" and so forth. My own conscience being pretty clear, I can receive the *Bulletin's* displeasure with calmness—remembering how I used to lay about me in my own youthful days, and how I generally took a good tall mark to hit at.' That he felt the gravity of his calling is evident from a reply written in 1848 to friends in Edinburgh, who, presaging his future eminence, had presented him with an inkstand in the shape of a silver statuette of 'Punch.' 'Who is this that sets up to preach to mankind,' he wrote, 'and to laugh at many things which men reverence? I hope I may be able to tell the truth always, and to see it right, according to the eyes which God Almighty gives me. And if in the exercise of my calling I get friends, and find encouragement and sympathy, I need not tell you how much I feel, and am thankful for this support.'

While Alfred Tennyson the future Laureate received the gold medal at Cambridge given by the Chancellor of the university for the best English poem, the subject being *Timbuctoo*, we find Thackeray satirising the subject in a humorous paper called *The Snob*. Here are a few lines from his clever skit on the prize poem:

There stalks the tiger—there the lion roars,
Who sometimes eats the luckless blackamoors;
All that he leaves of them the monster throws
To jackals, vultures, dogs, cats, kites, and crows;
His hunger thus the forest monarch gluts,
And then lies down 'neath trees called cocoa-nuts.

The personal appearance of Thackeray has been frequently described. His nose, through an early accident, was misshapen; it was broad at the bridge, and stubby at the end. He was near-sighted; and his hair at forty was already gray, but massy and abundant; his keen and kindly eyes twinkled sometimes through and sometimes over his spectacles. A friend remarked that what he 'should call the predominant expression of the countenance was courage—a readiness to face the world on its own terms.' Unlike Dickens, he took no regular walking exercise, and being regardless of

the laws of health, suffered in consequence. In reply to one who asked him if he had ever received the best medical advice, his reply was: 'What is the use of advice if you don't follow it? They tell me not to drink, and I *do* drink. They tell me not to smoke, and I *do* smoke. They tell me not to eat, and I *do* eat. In short, I do everything that I am desired *not* to do; and therefore, what am I to expect?' And so one morning he was found lying, like Dr Chalmers, in the sleep of death with his arms beneath his head, after one of his violent attacks of illness; to be mourned by his mother and daughters, who formed his household, and by a wider public beyond, which had learned to love him through his admirable works.

TOO LATE TO SAVE, BUT NOT TO AVENGE.

A STORY OF THE LAST BASUTO WAR.

It was evening, and for about the space of four hours the earth had been enveloped in almost Egyptian darkness. One by one the stars resumed their silent vigil in the dark canopy overhead, like so many sentinels mounting guard over the weary and travel-stained warriors who slumbered on the plain beneath. All day we had been scouring the country, under a fiery African sun, in quest of small parties of the enemy who might have felt inclined to cross the frontier on some marauding expedition. A small band we were—only about one hundred and fifty strong; and when darkness overtook us, many miles yet lay between us and the camp of our comrades. Inwardly bemoaning our hard fate, we turned our horses' heads towards an open part of the country where we could encamp for the night, safe from a surprise from our wily foes. We lighted no tell-tale fires; but each man, with the hard ground for his couch, his saddle for a pillow, and the sky his only covering, tired and supperless, stretched his weary limbs beside his jaded steed, and with the exception of those on guard—who lay in pairs upon their faces a short distance apart from the main body—were soon all fast asleep.

Two days before, we had left the town of Winberg behind, and marching in a south-easterly direction, fully intended to have reached the camp of Ta-Bosego on the night in question, where both troopers and horses might have reasonably expected better than their present fare; but before many hours passed away, we had reason to be thankful for our previously considered misfortune. The darkness had gradually given place to a comparatively clear starlight night, when suddenly the stillness was broken by the sharp clear challenge of a sentinel, accompanied by the ominous clicking of rifle-locks. A reply came back in the Dutch language: 'Do not fire. I am a peace Kaffir, and alone.'

He was allowed to approach; and a glance satisfied us he was really what he represented himself to be; but from some cause or other he was evidently in a state of great excitement. Inquiring

into the cause of his disquietude, his story was soon told. Within an hour or so of sundown, a band of over two thousand Basutos, under the command of Pollos Moperrie, a son of the chief, came up to the kraal where they were located, and under the guise of friendship, induced them to lay aside their arms and prepare some food for himself and his captains. A bullock and several sheep were immediately slaughtered by the unsuspecting peace Kaffirs; and within a short time after their arrival the Basuto leaders sat down to a comfortable repast, generously provided them by the friendly natives. Upon the conclusion of their meal, at a private signal from Moperrie, his savage host fell upon their entertainers, who, before they could obtain possession of their weapons, were murdered in cold blood, old men, women, and helpless infants being stabbed to death by the assegai, or hacked to pieces by their murderous chakas (battle-axes); finishing off by burning the huts and driving off the stock of their victims along with them. The only crime of which these poor people had been guilty was an enormous one in the eyes of Moperrie—namely that of living within the limits of Free State Territory and not rising in arms against its subjects. Our informant, who suspected treachery on the part of the Basutos from the outset, had been engaged at the time of their arrival in driving in some goats from the *veld*, and had contrived to slip into the cover of the friendly bush unobserved, whence he had been an eye-witness of the terrible scene.

During this recital, anathemas could be heard falling freely from the lips of the troopers upon the head of the savage commander, a fiend in human shape. A thrill of horror ran through the men when they learned from the Kaffir that the enemy had resumed their march in a north-easterly direction. The town of Brandfort lay in that quarter, only about three hours' ride from that last scene of slaughter, and no doubt could be entertained that it was their destination. The very thing we were here to prevent; and if darkness had not overtaken us when it did, we must have crossed their track, and gained at least six hours of valuable time; every moment of which, unknown to us, had been of the greatest importance. The town was utterly defenceless; women, children, old men, and invalids constituting at the time its entire inhabitants. All the men capable of bearing arms were then *on commando*, or in other words were volunteers and soldiers serving under the republican flag; and in fact the place contained all that was near and dear to many among ourselves. Fathers and mothers, brothers and sisters, sweethearts and wives rose up before our minds supplicating in vain for mercy at the hands of their savage foes, until blood-thirsty feelings sprung up in our breasts which would have done credit to the instincts of the sable warriors themselves. Ignoring our numerical inferiority as compared with the enemy, we sternly resolved that if too late to save we would at least avenge them.

On went the saddles; and away we sped across country in the direction of Brandfort, straining our eyes to catch the first glare of fire upon the sky,

which might proclaim we were too late to save. But our hopes began to rise as nearer and nearer we drew to the place without sighting that much-dreaded sign. Gray dawn was breaking as we halted our weary steeds upon the Winberg road surmounting the hills overlooking the valley in which stood the town of Brandfort. No sound came from the valley indicating the presence of either friend or foe; all was silent as the grave. Impatiently we awaited the return of the scouts who had been sent forward to reconnoitre, cheerful to a degree; for if the enemy was in the valley below, their escape was effectually barred. Before them lay a comparatively clear and level plain, stretching away towards Bloemfontein; while behind them were the mountains, the summits of which were in possession of their vengeful opponents. The scouts returned to inform us that they had actually entered some of the houses in the outskirts of the town, which in some cases betokened the hasty flight of their inhabitants, and in others the recent presence of the pilfering savage. The sun had by this time arisen which was to look upon a terrible and sanguinary lesson in store for the hoary chieftain of the Basutos, and whose setting rays were destined to view his chosen warriors stretched in death by hundreds upon the plain, and their leader and his favourite son a captive in the hands of his detested white foes.

Remounting our horses, we rode into the town, where we had plentiful indications of the presence of the enemy, in the shape of the household effects of the inhabitants strewn about the place. The residents had saved themselves by flight before the arrival of the enemy in the place, having suspected their presence and intentions through the glare of a recently burned kraal having been perceived by some of the native shepherds from the hill-top above the town. This circumstance had doubtless been the means of withholding the marauders from burning the place, so as to allay the fears of the fugitives, whom they expected—seeing nothing unusual occur during the night—to remain in the immediate neighbourhood of the town; when daybreak would disclose their whereabouts, and they with their cattle would become an easy prey. Too well skilled in the tactics of the Kaffirs however, the good folks of Brandfort had pushed steadily on through the darkness in the direction of Bloemfontein, and before daybreak had placed a good many miles between themselves and their deserted town. At dawn of day the enemy was on their track, little imagining he was hurrying on to his own destruction, and blissfully unconscious that the avenger was already close upon his heels.

Emerging from the south end of the town by the Bloemfontein road, we pushed smartly across the plain, and soon gained the top of a low range of hills a few miles distant, when, as we expected, we got our first sight of the enemy in the open country beyond them; and about two miles ahead of the Kaffirs we perceived at the same time the white-tented wagons of the fugitives. Overjoyed at finding them safe as yet, it was our intention not to charge the Kaffirs, who far outnumbered us, and thus imperil the safety of our friends, but to get between the two parties, and cover their retreat for a few miles; while the enemy could scarcely be so imprudent as to follow much farther in that direction. They awaited our onset in

silence; and making a feint at the left of their line, so as to concentrate their attention upon that one spot, we advanced towards them at a sharp trot, intending to wheel round by their right, and so attain our object. We had scarcely started, when our attention was attracted towards a body of men emerging from the bush skirting the banks of a river beyond the enemy, and who were instantly recognised by us to be the Bloemfontein Volunteers. The Kaffirs at the same time perceived that this sudden change of affairs had at once rendered their situation critical, if not hopeless. Their minds were soon made up; and in the vain hope of cutting their way through and gaining the hills, they advanced in our direction.

On they came, slowly at first, then with a rush, rattling their glittering assegais upon their shields, leaping and yelling as only Kaffirs know how to yell, and stopping within a few yards of us to let fly a shower of these deadly missiles; when we discharged our double-barrelled rifles full in their faces, the effect of which sent many a sable, ostrich-plumed warrior rolling in his tracks; then, with a ringing British cheer—we were mostly English Volunteers—we dashed into their shattered front. Breaking the shaft from the stabbing assegai short by the blade, so as to convert the weapon into a formidable dagger, they fought with the desperation born of despair. With these they thrust viciously at our horses and men, the once bright but now dimmed blade of whose sabres gave a good account of their savage opponents. Soon the steady crash of rifle-fire told the fight was raging fast and furious in another quarter of the field, and 'every man for himself' immediately became the order of the day with the Kaffirs.

They broke in disorder, and flying across the plain in all directions, were overtaken by our vengeful horsemen; while many rushed into an adjoining marsh, afterwards called Fir-Keirde Vley (the Wrong Spot), to escape their vengeance, only to add their numbers to those already slain, by the rifles of the Volunteers. Their rout was complete; and it was only the setting sun that staid the pursuit and put an end to this terrible fray which was mainly instrumental in bringing the war to a termination. Their leader had only saved himself from death by taking refuge in a wagon among some of the women and children, and there besought his intended victims to hide him from the vengeance of the soldiers; for had he attempted to escape from the field when the fight was at its height, he would have been marked out by his dress, and in all probability fallen a victim.

The opportune arrival of the Volunteers was in obedience to an order received from the seat of war to march at once to the defence of the town, information of an intended attack upon the place having been gained by two spies from some of the Basutos themselves. We bivouacked for the night upon the field, as the horses in some cases, owing to the great exertions so recently imposed upon them, actually tottered from fatigue under their riders; while the troopers themselves, from want of food since the previous day, now that the excitement and danger were past, were as far spent as their jaded steeds. There was abundance of stock at hand; and willing hands were soon at work preparing a meal for the rescuers; after which and

a good night's rest, they were ready by the rising of the sun to view the terrible battle-field.

Our loss was trifling; but in many places the ground was thickly strewn with the dying and the dead enemy. In the vley where they made their final stand, they lay across each other in some places to a depth of five and six. Some of the slain savages presented a grotesque sight, which under other circumstances might have drawn a laugh from our ranks. Here lay a young man whose only clothing was a lady's crinoline of bright scarlet, which he had donned for the adornment of his stalwart figure, having fastened it round his neck, and stuck his arms through between the bars. A few yards farther off, reclining against the body of a dead horse, sat another dead warrior, his head surmounted by a white dress-hat with a deep crape band round it; and within arm's-length of him lay one of his comrades, whose dress in all likelihood belonged to the original owner of his companion's hat, and consisted of a black dress-coat, a dirty paper collar fastened round his bare neck by a strip of skin passed through the button-holes, and a pair of silver-plated spurs strapped upon his bare heels; while fastened in his hair were a number of fine black ostrich plumes. These and nothing more constituted his rather peculiar costume; while others were masquerading in ladies' bonnets, hats, &c. Laughable as these grotesque uniforms might have appeared to us at another time, the effect was far different then. Their appearance upon the bodies of the now harmless warriors told of the dangers which their former wearers had escaped almost by a hair-breadth.

The enemy who survived that day of reckoning made their way with all haste back to Basuto Land, the bearers of far different news than was anticipated by their chief. Some of them coming across an outlying farm in their flight, made the attempt to secure some memento of their visit in the shape of the cattle which were shut up in a kraal adjoining the house. The peace Kaffirs about the place had each been supplied with a strip of white cloth to be worn round their hats, so as to render them distinguishable at first sight from the enemy. This, by means unknown, must have come to the knowledge of the enemy; for about midnight a Kaffir wearing that distinguishing badge approached the cattle kraal, and commenced to undo the fastenings of the gate; and if he had been successful in his object, the oxen would have walked quietly out one by one, and been driven away in the darkness. The design was frustrated however, and the attempt cost the would-be cattle-lifter his life. Crouching behind the wall on each side of the gate were two peace Kaffirs on guard, minus the white band, which rendered them less noticeable in the darkness, and who were attentively and suspiciously watching the movements of the wearer of that badge of peace on the outside. Stepping inside, he was recognised at once to be a Basuto; and in another instant he lay dead, pierced through the heart by the assegai of one of the peace Kaffirs. The alarm was raised, and a few shots were discharged into the darkness from the windows of the house, which had the effect of driving off the remainder, who although they had the courage left to steal, had none to fight, after the terrible lesson of a few hours before. That was the last we

heard of them upon that occasion. They retired within their own territory, after an unsparing measure of vengeance had been meted out to them for the slaughter of our black allies, whom we came too late to save, but not to avenge.

A NIGHT IN LLANTHONY CHURCH.

FOR the first time in his life the writer has experienced the sensation of spending a night in a church. How he came to do so he proposes to explain. The descriptions of Llanthony Abbey and of its singular site, given by the old chroniclers, as well as those of later authors, had long since excited his curiosity; but it was not till the occasion of which he has now to speak that he was able to put his design of visiting it in practice. Llanthony lies far from the ordinary track of tourists; and from the nearest railway station—that of Llanfihangel, on the line from Hereford to Abergavenny—the only means of transit to be procured was found to consist of a solitary farmer's cart. But this, after some difficulty, the writer and his companion secure. Our way lies up the deep valley of the Hondy, close beside the rushing river, and between the vast, steep, and in some places precipitous masses of the Black Mountains. The valley for some miles is little more than a defile, with little of interest except the rude, bold mountain-wall on each hand.

But presently the scene suddenly changes. As we turn somewhat to the westward, the valley opens before us to quite a respectable breadth. It now reaches, in the words of its oldest describer, to 'a bow-shot's width.' Fine forest trees are interspersed with green pastures; and above them, on a slight elevation north of the river, tower up great gray cliffs of stone which now mark the once famous minster of St John the Baptist of Llanthony. As we near it, we quit the main road, mount a somewhat steep ascent, and are driven into a large grassy court-yard. Everything around us wears an air of neatness, yet there are ruins on all sides. We have entered at the bottom of the court-yard, through a wall whose stones betray that they have once supported a groined roof. To the right, the rude architecture of comparatively modern farm-buildings contrasts strangely with the shapely shafts and sculptured capitals among which they nestle. To the left is a small house with its offices, old and quaint in themselves, yet things of yesterday compared with the massive Norman stone-work on which they are ingrafted. The upper side is bounded by a noble arcade, which once supported the nave of the great church.

We draw up before a low archway in the north-west corner of the quadrangle. Its door stands open, and admits us to a long low room, roofed with the stone barrel-vaulting of the twelfth century. It is cosily furnished in a rustic way, and is lighted at its farther end by a fine Norman window. It once formed part of the abbot's lodging, and is now the half-kitchen, half-bar of the little inn of Llanthony, one of the most curious houses of entertainment at which, in his journey through life, it has ever been the lot of the writer to halt.

As the sun is now fast sinking behind the Hatterills, we are well pleased to learn that some sort of shelter can be given us for the night; and whilst a meal is prepared, we take a quiet stroll among the ruins. The great roofless minster is no bad place for contemplation in the twilight hour. The turf within is short and even; one may pace it without being impeded by fallen stones, or one may sit and meditate on the defaced tomb of some old benefactor or abbot. Solemn the place may be, but it is at the same time beautiful in its decay. The crumbling walls are crowned with ivy, whilst from every chink and cranny hang festoons of tiny blue flowers. Hundreds of martins have hung their nests beneath the arches of the great tower; and they, with their twitterings and restless wings, alone break the quiet of this peaceful spot. We pass an archway in the southern transept, and find ourselves in a trim garden. It is gay with flowers, and fruit-trees are nailed to the old Norman walls. There are vegetables in abundance, and the leek still flourishes on, perhaps, the very spot where St David raised it for his hermit fare, and thus consecrated it to become a national emblem. We make some little circuit to obtain a view of the western front. Before it we find that there is a farm-yard, in which some fine Herefordshire cows are being milked by the farmer's pretty daughter and a maid. The young lady is as daintily dressed as if she were sitting for her portrait in a mock-pastoral by Watteau. But she is in earnest about her work, and only with difficulty is to be drawn into conversation. She in her light dress and hat, the red cows with their white faces, the gray Abbey towers, and the dark mountains as a background, form altogether a picture worthy of the art of a Royal Academician.

But the thin air of the hills makes us hungry. We return to the grassy courtyard, once doubtless the cloister garth. A flight of stone steps leads from it to an outhouse, a kind of storeroom, having a sloping roof. The most attractive of its contents are some sacks of fragrant malt. From this a door opens into our sitting-room, an old, low, but not uncomfortable apartment, with a large window looking into the quadrangle. And now we find that healthy appetites, edged by mountain air, can conquer the toughest mutton.

The meal finished, we again stroll forth. By this time the harvest-moon, full and round and red, is looking down upon us over the eastern ridge of the Hatterills. What fair Melrose may be when visited by the pale moonlight, the writer has never experienced; but he is of opinion that it can scarcely be more beautiful than Llanthony under similar circumstances. Hours pass, and we are still lingering among the ruins. Grand and picturesque as are these walls by day, they are doubly so under those sharp lights and deep shadows which the moon alone can cast. Nor by day is the vast belt of mountain, with its undulating outline, which on all sides incloses us like a colossal cloister, half so overpowering. By this dim light the summits of the hills seem even more closely than ever to shut in from all outer and less hallowed influences the chosen resting-place of the patron saint of Wales. Well might Roger, Bishop of Salisbury, seated at table with Henry I., declare that not all the gold in the

king's treasury would suffice to build so magnificent a cloister as that with which the monks of Llanthony had surrounded themselves!

Leaving the ruins, we descend the track by which we had at first approached them, and follow the main road in its upward course. After a short distance, however, it turns to the right and climbs the bank till it reaches the level of the Abbey. Here it seems suddenly to end at the high gable of a building which is overshadowed by a grove of trees, and has in front of it two ancient yews. We approach, and then find that the road, as if by an afterthought, abruptly turns to the left when it has reached this gable, and proceeds up the valley. But this was indeed its original termination; for this building, now a barn, was the great gateway of the abbey. Its broad archway is walled up, but not hidden from sight, and the ornamented windows above are still open. Standing in the shadow of its trees, with its dark yews before it, this old gateway has a mysterious interest in the moonlight.

Slowly we retrace our steps. All is silent except the ever murmuring Hondy, and the owls which are hooting dreamily to each other from wood to wood. The shattered minster stands gleaming and quiet in the moonlight. The martins are all asleep in their nests under the great tower. It seems hard to leave this scene of solemn beauty, but it is time that we, like the martins, were retiring for the night.

But, as regards the writer at least, this retiring to rest was a far less easy matter than with the martins. 'Here we go up; here we go down; here we go round, around, around,' would seem to be the rule by which to get to bed at Llanthony. To reach my allotted sleeping-place, I walk along a passage and ascend a crooked stair; then I traverse another passage, evidently across a vaulted ceiling, and descend a second stair; presently I find myself in the narrow corkscrew which threads the south-west angle of the south-west tower of the Abbey church, and then I begin to climb in earnest. The turnings of this spiral seem endless; but at last I reach its top, and enter a tiny room—my bed-chamber—in form something like a bee-hive, if a bee-hive could only be square at bottom instead of round. The door is placed in one of its angles. The arrangement of the solitary window-aperture is unique, being nearly triangular in shape, and reaching upwards from the floor some three feet. Through it, however, a bright ray of moonlight enters, and as I cannot look out in a standing posture, I fall on hands and knees and creep into the aperture. It is like creeping through a miniature tunnel, for the wall is several feet in thickness. Under these difficulties I reach the casement and peep out.

I am well repaid. My cell is in the very summit of the south-west tower, and my queer casement is the apex of the tall Gothic window in its eastern front. From this great height I am looking down into the south aisle, and aslant the nave of the ruined church, where the moon is throwing the long shadows of broken arches across the grass which covers the bones of abbots and Norman barons. The extremity of the aisle is beneath my feet; and now it first occurs to me that my lodging is actually within the sacred building, that my bed is above the graves of the dead, and that I am really about to spend the

night in a church. From this altitude the ruins form new and picturesque combinations in the moonlight. Under some circumstances I might be inclined to gaze upon them unwearied; but the fact is that I am less practised in kneeling than were the old ascetics of Llanthony. My position is decidedly uncomfortable, so I creep backwards from my tunnel. My bee-hive looks clean and cosy. The walls are the freshest of whitewash. The furniture of my small bed vies with them in purity. The bed itself does not feel uncomfortable. At least I shall rest more at ease than did the good knight, Sir William of Llanthony, who in the days of Rufus used his iron armour as a night-shirt, till it was eaten away by rust. Musing of him, and of St David, and of the monks, I fall asleep. Not one of the sainted dead who rest beneath rises to trouble my slumbers. No ghostly terrors attend my first night in a church.

Giraldus Cambrensis, writing of Llanthony towards the close of the twelfth century, observes that so great is the height of the surrounding mountains, that the sun rarely appears to rise before the 'first hour of the day.' At the stroke of seven I am again upon my knees in the tunnel at my airy look-out, when the first rays of the sun, as he rises above the Hatterills, fall on my face; and I am well pleased to note so exact a coincidence with the words of the old chronicler. I emerge from my cell and descend a few steps of my corkscrew stair. An opening presents itself to the left, and I explore it. It is merely a passage in the thickness of the wall, and so narrow that I have to move edgewise. It needs no history to tell us that these stairs and passages were built in those early and exacting times when the monks fasted much. Those jolly members of the brotherhood of whom we read in later days as feasting on the fat of Gloucestershire, could never have squeezed through such openings as these. Perhaps that was one reason why the brethren accustomed to the Gloucestershire Llanthony objected so strongly to this, their mother Abbey. I make my way through the western and northern sides of the tower, and see before me the open light of day, broken only by hanging curtains of ivy. These I push aside, and step out upon a projecting crag of masonry. Far beneath me to the left lies the nave; to the right, the southern aisle. I am high above the great arcade, above even the broken windows of the triforium; I am on a level with the long since vanished clerestory, with which this passage formerly communicated. Mine is a commanding position, but it is a giddy one, and I am not long before I leave it.

In the course of the morning we make a fuller examination of the ruins. The two massive towers which flanked the western front of the Abbey church are still entire. Little of the aisles remains; but the six fine pointed arches, with the rounded ones of the triforium above, which formed the northern side of the nave, still stand. The arches on the south are more broken. The western and southern sides only of the great central tower are left. Much of the northern transept is gone; but that to the south, with its fine double Norman window, is almost entire. To the east, the once famous great window is now but a shapeless gap between the two masses of stone-work, which, with their flat Norman buttresses, form the

corners of the building in that direction. Beyond the southern transept, and mostly converted into farm-offices, are considerable remains of the refectory and some other monastic buildings.

In one respect, Llanthony differs from almost every other great ecclesiastical structure of ancient date in the kingdom. In most of our cathedrals and minsters we can trace the several changes in architectural taste which developed themselves between the Norman Conquest and the Reformation. Here, however, everything is of a single period. It was in the twelfth century that this Abbey at once rose to its greatness, and that in a few years it as suddenly began to decline. Hence all its architecture is of that mixture of the Rounded Norman and Earliest Pointed styles known as the Transitional. The cause of the early decline of Llanthony was chiefly the troubled state of the Welsh Marches at the period. It became anything but the abode of peace, and the monks were forced to withdraw. Thus a second and more secure Llanthony sprang up at Gloucester, which from that time forward attracted the brethren and diverted the revenues from the older establishment. The mother-church was stripped of even its bells and ornaments; and Llanthony Prima becoming a mere hospital for the infirm, and place of discipline for the refractory among the brotherhood, dragged on but a lingering existence.

With these reflections we regain Llanfihangel and its railway. And thus will I end the reminiscences connected with my first and only night in a church, with the recommendation to those who are curious in such matters, to go and do likewise.

THE MONTH. SCIENCE AND ARTS.

THE Council of the Royal Agricultural Society announce in their Report that their meeting for the present year, which will assume the form and proportions of an International Agricultural Exhibition, is to be held at Kilburn from June 30 to July 7th. The site chosen includes one hundred acres, easily accessible by railway, and not more than two and a half miles from the Marble Arch. Handsome prizes will be offered for sewage-farms and market-gardens, and 'in addition to the exhibition of British and Foreign Implements, Live-stock and Produce, it is proposed to enhance the interest and the instructiveness of the meeting by shewing some of the processes of foreign dairying in actual progress in the inclosure, as well as traction-engines and automatic implements in action.' There will also be an exhibition of ancient and modern farm-implements side by side, which will exemplify the great advance made in agricultural machinery since the Society was formed forty years ago.

Considering that London requires one hundred and twenty thousand gallons of milk every day, it is to be hoped that the promised foreign dairying will excite such a spirit of emulation as shall make dairy-farms more productive and profitable than ever. There will be prizes for the best butter, cheese, bacon, hops, cider; for bees, hives, and honey; and a separate prize for the competitor who shall in the neatest, quickest, and most com-

plete manner drive out the bees from a straw skep, capture and exhibit the queen, and transfer both combs and bees into a hive on the movable-comb principle. And fifty pounds and a gold medal are offered for the best wagon for conveying perishable goods, meat, poultry, fish, and the like, by railway, at a low temperature, a journey of five hundred miles. It is required that the temperature of the interior shall not exceed forty-five degrees Fahr. The Society's prizes are open to all the world, and any one may write to the secretary for particulars.

In a paper read to the Quekett Microscopical Club, Mr J. Hunter states that a fertile queen-bee will in four years lay a million eggs. Twenty-one days are required for the production of a worker-bee; 'but the same egg that produced the worker in twenty-one days could, had the bees been so minded, have been bred up to a queen in sixteen days. The bees,' continues Mr Hunter, 'only rear queens when necessity calls for them, either from loss of their old monarch or apprehended swarming. If I remove the queen from a hive, the first of these contingencies occurs, and after a few hours' commotion, the bees select certain of the worker-eggs, or even young larvae two or three days old. The cell is enlarged to five or six times its ordinary capacity; a superabundance of totally different food is supplied; and the result is that, in five days less than would have been required for a worker, a queen is hatched. The marvel is inexplicable. How a mere change and greater abundance of food and a more roomy lodging, should so transform the internal and external organs of any living creature! The case is without a parallel in all the animal creation. It is not a mere superficial change that has been effected; but one that penetrates far below form and structure, to the very fountain of life itself. It is a transformation alike of function, of structure, and of instinct.'

An important line of demarcation between the vegetable and animal world has been removed by recent investigation. Plants assimilate carbonic acid, give off oxygen, and form starch. By experiments on a species of Planaria, a flat worm, described as *Convoluta Schultzei*, Mr P. Geddes has demonstrated that that animal disengages oxygen in large quantity, decomposes carbonic acid, and produces starch. This worm abounds in the shallow water on the margin of the sea, and on exposure to sunlight pours forth a stream of bubbles containing, as proved by analysis, from forty-five to fifty-five per cent. of oxygen. And, on subjecting a number of Planaria to chemical treatment, a quantity of ordinary vegetable starch was obtained. Pointing out the significance of these facts in the *Proceedings* of the Royal Society, Mr Geddes says: 'As the *Drosera* and *Dionæa* [two species of well-known vegetable Fly-traps], which have attracted so much attention of late years, have received the striking name of Carnivorous Plants, these Planarians may not unfairly be called Vegetating Animals, for the one case is the precise reciprocal of the other. Not only does the *Dionæa* imitate the carnivorous animal, and the *Convoluta* the ordinary green plant, but each tends to lose its own normal character.'

Professor Hughes, whose microphone established his reputation as a scientific experimentalist and discoverer, has brought out an Induction Balance; that is an instrument in which the

weighing or testing is done by induction currents. There are a few cells of a Daniell's battery; primary and secondary coils, from which currents run in opposite directions; and connections with a telephone, or with an electric sonometer. So long as the currents are undisturbed they balance or 'neutralise' one another; but the slightest disturbance or alteration produces a sound in the telephone or sonometer, as the case may be. For instance, a sovereign is placed in the interior of one of the coils; a disturbance is at once indicated. Place another sovereign in the opposite coil, it restores the balance, and the disturbance ceases, provided the second coin be exactly of the same size and weight as the first. But should any difference exist, however slight, it is immediately indicated by a sound; and if shewn on a scale, offers a ready means of detecting 'sweated' or debased coins, with an accuracy never before attained. And the same with all other metals; consequently, metallurgists and chemists will be able to ascertain the exact molecular constitution of a metal, the amount of alloy, and the degree of chemical purity or impurity. That this instrument will render important, and as yet unforeseen, services to science may safely be predicted; for besides what is already stated, it will detect the changes, produced in the substances under examination by magnetism, strain, pressure, or heat. An instrument that can do so much will, we may assume, do more, when the best form shall have been discovered and tested by a variety of practical applications. Professor Hughes' first microphone was a rough and ready putting together of odds and ends, and his new Induction Balance is a similar exemplification of his skill and genius.

The sonometer or audiometer, as some practitioners will call it, promises to be useful to the medical profession, as well as to the physicist. It measures all gradations of sound, and may be employed to test ears as well as electric currents. In an examination for acuteness of hearing, it would prove infallible, would discover the slightest difference in sensitiveness to sound between the two ears, and detect the changes produced by ill-health. Just as we are going to press, we learn that by employing the sonometer the beating of the pulse can be heard.

Among recent inventions, the Writing Telegraph is remarkable for the combination of philosophical principles and ingenious mechanical devices by which its inventor, Mr E. A. Cowper, can excite a pen thirty miles distant, or more, from his hand to write in distinct and legible characters the message which he wishes to communicate. The sending instrument, at the hither end of the line wire, is provided with a coiled band of paper, which uncoils (by mechanism) as the operator writes his message with a vertical pencil. To this pencil are jointed 'contact rods,' which, as their name indicates, play an important part in the reproduction of the message at the farther end, where a glass pen moving up or down, backward or forward, in exact obedience to the hand of the distant sender, records it in ink, also on a revolving band of paper. So sensitive is the mechanism, that differences of handwriting are immediately shewn as different persons manipulate the pencil. In consequence of the continual uncoiling of the paper, new beginners find it difficult to avoid

leaving gaps in their *as*, *os*, and *ms*; but this is soon overcome by practice, and the words as they pass from under the mysteriously moving pen appear clear, bold, and unbroken. The result is so complete, that the instrument is, so to speak, invested with a charm which inspires an onlooker with surprise and admiration. The importance of this invention must be our excuse for thus again referring to it in these columns.

Can teeth be transplanted? If recent accounts of operations by dentists are trustworthy, the answer must be in the affirmative. But the question has been formally discussed at a meeting of the Odontological Society, and from this we learn that it was in *replanting* (which is not the same thing as *transplanting*) that the foreign dentists, whose names had been cited, achieved their success. Among them, a Frenchman, Dr Magitot, has published full particulars of cases in which diseased teeth were taken out, and the root or a portion of periosteum was cut away, and then were replanted in the same socket, where, after a few days or weeks, they became firm and serviceable. Out of sixty-three operations in four years, five were failures; but some of the cures were painful and tedious, owing to local discharge. In technical phraseology, Dr Magitot holds 'the indications for an operation to be the existence of chronic periostitis of the apex of the root, its denudation, and absorption of its surface. . . The resection of this, which plays the part of irritant, is the essential aim of the operation. And the extraction having been performed with due care, if no other lesion be detected save the alteration in the apex of the root, the tooth is to be replaced as soon as this has been excised and smoothed, and the hæmorrhage has ceased.'

From this it will be understood that the pulling of teeth from one human jaw in order to plant them in another is very far from being an accomplished fact. And it is fair to mention that some English dentists practised the replanting of teeth ten years ago; and there is an instance on record of a replanting successfully performed in 1853. For further information, the *Transactions* of the Odontological Society, the *Review of Dental Surgery*, and the *Bulletins et Mémoires de la Société de Chirurgie* may be referred to.

After many years of trials and experiments to convert iron into steel by a short and simple process, the endeavour has been crowned by success. In Cleveland, that north-eastern corner of Yorkshire, where iron ore is as abundant as salt in the sea, excitement prevails, and years of prosperity are anticipated; and it may fairly be assumed that all ironstone districts will be stimulated into activity by this last metallurgical discovery. As is pretty well known, the long-standing difficulty had been to get rid of the phosphorus present in the iron, and many were the ingenious devices put in practice to overcome it. At length Mr Sidney G. Thomas, F.C.S., commenced a series of experiments on the effect of different materials as a lining for the 'converter'—the receptacle in which the molten metal is subjected to the blast. Experience had demonstrated that the usual siliceous lining favoured retention of the phosphorus; but what other could be devised that would resist the intense heat? By perseverance the alternative—a mixture of limestone and silicate of soda—was discovered. This expelled the phosphorus. The

preliminary results, necessarily on a small scale, were confirmed by large experiments made at the Blaenavon Iron Works, in Wales; and now the process has been adopted by one of the leading firms in the Cleveland district, by whom it will be fully developed, and the conversion of 'pig' into good steel, free from phosphorus, will become an everyday operation. Shall we see as a consequence modification and quickening in the manufacture of machinery and ships; and will cheap steel have any effect on the trade of Sheffield and Birmingham?

National water-supply is a great question; and when the Crown Prince recommends it to the consideration of the Prime Minister with a view to a Royal Commission thereupon, we may assume that it will be attended to. Civilisation as developed in our day is not favourable to purity of water; and if some remedy be not applied, the deterioration of rivers will be accelerated with consequences that may be imagined. Of course when the inquiry is once started it will have to comprehend all available sources of water-supply, including those that lie deep underground, as well as those on the surface. Statements concerning the deep-lying reservoirs have already been given in this *Journal*: estimates of the quantity of water they contain, and systematic explorations for additional supplies will have to be made. Judging from past experience important discoveries may be expected to follow. Leamington may be taken as an example. The town is situated on an easterly extension of the saliferous deposits of Shropshire and Worcestershire, and derives thence the saline springs to which it owes its reputation. Until about six years ago the water-supply was drawn from the river Leam. The corporation then sought to substitute spring-water, and bored to a depth of three hundred and forty-six feet, but found so much salt water that the undertaking was abandoned. They consulted Professor Ramsay, Director-general of the Geological Survey, and on his advice began another boring at the foot of a hill a mile distant; and after penetrating mostly through sandstone to a depth of two hundred and two feet, they struck an enormous supply of fresh water (pure spring-water), which now yields two million gallons a day. From this it may be inferred that by a sufficient number of borings in the right places any quantity of water may be obtained. Rugby is an instance of a wrong place, for a boring there more than a thousand feet deep produced brine only. Coventry on the other hand gets a million gallons a day of clear spring-water from four bore-holes, the deepest of which is four hundred and fifteen feet.

Some time ago, Dr Stevenson Macadam pointed out in a communication to the Royal Scottish Society of Arts that the dirty condition of water cisterns in dwelling-houses was highly prejudicial to health, and he gave analyses of the sediments, which consisted of putrescent matters impregnated with lead. The water at the supply-pipe may be pure, but soon becomes impure if not properly cared for in the cistern. 'The remedy for the evil,' says the Doctor, 'lies in the periodic cleansing of the house cistern, which should be regularly done every month or two with a very soft brush, and every care must be taken that the natural skin of the lead be not disturbed. A wire or perforated zinc cover might be placed over the cistern, to keep

out mice, fragments of plaster, and so forth; but a tight cover, which hinders the aeration of the water, should not be used.'

From the official returns of minerals and metals for the year 1877, we learn that the quantity of coal dug out in the twelvemonth was 134,810,763 tons; of iron, 6,608,664 tons; of lead, 61,403 tons; of tin, 9500 tons; of copper, 4486 tons; of silver, extracted from lead, 501,435 ounces; and of gold, nearly all obtained from Merionethshire, one hundred and forty-three ounces. More than fifteen million tons of the coal were consumed in producing the more than six million tons of iron from the ore. The total value of these metals and minerals was £58,398,071. Future years will see a falling off, for the Cornish mines are now so deep that the cost of working is enhanced; and every year greater quantities of copper and tin are brought to this country from Australia and the Straits' Settlements.

As is known to many readers, large masses of iron have been discovered by explorers in different parts of Greenland, and discussions as to their origin have ensued. Were they meteoric or not? The answer arrived at by recent researches is *not*. In the words of the Report above quoted, it is 'now shewn conclusively that the iron masses are all geological productions of the immense lava-field which covers to an enormous (and northwards to an unknown) extent the greater part of Northern Greenland.'

It has often been stated that the railway 'cars' built in the United States are much stronger than the railway 'carriages' of this country. An example occurred in Philadelphia during a tremendous gale, with wind rushing seventy-five miles an hour, in October last. A shed under which trains were drawn up ready for service was blown down. The cast-iron column, ten inches diameter and twenty-five feet long, supporting the iron girders of the roof, fell upon the cars; but the cars were bruised only, not broken. In one instance a column struck a car near the middle, and snapped off; but the framework of the car was not fractured. Most readers will agree with what has been remarked on this fact, that a car that will stand without injury the impact of a ten-inch cast-iron column, with six tons of extra weight, driven by a gale of seventy-five miles an hour, contains an excess of strength very assuring to the traveller.

WANTED, A HAT.

MODERN scientists are fully agreed that the Human Hat is not congenital, and many instances are on record of races totally devoid of any form of it. As a general rule, it may be laid down that a hat of any kind is unknown among barbarous tribes; while it is an indispensable adjunct of civilisation. But there are exceptions to this rule. Captain Cameron has told us that some of the natives of Central Africa cultivate a hirsute head-covering which is either typical or imitative; we have been told that in the Southern Seas some of the aborigines use a head-covering which serves alternatively as the family soup-tureen; and we of our own knowledge are aware that in this country

there are many educational institutions where youth is free to go unencumbered with artificial head-gear. In stating the rule we readily admit these exceptions, and proceed. The hat makes its appearance at a very early stage of existence. In a few weeks after birth, the first incipient growth appears in a soft concave form, enveloping three sides of the head. This develops in the course of years, and according to circumstances, into a somewhat harder and broader form covering only the top; then it extends a margin and stiffens; while ultimately it elongates and assumes a cylindrical form. It is a remarkable fact that in the earlier stages of its history, this latter form, which one may call the full maturity of the Human Hat, did not develop until about the age of twenty-one years; whereas now it makes its appearance occasionally at about the fourteenth or fifteenth year, although more generally at about the seventeenth or eighteenth. In many cases it is simultaneous with admission into church-membership.

That there is a sex in Hats is of course well understood; but here we treat only of the male gear. The female hat is too complex and various to be treated of within the limits of this article, and it is indeed questionable whether any member of the male sex is competent to treat of it at all. It is after passing the second and third stages that the hat begins to work its influence upon man. Then it becomes an inseparable necessity. To remove it forcibly calls up all the worst passions of his nature; while its voluntary removal argues the possession of a certain refinement of soul exhibiting itself in deference to age or beauty, tribute to worth, and in veneration for institutions. And the non-removal voluntarily indicates conversely the rude boorish animal which has assumed the outward signs without the inward grace of civilisation. Again however, we must note an exception. Among the many species of mankind, there is one which is never known voluntarily to remove its head-covering, and yet is devoid neither of grace nor of refinement. It is popularly supposed that Quakers sleep in their hats, but to this calumny we are enabled to give an authoritative denial.

A full-grown man without a hat of some sort is a *lusus nature*. His appearance in conventional garb in a public thoroughfare without this excrescence will produce almost as much sensation as a runaway horse. How inseparable the thing is from our daily thoughts and actions is evident from the multitude of common colloquial expressions referring to it. One phrase—'As mad as a hatter,' has often puzzled inquiring minds; but it is probable that its explanation may be found in the scientific theory with which we set out. If madness is traceable to the malformation of brain-cases, then it is directly traceable to the work of hat-makers.

There is this curious anomaly about the Human Hat, that while it is inseparable from man, who seizes it as one of his most precious inheritances, pressing it closely on to his head when abroad, and clinging tenaciously to it whether in the company of friends or enemies, yet its shape and colour and quality may be changed at pleasure. There are some men whose vanity enables them always to cultivate successive crops of new

glossy bright hats, and others whose vanity enables them always to maintain a supply of very bad old ones. There are some men who are always cultivating new hats, and some who never change their first growth. Some men, again, have the faculty of assimilating the hats of others very readily, and it is noticeable that these persons usually display a fine discrimination. In the abstract, one hat may be as good as another; but in the concrete, a good hat is certainly better than a bad hat. To enter a house or public place with an old hat and to leave it with a good new one, without pecuniary expenditure and without physical exertion, argues the possession of mental grasp and adaptive capacity very admirable from a certain point of view. The inheritors of the old hats may probably be disposed to characterise these traits differently; but their opinions are biased. The Human Hat is a capital index of character, as well as an infallibly professional indicator. Who, for instance, can mistake the Clerical Hat, the Sporting Hat, the Travelling Hat, or the Miller's Hat? So also in the often close assimilation of the female to the male head-gear in shape and material, we have striking evidence of that tendency whose aim is to equalise the sexes. It is idle to speak of the supremacy of man when he is fast losing even the distinction of his own head-gear!

But dearly as a man prizes, and carefully as he cherishes and fondles this precious inheritance, it is fruitful of much mental anguish and much physical discomfort to him. As evidence of the former, we need only remind our fellow-sufferers that the careful thought and diligent research of centuries have not yet determined what is the best method of disposing of a hat in church or in other place of public meeting where space is limited and female skirts abound. Nor has any amelioration been yet afforded to city possessors of the stove-pipe variety in the hot brain-oppressing days of summer, and in the wet gusty days of autumn and winter, when Boreas runs riot along the streets and down the cross-lanes. How many pious thoughts are checked, how many benevolent intentions are frustrated, how much evil language is engendered by these defects in this otherwise admirable human organ, it is beyond our power to calculate. Most people can associate some sin of omission or commission with a hat, and charge it as the very 'head and front of their offending.' It is truly lamentable that such a state of things should continue in these days of scientific research. That we have not yet passed the acme of mechanical invention, the telephone and the phonograph have assured us. There is still possible originality in the walks of science and in the appliances of daily life. What Stephenson or Wheatstone, or Hughes or Edison will now arise to supply a universally felt (or silk) want? That want is a Patent, Universal, Adaptable Hat—suitable for all climates, positions, and circumstances—which will enable man to dispense with umbrellas and physical discomfort, with hat-cases and mental torment—which will be brain-stimulating and not head-crushing—and which will be in all respects a thing of beauty and a joy for ever. For the inventor of a truly perfect Human Hat, there is an enormous fortune in store. The late king of Burmah we were told had devoted himself to cultivating a paper variety; but to this we can

see, in our climate at anyrate, many objections. In Hat-philosophy there is still room for a Teufelsdröck.

ABOUT LOCUSTS.

From a resident in Smyrna we have received the following interesting communication regarding these Eastern pests, the locusts. He thus writes: 'In the month of May 1878 I went by rail to a village situated about five miles from the town of Smyrna. On one part of the line there is an incline, which I noticed we were ascending at an unusually low rate of speed, and the engine was puffing and labouring in a most unaccountable manner. On looking out of the window to ascertain the cause, I perceived that the ground was literally covered with locusts; and scarcely a minute had elapsed ere the train ceased to move, owing to the rails having become wet and slippery from the number of these insects that had been crushed on the line. Sand was thrown on the rails, and brooms were placed in front of the locomotive, by which means the train was again set in motion; and we finally reached our destination in thirty-five instead of fifteen minutes, the usual length of the journey. On entering the village, I called at a friend's house, and found the inmates assembled in the garden, drawn up in battle-array, armed with brooms, branches of trees, and other implements of destruction, waging war against their unwelcome visitors the locusts, which, it appears, had scaled the outer walls of the premises, taking the place by assault, and were committing sad havoc on every green thing to be found in the garden. The united efforts of the household, however, were powerless against their enemies, which were momentarily increasing in number; so they were compelled to beat an ignominious retreat, and seek refuge in the house.

'I now propose to give some account of the nature and habits of these insects, which may possibly not be uninteresting to European readers. Locusts are first seen towards the end of April on the slopes of the hills, where the eggs of the females had been deposited the previous autumn. When born they are about the size of ants, but develop in a wonderfully short time to their full size. Early in May they are sufficiently strong to travel all day on foot, collecting together at night in dense masses. At sunrise they recommence their march—their heads invariably turned to the south—devouring every green herb that comes in their way, grass especially being their favourite food. In the rear of these advancing armies others are following, which subsist on what is left by their more fortunate companions of the advanced guard. Towards the end of May locusts are sufficiently developed to take short flights on the wing, and wherever they alight woe betide the unfortunate owners of the property! In June and July they rise to a considerable height in the air, their infinite numbers occasionally darkening the sun. As at this season of the year there is no more grass in the plains and the corn has been harvested, the vineyards are unmercifully attacked as well as the leaves of trees; and when hard pressed for food, even the bark of trees is not spared by these voracious insects. Locusts die off in August; but before this occurs the females bore holes in the ground on the slopes of the hills, sufficiently large

to insert their bodies; then the males—I am assured by eye-witnesses—cut off their wives' heads; and thus the eggs which are contained in the females' bodies—averaging about seventy in number—are preserved against the inclemencies of the winter season.

'It occasionally happens that locusts disappear for a number of years in succession; it is therefore presumed that in seasons of scarcity they are compelled—before the breeding season—to take long flights in search of food; and when this occurs, millions of their dead are found on the shores of the sea, and the effluvia from their bodies often occasion great sickness. In the year 1832 locusts lay two feet deep in the Bay of Smyrna. Shipping and typhus and other fevers became so prevalent in the town that many families in a position to leave, took refuge in the country villages. With a proper government, this Eastern plague could by degrees be done away with; but the Turks leave everything to Fate; and although occasional orders are given by the governors in the interior for their destruction when they first appear in the spring, only half-measures are taken, and little is gained by these futile attempts to destroy them. In former times, Cyprus was annually devastated by locusts; but of late years this great infliction has almost ceased to be a source of anxiety to its agricultural population, owing to the intelligence of a European who holds property on the island, and who invented the following simple method of destroying them in their infancy, which has been already alluded to in the public journals.

'Locusts, as mentioned before, are born on the slopes of the hills, and when they are sufficiently developed to commence their work of destruction, descend into the plains in long and regular columns, never deviating from their path. Anticipating this method of progression, trenches are dug at the base of these hills; and when the locusts are within a few yards of the pits, they are inclosed between two long strips of canvas placed perpendicularly in parallel lines leading to the mouths of the pits. A piece of oil-cloth is then spread on the ground, extending a few inches over these trenches in a slanting position, over which the locusts continue to advance, and are precipitated into these traps in innumerable quantities, and immediately destroyed. If the Turkish government followed the example set them by the inhabitants of Cyprus, Asia Minor would soon be free of locusts; but as there is little chance of this being the case, we must expect a yearly increase of these insects, and trust to natural causes for their destruction.'

LITERARY WORK.

WITHIN the memory of middle-aged persons, literature has become more significantly an independent profession than it ever was before. In the early part of last century, as is well known from many facetious traditions, an author was ordinarily a poor creature who required a titled patron to countenance his production, and bespeak for it public favour. Hence the grovelling adulatory dedications to noblemen which we see in old books. That sycophantic period had its day. Then came the time when writers looked only to publishers possessing sufficient enterprise and judgment to purchase and bring their works into notice. There is no end of anecdotes about the alleged overbearing arrogance of these tradesmen, and their cruel dealings towards authors. A sad time it was, no doubt, when men such as Goldsmith went about asking publishers to give them a few pounds for a poem, a prose fiction, or some other product of their genius which they timidly offered for inspection.

Sad as such a picture of humiliation was, we in justice ought not to hurry to the conclusion that long ago publishers were a set of heartless scoundrels, who made a point of plundering authors of their wares. It is to be recollected that in these past times there was a comparatively limited reading or book-buying public. Few of the operative classes could read or write. Female domestics, sempstresses, and farmers' wives were quite as ignorant. Hardly any among what we call the middle classes bought books. Many country-towns had no bookseller at all. Only at fairs and markets was anything in the shape of paper and print offered for sale, and generally of a very humble kind. A taste for literature of a superior order, honoured with the imprints of London booksellers, was confined mainly to the wealthy in large cities, and to members of the learned professions. In some country mansions of the landed gentry there was not a single volume in general literature, and newspapers were almost as rare. With so poor a prospect of customers, the

publishers required to be cautious in their dealings with writers, however estimable might be their productions. Although placed in the front rank of authors by his poem of 'The Traveller,' Goldsmith was fain to sell the copyright of his 'Vicar of Wakefield' for five-and-twenty pounds. By no words could we more emphatically refer to the mean reward still given for literary exertion a hundred years ago, than that so insignificant a sum should have been paid for this matchless fiction.

Matters were not greatly mended in the early years of the present century. A crowd of novelists had grown up to supply materials for circulating libraries, and the price they got for their productions was usually thirty pounds for three volumes; which, considering the quality, were dear at the money. Miss Edgeworth gained higher rewards, still nothing to speak of. The 'Edinburgh' and 'Quarterly' Reviews were now beginning to stimulate the public taste for literature. Though the war with France, which was felt to be a kind of death-struggle with Bonaparte, was obstructive of social advancement, it did some good, by creating a thirst for intelligence through the newspapers. Reading was greatly on the increase when Scott and Byron burst on the world like unforeseen meteors. The earlier poems of Scott created quite a furor. When it was known that two thousand guineas had been paid for the 'Lady of the Lake,' it was received as a fact in authorcraft which at that time had never been paralleled. Notwithstanding this success, Constable was doubtful if Scott would shine as a novelist, and offered him only seven hundred pounds for 'Waverley,' which was refused. It was a mistake keenly regretted, for 'Waverley' very shortly ran through eight editions, and was rapidly followed by other works, which were received with an equal amount of favour. 'There were giants in those days!' We have seen nothing like them since.

The most remarkable feature in modern literary work is the rise of periodicals appealing to large numbers of readers. The old five-shilling reviews—great in their day—are almost left in the condi-

tion of a vessel stranded for want of tide. There are now weekly and monthly periodicals of a cheap class which give employment to thousands of skilled writers, and which, in point of circulation, leave the old respectabilities immeasurably behind. In the Victorian era, we may be said to have got into a new literary world. The dull solemnities and political partisanship of the Georgian era will no longer do. There has grown up a hatred of shams, and of views perverted by political prejudice. Along with the sparkle of humour, readers desire to have something like impartiality and common-sense, no matter what may be the subject under treatment.

The revolution has been brought about by a demand for light reading consequent on social development. It may be admitted that this demand is not in all respects wholesome. Many writers of fiction seem to draw on the wildest fancies, and their productions are pretty much on a par with the old Minerva class of novels, the remuneration for which was rated at ten pounds a volume. But besides these, there are writers of a higher stamp who devote themselves to the composition of fiction on quite a comprehensive scale. They sell the product of their brain three or four times over. Their novel first appears in a weekly or monthly periodical, and according to reputation, will be paid by an honorarium varying from a hundred to a thousand pounds. While so running its course from month to month over half a year, advance proofs are transmitted by the writer to a publisher in the United States or Australia, perhaps both, and there, in these distant lands, the novel is appearing in a periodical at the same time it is going on in England. Having done its work in the periodicals all over the globe, it is issued in London as a three-volume novel, at a guinea and a half, in which shape it flourishes in all the circulating libraries. The next form it assumes is probably that of a volume bound in cloth at five shillings, which suits a certain class of customers. The life is not out of it yet. It is reprinted in a volume in small type, with a blazing yellow paper cover, at the modest price of a shilling. This is the form in which it appears on the railway book-stalls; after which usually no more can be made of it.

For these manifold successes the novelist has to thank the prodigious number and variety of readers. In every form in which the fiction appears it suits a particular class, and to every class in turn it seems new and attractive. In our days therefore authorcraft has a scope far beyond what was known or imagined in former times. The rewards of literature are increasing in proportion as people are taught to read, and as in the progress of affairs the taste for literary recreation is extended. Walter Scott used to say that literature was a good cane to walk with, but not a staff to lean upon. Since his time, literature has become a staff of a very effectual kind. It has risen from amateurship to a recognised and honoured profession.

London is of course the centre of literary work in England, because the metropolis offers every appliance—the library of the British Museum ready at all times to aid the literary man in his researches, publishers who have business relations with all parts of the world, printers with every appliance in typography, wholesale sta-

tioners who have ever on hand huge stocks of paper, artists to promptly furnish every kind of illustration, newspapers and critical journals to record novelties, and added to all a literary society in which the author and authoress find an agreeable fellowship. For some kinds of literary work, Oxford and Cambridge possess peculiar advantages. Edinburgh is less favourably situated; yet with the aids generously offered by the Advocates' Library, it maintains a brave struggle, while as respects certain departments in printing and forwarding it has an advantage over London in the article of cheaper labour. Where large impressions have to be produced, this is a matter of first concern. With this in its favour, the cost of transmitting masses of paper and print to branch houses in London is comparatively insignificant. Edinburgh, however, labours under the drawback of having for the most part to procure supplies of the lighter kinds of writing from the metropolis. In these days of cheap and rapid postage, this is got over to some extent; but there still remains the discouraging local and national deficiency, arising not only from the superior attractions of London, but from the constant misexpenditure of excellent brain in Scotland on the dreary muddle of sectarianism.

Wherever produced, English literature is now a large matter of export to every English-speaking country except the United States, in which there are heavy import duties, and no protection from invasion of copyright. A few novelists and other writers are able to secure a definite payment for advance-sheets; but the great bulk of English literature is exposed to unlicensed appropriation in the States. In other words, there is no law in that country to prevent a publisher from reprinting any new book from England he can lay his hands on. This is an exceedingly convenient process of rearing a business on the brains of British writers. While a London publisher is paying probably a thousand pounds for the copyright of a book, the American publisher has the pleasure of getting the book for nothing. Carried on from year to year on a wholesale plan, this species of appropriation has led to the natural result of discouraging the growth of American authorship, which for a great nation is not a creditable state of things.

The truth appears to be that, as regards literature, the United States are under the thralldom of a few large publishing concerns in New York, Boston, and Philadelphia. They contrive to get so heavy an import duty imposed on English books as to keep them out of the country. They then proceed to execute reprints from copies procured by mail, and so keep the market to themselves. It is a beautiful instance of trade protection, which inflicts a wrong on a whole nation to serve the purposes of a few selfish individuals. Hitherto there has been an understanding among these monopolists, that any one of them who was the first to issue an English book should not be competed against by others. By priority, he acquired a special privilege known as the 'courtesy of the trade.' When some unscrupulous individual attempted to issue a rival edition, he was immediately run down by the publication of a cheaper edition, and thus the monopoly was sustained.

The proper cure for all this is, of course,

an international law, by which English writers would secure copyright in America, and American writers secure copyright in England. But to every proposal of this kind the Americans, under the influence of the confederated publishers of New York and other places, have steadily objected. According to recent accounts, leading members of this unscrupulous body have been brought to a consciousness that some kind of international copyright is desirable. The cause of their conversion to a sense of propriety is amusing. In late years, publishers have sprung up in Chicago, who look with contempt on the 'courtesy of the trade,' and possess the tact as well as the means to baffle it. When a New York publisher brings out an edition of an English novel at a dollar, the Chicago tradesman issues an edition of the same work at ten cents or fivepence, which at once reduces the monopolist to despair. As regards that particular book he may as well shut up shop. It is a case of diamond cut diamond, out of which possibly good may come.

Circumvented, humiliated, the confederated monopolists have taken up new ground. They will be content to give British authors copyright for their works in America, provided the works are issued by American publishers. The meaning of this is, that a limited number of firms may still have the privilege of keeping everything to themselves; for that would be the result under any such arrangement. If not devoid of decency and honesty, they will frankly unite in promoting a system of international copyright, by which all on both sides of the Atlantic would start fair, and allow freedom of trade in literature to take its course. Surely there are large numbers of people in the United States who must be not a little ashamed of the shabby shifts of a few publishers in New York, Boston, and Philadelphia, to live by the systematic reprinting of English copyrights, and who on reflection would endeavour to put an end to a state of things so exceedingly disreputable. Meanwhile, we are rather glad that Chicago interlopers have had the audacity to break up the monopoly of the few firms which have so long domineered over the general interests of literature. The result can scarcely fail to be beneficial.

W. C.

YOUNG LORD PENRITH.

CHAPTER XXX.—UNDER A CLOUD.

LADY LARPENT, after the visit of the Black Miller of Pen Mawth, was in anything but an enviable frame of mind. The Dowager was, as women go, a thoroughly good woman. There might be a little worldly rust about her heart, but the heart itself was of sterling gold. In truth, her weak point, as often happens with us, was precisely what she deemed her strongest coin of vantage, her shrewd, cool, prudent head. She had the pride of intellect far more than the coarser pride of rank or money. If she detected a knavish servant, or struck out a wrongful item in a tradesman's bill, she was vainer of her victory than of the fact that her wealth and rank and strength of will made her a personage and a power in the land. Now she was wounded, galled, stung, and that precisely where the smart was sharpest, in that her knowledge of the world had to all appearance been grossly at fault.

She had thought so well of Hugh Ashton!

Other protégés she had, in common parlance, taken up, merely to find them fall short of her estimate, or break in her hands. But this noble young fellow had borne himself hitherto with a gallantry and a discretion that did credit to her choice. Secretly, she had sighed more than once as she contrasted her own coxcomb of a son, callous, flippant, dead to generous impulse, and this brave young Hugh. Had she but had such a son as Hugh Ashton— But that being impossible, she had cherished vague projects of future promotion for the fisherman of Bala Lake; and all the bitterer was the disenchantment that followed. Nobody likes to have wasted kindness on an unworthy object, and Lady Larpent the least of all. And that Hugh was unworthy, the Dowager very much feared. She had taken him on trust. Of his past life she knew, save from his own lips, nothing at all. And how if his own account of his past life had been untrue; how, if he had left out something, the mention of which would have condemned him!

That the Black Miller was an enemy of Hugh's she never for an instant doubted. But then, enmity is not necessarily co-existent with calumny. But for private hate, for private resentment, the law would most rarely be invoked to redress wrongs or to punish the wrong-doer. Justice awaits, in passive attitude and with bandaged eyes, the moment when the cry of human suffering shall cause her to make use of sword or scales. And Ralph Swart had done his work well. Lady Larpent hardly knew how much her crafty visitor had contrived to suggest, and how little he had managed to affirm. He had said, roundly, that he intended Hugh to be his own accuser. He had laid down, as if unconsciously, the lines on which the Dowager might act. There was to be no formal charge, but merely a query or two; and the Black Miller had shewn a grim confidence as to the result, which, although unwelcome, was contagious. Under the influence of these newly formed suspicions, the lady of Llosthuel had written to Hugh requesting his prompt attendance at Llosthuel Court.

The missive sealed and despatched, Lady Larpent awaited, with a nervous impatience that surprised herself, the coming of him whom she had summoned to receive, it well might be, his sentence of dismissal and disgrace. For a time she remained in her study, making an elaborate pretence of being extremely busy; but the figures in her columns of accounts swam and danced before her eyes, and the letters she perused joined in one monotonous chorus of 'Hugh Ashton—guilty—guilty—guilty!' Then she locked up her letters, and went back to the drawing-room, and was absent, moody, and snappish in her talk with her niece, until Maud marvelled what had befallen her kind, shrewd aunt, to change her thus.

'Captain Ashton—in the study, please, my Lady,' murmured obsequious Parker; and to the study Lady Larpent once more repaired. Hugh wondered that his patroness answered his salutation by so cold a bow.

'Please to sit down, Captain Ashton,' said the Dowager stiffly, as she took, with a more judicial air than usual, her own seat in her high-backed chair. 'I have sent for you—on a painful errand this time, Captain Ashton.'

'Indeed, Lady Larpent?' returned Hugh, turn-

ing his frank eyes towards his kind old friend, whose changed manner puzzled him.

'Yes; I have heard—no matter what—suffice it,' continued the Dowager, 'that it seems as though you had not told me, Mr Ashton, all that I had a right to know.'

Hugh started and reddened. Start and flush were very slight, but quite sufficient to be marked by a keen observer on the look-out for such signs, and ready to draw deductions from them.

'I do not quite, Lady Larpent, apprehend your meaning,' he said.

'I will put the case more clearly,' resumed the Dowager, with a look of annoyance. 'I do not think you have been as explicit with me as—as—perhaps you might have been. Are you sure, for instance, that your right name is Ashton?'

Again Hugh winced perceptibly. 'I bear the name as my father bore it,' he replied with some awkwardness.

'Of that I am aware,' rejoined the Dowager coldly. 'You have led a wandering life, Mr Ashton, and it signifies little, no doubt, as to a mere name. There is a more important topic on which I must speak. Of my own regard for you, and—the high opinion we have all had of you, and the debt of gratitude due to the preserver of my niece's life, I need not speak. I have done my best to be your friend, have I not?'

'Indeed, Lady Larpent, you have,' answered Hugh; and his handsome young face looked so honest and true as he spoke the words, that it was almost with a sob, which she turned into a cough, that Lady Larpent resumed: 'The more shame for you, Hugh Ashton, then, if, as I fear is the case, you have deceived me!'

'Deceived you, Lady Larpent!' cried Hugh, starting to his feet.

'Deceived us all, I may say,' continued the Dowager, who, the ice once broken, went on with all of a woman's outspoken vehemence of complaint, 'since we have all had an opinion of you which—which I hope may have been deserved. I believed what you told me, the very little that you told me, of your past years, as sailor and colonist, and was content to take you and your father for plain, honest boatmen, with education and manners, I admit, superior to your station. Since then, it has come to my ears—'

The Dowager hesitated here; and Hugh Ashton asked, half sternly: 'I have not yet learned what it is which has reached your Ladyship's ears concerning me.'

'That you have not been open with us, and candid, and sincere, Captain Ashton,' answered Lady Larpent, eyeing Hugh as though she hoped to search his heart with the intensity of her gaze; 'that you have exercised a reticence—perhaps a prudent one—as to secrets which—'

'Secrets!' Hugh could not help repeating the word, although he did it with a quivering lip and a troubled mien, which added fuel to the fire of the Dowager's very natural suspicions.

'Secrets,' said the Dowager, knitting her imperious brows, 'are never desirable, of course; but they need not imply sin or shame. You best know, young man, if that which you have hitherto kept is innocent or not.'

'Spare me this!' muttered Hugh huskily, as he shaded his eyes with his open hand and turned his face away.

'I have been most friendly towards you, Mr Ashton, in thought, and word, and deed,' pursued the Dowager. 'It is, then, as a friend that I ask of you, has nothing, nothing of serious import been kept back? Are you, in fact, what you seem to be?'

'You have been well informed, I fear, Lady Larpent; by what means I cannot guess—too well informed,' answered Hugh in a broken voice.

In the Dowager's ears this was tantamount to a confession of guilt. And yet it was pity of him too, she felt, this hidden sin, done years ago, it might be, coming home, like a halting Nemesis, to this gallant youth, who had seemed the very soul of unselfish courage and stainless faith. What had he done? It was difficult to connect the idea of Hugh Ashton with any mean crime, such as peoples our jails, with forgery or theft for instance. But a bushranger's career of desperate adventure might have had temptations for so daring a spirit, or there might be blood on that hand—the hand that had saved Maud's life!

'If you could explain'—began Lady Larpent, with weighty patience; but Hugh interrupted her.

'I cannot!' he said, with a groan. 'I would give the best years of my life, if— But that is useless now. I had hoped, in an obscure situation and lonely place, that the past might be buried. It seems,' he added bitterly, 'that I was wrong, and that the finger of shame may be pointed at me even here.'

'Then, Captain Ashton,' said the Dowager, with a touch of magisterial severity, 'is it not for yourself to decide whether you will risk exposure to—to unpleasantness, by remaining any longer in Treport? I cannot—that is to say, the Board cannot, deprive you of your post as Captain of our steamer on mere suspicion, certainly. But if you stay, and challenge proof of what you scarcely affect to deny, the whole story will become public, and you could scarcely avoid resigning your appointment, even if—'

'You are right, Lady Larpent. Yes; I feel I ought to go,' returned the young man, hiding his face and letting his head droop sadly upon his breast. 'What I regret the most is the loss—so it seems—of your good opinion.' The dejection of his attitude, the muffled sound of his low voice, moved the Dowager to pity while confirming her suspicions.

'I would have given much, Hugh Ashton, to have heard you justify'—she said falteringly.

'The task, though I would lay down my life for it, is beyond me,' said the young man gloomily. 'I can but go, and that, Lady Larpent, I will do at once. May I hope that you will be silent as to what you have heard?'

'Certainly I will, if you consent to quit Treport without delay,' replied the Dowager. 'Nor do I forget your services to the family, or your good conduct here. Money may enable you to go abroad, and efface, by time and distance, the memory of the past. If a cheque for four hundred pounds, or five—'

'I thank you, Lady Larpent; but I need for nothing,' answered Hugh, drawing himself up to his full height, and speaking with a quiet dignity that became him well. 'The day may come, perhaps, when you may regret the severe judgment which you have formed of me.' He said no more,

but, with a slight inclination of the head, turned and left the room and the house. The last glance of the young sailor's sad, proud eyes haunted the Dowager's memory for many a day afterwards.

CHAPTER XXXI.—FAREWELL, MAUD.

It was a bright and beautiful morning which dawned upon the west of England, on the day following that on which Hugh Ashton had saved the bird-hunter's life, and had his own unsatisfactory interview with Lady Larpent. He was not one to loiter or to lose time when once his mind was made up, and already his few and simple preparations for departure had been effected. He had written to the Secretary of the Board, his employers, giving in the resignation of his command. The keys of the lockers in his cabin on board the steamer, with the telescope and some other objects belonging to the Tug and Salvage Company, he had intrusted to old Captain Trawl's care on behalf of their lawful owners. His own boxes were packed, and were to remain under the charge of his late kind host, until he should write to indicate the address to which they were to be forwarded.

A harder task than these merely mechanical duties Hugh Ashton found to be that of bidding farewell to his good friends beneath whose roof he dwelt, and without explaining the cause of his abrupt departure. That the young Captain of the *Western Maid* should suddenly throw up his appointment, quit the town in which he had come to be regarded with liking and respect, and renounce the occupation in which he had already won high credit with all, seemed utterly unaccountable. That Lady Larpent was somehow connected with Hugh's apparently capricious change of plans, was easily to be conjectured; but what could be the reasons that could have induced the imperious Lady Paramount of Llosthuel to desire the absence of one who had so lately been a prime favourite, and whose conduct since his promotion had surely been such as to content the most exacting patroness that ever lived! The thing was inexplicable.

Hugh, who alone possessed the key to the enigma, shook his head sadly when the old Captain and his grand-daughter questioned him on the subject of his abrupt change of plans. 'Do not ask me, dear friends, why I must leave you. Some day, perhaps—— But now I can merely tell you that go I must, and that the *Western Maid* will never know my tread upon her deck again.' He avoided all unnecessary leave-takings. 'Wish Long Michael, and the crew, and the good fisher-folk, good-bye for me; and give them my best wishes,' he said to Will and Rose and the aged Captain; 'I shall not go among them again for a last hand-shake, but would rather get quietly out of Treport.'

Hugh had decided wisely when he determined not to bid his outspoken acquaintances on Treport quay and its vicinity a personal adieu. It was of course impossible to take a crowd into his confidence, and there would have been remonstrance, and regret, and cheering; for no stranger in the little coast town had ever become in so short a space of time one-half so popular as Hugh Ashton had done. As it was, he said farewell, sorrowfully enough, to his friends at the cottage door, and set

off on foot, with stick and bundle, like any poor sailor going to seek employment in some distant port. At the garden gate he turned for a last look at the group that remained, sadly watching him beside the door. There was the gray-haired old Captain, leaning on a staff, and by no means the sturdy figure to look upon that he had been a few short months ago; there was pretty Rose, with her affianced husband by her side; and there was the dwarfish form of Nezer, holding back the dog, which struggled boisterously in its efforts to follow Hugh. The young man waved his hat to them in token of farewell, and then was lost to sight.

Hugh had come into Treport, when first nominated to the command of the steamer, cheerily enough, and with fair prospects opening out before him. He was leaving the place now, sorrowful and weary-hearted, but steadfast as a sleuth-hound to the purpose to the fulfilment of which he had devoted his young life. Many thoughts passed through his busy brain as he climbed the steep hill-side, choosing unfrequented paths and by-lanes, where he was not likely to meet any who knew him. It would have been painful to him to have to stop and converse now with one who had made his acquaintance during his brief season of prosperity, and could not now perhaps refrain from expressions of curiosity or condolence. Once, from a turn in the road, he looked down upon the sea-side portion of the town, where the gabled houses clustered thickly together, where the nets were hung to dry from masts protruding from the windows, and where, in the quay-pool itself, in the midst of sails of many colours—orange, tawny, and red—lay the *Western Maid*, taut and trim. He shook his head sadly, and walked resolutely on.

Threading his way by devious tracks and those sinuous lanes which in country places often appear to have sprung spontaneously into existence, so trifling appears to be their utility to the common-weal, Hugh at length drew near to Llosthuel. The Court, as has been said, stands nobly forward on a swell of rising ground, and commands a pretty prospect of Treport nestling below, and a grand one of cliff and headland, and the measureless Atlantic flashing far away. But the grounds are less notable than the house. Many a Kent or Sussex squire with only three or four poor annual thousands to form his rent-roll, has a far more spacious and stately demesne to girdle in his red-brick Hall than had my Lady Larpent of Llosthuel, who was so rich. The fact is that Cornish gentlemen of fair estate, like French viscounts or Belgian barons, were in bygone times less desirous of privacy than were those of the squirearchy who dwelt east of the Tamar, and thus there was a tract of uninclosed common land which came very near to Llosthuel Court.

Hugh Ashton knew the place well. It was a spot where the wild rocks, with golden gorse and yellow broom rooting themselves in every cleft and crevice, came close up to the tall paling that shut in the well-kept rose-garden of the Court. No contrast could have been greater than that of the barren tract outside that charmed barrier—with its scarce grass and brown heather, the bushes, the bare stones, and a few black pine-trees bent and distorted by years of hopeless contest with the mighty sea-wind—and the trim parterres and velvet

lawns and wealth of colour within. But, bare, bleak, and uninviting as the ragged patch of rocky common land might be, it afforded to Hugh Ashton the opportunity which he sought, to gaze from afar, unseen, at Maud's windows, and to bid her an unspoken farewell. With a lover's ingenuity, he had found out, in the course of his occasional visits to the Court, which were the apartments that the Dowager had assigned to her beautiful niece. Those curtains of white and pink belonged probably to Maud's own chamber; the blue silken ones beyond, to the morning-room attached to it. Might it not be possible that if he did but watch long enough, he might catch a glimpse of Maud herself at a window! He smiled sadly enough at the boyish dream. No; he should not see her then; should see her, perhaps, never more. Never more! To a lover, that means much; means the loss of life's choicest zest and savour, a dull grayness in the pellucid atmosphere and the sparkling sky, an uneasy sense that there is something out of tune in the grand harmonies of the universe. And it was probable enough that Hugh and Maud, the one so high in station, and beauty, and prospective wealth, the other destined to earn a livelihood by dint of sheer hard work, would never meet again. Would she quite forget him? he wondered. And did she care for him, even a little, even as a friend of humble degree? for, mindful of the difference of position, he had never breathed to her a word that could reveal his love.

And yet how he loved her! how warmly and how truly, and yet with a knightly devotion and tenderness such as we are apt to consider as having died out with the death of the best era of semi-mythic chivalry. Had Hugh but lived six centuries before, he would have worn Maud's colours, and broken lances in tournament and battle-field for the fame of her beauty, and perhaps touched her heart, at last, by the renown of gallant deeds of derring-do performed for her dear sake. As it was, he was leaving Treport—he knew it—under a cloud of most undeserved disgrace. He had innocently forfeited Lady Larpent's good opinion; and he shrunk from the thought that Miss Stanhope, like the rest of the world, might put some uncharitable construction upon his abrupt exit from Treport.

'Farewell, Maud—farewell!' he murmured, as his gaze lingered long upon the windows of the rooms she occupied at Llosthuel. 'I go, perforce in silence, burying in my breast the love I have not dared to tell. Shall I—can I—ever hope to win her—ever hope that Maud will be my wife? It seems the mere madness of presumption even to dream of such a future of bliss. What am I in her eyes? Merely, no doubt, a poor fisherman, who once had the luck to render her a service, and was rewarded for it by a promotion that turned out to be short-lived. And yet I have rights—could I but venture to claim them—and a word from me would— But the word must remain unspoken!'

Very sad, to judge by the almost despairing expression of his handsome young face, were the thoughts that now traversed the brain of Hugh Ashton. Twice he turned, as though to leave the place, and twice he checked himself, and again fixed his eyes upon the house that held the beautiful girl whom he felt to be so hopelessly out

of his reach. 'Never, never!' he muttered at length. 'The Dowager herself, so kind before, was quite changed when that accursed rumour, whence I know not, came to her ears. I could see that she looked on me as a sort of outlaw—outlawed for no fault of his own, it is true, but none the less to be hounded and hunted out of the place. So dreadful and so tenacious is the stain of imputed guilt! And he, so noble and pure and gentle, lived and died, without right being done, hidden from the face of day; and I alone, perhaps, of all the world, believe in the cruel wrong that he endured so meekly.'

Hugh was silent for a space, and then, with a last lingering look at the windows of the two pretty rooms, he murmured once more: 'Farewell, Maud, farewell!' and tore himself away. Ten minutes of hard walking brought him to a turnpike road, down which he turned almost mechanically, as if he cared not whither he went, now that Treport was left behind him. 'Farewell, sweet Maud—my love, my love—of that, at least, they cannot rob me,' he said bitterly, as he looked back and caught one more distant view of Llosthuel, and then in silence pursued his way.

HAPPY LAND.

ON the coast of Suffolk, and not far from Ipswich, there is a certain sea-side place called Felixstow, which as yet is little known to tourists. There we have spent such delightful days that we have christened it Happy Land; and in gratitude for the enjoyment, we are glad to let others know of a spot where they can escape from fashion, brass-bands, migger min-trels, barrel-organs, and rapacious landladies.

Come therefore reader, and join us in Happy Land. Bundle up a few things, not fashionable: take your ticket for Ipswich, and drive thence to Felixstow; and when you arrive at the dear little spot, engage one of its pretty cottages, and prepare for a week or two of pure unsophisticated enjoyment. Our neighbours to the right and left in the row in which our cottage is situated, are old farm-servants who have got on, saved a bit of money, and can now afford to live in a seven-roomed cottage, with pretty gardens railed from the road and each other by a low wooden fence. In front of us is a barley-field, with houses, about four or five, dotted here and there at the further end. We are on the cliff, down which we shall ask you to come presently. The view beyond the barley-field from the window of our cottage parlour gives only a thin line of sea, on which a steamer, ships, or fishing-boats are passing.

How delighted are we when we find ourselves taking a cup of five o'clock tea in such surroundings! How luxurious the flowers! Was there ever such barley! And then the sea; and better still, the glorious energy-giving breeze! We are impatient now to be off and away on the beach. We have not far to go. A hundred yards takes us to the end of our road, which is struggling into life. It will be a street some day. Now there are blocks of small houses only at intervals, with gaps between; and opposite, the barley-field holds its own. But we feel the day is coming when half our happiness will be removed away, and the golden barley will have given place to bricks and

mortar for ever. Still we must not meet troubles in this way. At the corner, we come upon the one provision-shop in the place. What an *olla podrida* it is! Post-office, baker, grocer, shoemaker, buttermilk, toy-shop, druggist, all in one. It is here we run the butcher from the nearest village fails us, for something to make good his forgetfulness and to feed our ravenous appetites. We won't say anything about his prices. Naturally a man expects to be paid handsomely if he sets up a shop on a cliff, and finds himself without a competitor for the custom of a place whose inhabitants, judging from ourselves, are always hungry.

But now we are at the edge of the cliff. What air! We stop to inhale and admire. Along the top there is a pathway, and seats for those who are not inclined to descend, where the breezes can bless them all day long while they lounge with book and pencil. There is a wide spread of beach beneath their feet, but it is disfigured for a good way by breakwaters at regular distances. The sea has encroached so much of late years, that these have been found indispensable to prevent it damaging the shore, and even washing away the buildings. As an instance of this, a local informant tells of a 'famous castle that once stood on the edge of one of the cliffs as being wholly lost, and the ground on which it stood is now far out at sea.'

But these breakwaters do not extend all the length of the beach, and where they do, are much appreciated by the youngsters, who play gymnastics over them; to say nothing of the older children, who find them comfortable resting-posts when lounging on the shingle. Beyond them, on each side, there is a good stretch of shingly and sandy beach, where we can walk for miles, and find the way pleasantly beguiled. For are we not looking out for things we never met with before until we came to Happy Land, which is full of interest for the curiosity-hunter? Here we come upon a beautiful bit of carnelian; there, a shark's tooth (an antediluvian shark, be it remembered). Then again a wonderful impression left in stone of some dead-and-gone animal. All that loose shingle we see, now that we know these treasures are to be found for the seeking, how interesting it all becomes! Hour after hour we sit grovelling among the stones if perchance among them we can be lucky enough to find a fossil; and then what a shout of delight when one is discovered! We think of Hugh Miller, and wish we had his books at hand, that we might search in them, and find out all about the specimen, which we shew as a trophy of our perseverance and our ignorance! 'Antediluvian' we cry indefinitely, and are satisfied.

But we don't find carnelians only; amber and jet are to be picked up by the diligent searcher. We saw one splendid bit of amber measuring nine inches in length by four broad and three in depth, which had been picked up on this beach, and purchased by a resident friend of the lucky finder; for this was a very 'lucky find,' by no means common, the amber and jet found here being in small quantities, as a rule.

But what are these 'finds' to the treasures of antiquity that lie buried in the cliff, or crag as it is called here, filled full of prehistoric remains? If you take a knife and cut a piece of

the soft sandy rock, you find that it is composed of nothing but pulverised shells—shells that Shem, Ham, or Japheth might have picked up had they been wandering here as little boys before the Flood. Now and again we come upon perfect shells, preserved throughout the ages in their bed of sand, and carefully we handle them. They are yellowed by time, and venerable even to brittleness. Some are scallops, others whelks, whose spires turn the reverse way to their brethren of the present day! We also find some exquisite minute shells, that we manage to pick out whole from the debris.

But the things that are most novel to us are the coprolites. Imagine polished-looking black pebbles of all sizes and shapes, varying in form from a smooth round black bean to a large turkey's egg, some long, some short, some round; in fact they must be seen to be realised. A slight thing will break them, and the substance looks as if it could be reduced easily to powder. Our local informant declares 'that no one has satisfactorily accounted for their origin, but it is supposed to have something to do with antediluvian animals.' Science has discovered a means of reducing it to a manure which is used for agricultural purposes.

Anxious to discover some of these old-fashioned things, we started off one afternoon to some coprolite pits near; for pits have been dug inland to keep the scattered fragments together which the pickers are employed to collect. Here we found a mound of these pebbles, of all kinds and sizes. Among them we came upon a petrified crab; and we have seen, though we were not fortunate enough to find, a *whale's ear*, also in a state of petrification, that was found here. Some fossilised bone, one crab, five sharks' teeth, and some coprolites, consoled us instead, and we returned well satisfied with our plunder.

The sea-bathing here deserves especial mention. The machines are the best ever built, and the attendance excellent. The water is buoyant; but unless a swimmer, we do not recommend any one leaving hold of the long ropes attached to the machines, by which the most timid bather is given confidence and can defy the rudest waves. A boat is always on the beach in case of accidents, but no instance is on record of any one having been drowned.

Happy Land is one of the few places still left to us where ladies go ungloved, and forget that they ever looked into *Le Follet*; where sober men of banks and business do not scorn to be seen on the back of a donkey; where a gallant but choleric officer is not ashamed to be seen at his garden gate looking out impatiently for the milkman who is keeping him waiting for his breakfast. In fact, this 'waiting for the milkman,' jug in hand, is a morning rendezvous, and ends in a gossip about various matters of local interest with our neighbours to the right and left.

The drives about are as pleasant as indifferent roads can make them. Being in Suffolk, of course we drove to Ipswich to see the Museum (one of the best of its kind in all these counties), and to lunch at the *White Horse* of Pickwickian notoriety. We were shewn up into No. 27 bedroom, where Mr Pickwick was supposed to have strayed in, and to his confusion found when too late that it belonged to another, and

that other a lady. There are the identical curtains out of which he popped his venerable head to see a lady at her toilet. All hail, imagination that could so convert illusions into realities! After luncheon we sallied forth in search of Angel Lane, at the bottom of which was the celebrated passage in which 'Sam Weller' saw 'Job Trotter emerge from a green gate'—the same green gate by which Mr Pickwick was taken to answer for his conduct before the Ipswich magistrate. We had some trouble in finding it; and to facilitate matters asked an elderly female standing at her house-door if she knew which was Mr Pickwick's gate.

'Mr 'oo, did ye say? Peck'—

'Pickwick,' we reiterated.

'Na. I've lived 'ere naigh upon twanty year, and I niver hard of Mr Peekweek.'

'Not Dickens's Pickwick?' we asked.

'Ay; I knaws Dickens, and read about 'in when I had my sight; but I don't know no Mr Peekweek.'

So we left her, regretting she had missed one great pleasure in her life.

We made some valuable acquaintances among the humbler but well-to-do folk, and found them the best of company. We shall not soon forget one drive we took, when our Jehu—an old man of seventy-two—volunteered to act as cicerone. Of course we wanted to know who lived in every well-looking house we passed, and his descriptions were unique. The School-board is busy here, and their bright red buildings are plentifully scattered about in different villages.

'Well, Jehu,' we asked, 'and what is the effect of all this learning? Is it making the people better or worse?'

'Warse!' he grunted. 'I niver had no larnin', nor my old 'ooman, nor niver wanted it. I *warked* [worked]; and they be all lazy.'

'Ah! there is a pretty place. Whom does that belong to?' we cried.

'That there,' giving the horses a flick with his whip—'that there belong to a maid. She's fifty year old, and got a bit of money, and she's niver bought a 'usband. Yoo shuld hear har speak. She's got a meetin'-ouse. Oh, she'll talk to ye, and give ye a little book to read, and tell ye aboot no end o' things; but'—giving a knowing look round—'she'll niver give ye neither bite nor sup.'

On we went, passing farm after farm, until we reached a public-house, where Jehu without permission pulled up to refresh his thirsty palate with a glass of ale.

'Do you always pull up for beer?' we inquired.

'Yes, yes,' he replied patronisingly. 'I likes to help them to *pay the rent*.'

We got on theology at last, and here Jehu came out strong.

'Do ye know [pronounced like *cow*] the prayers I say ivery day? I prays in the mornin' that I may do as much good as I can all the day, and as little harm.'

But best of all was when he descanted upon Church versus Dissent, or Parson versus Minister. 'Wall, yoo see the parson he hev tithes ten-and-sixpence in the acre; yes, that's what oi pays' (for Jehu rents land as well as being a cab proprietor); 'and the minister he hev none. But for

all that, I likes the parson best, for in church he do pray "as well for the *body* as the *soul*." But the minister, he *all* for *soul*.'

Who wouldn't have stood Jehu a treat after that! Dickens would have loved him. A friend declared they must have known each other, for he has a face, our Jehu, that brings one back to Cruikshank, who has immortalised it, or one like it, in one or more of his characteristic illustrations. We only wish we could convey the tone and gesture with which each remark was made, and then perhaps our readers would enjoy our drive with Jehu as much as we did, and laugh as heartily. Perhaps, however, they may yet have the opportunity of doing so for themselves.

THE SCOTTISH BANKER'S DILEMMA.

IN TWO CHAPTERS.—CHAPTER I.

MR DUFF, the worthy and respected agent of the Central Bank at Tollkirk, was startled by his teller, James Hamilton, coming to him to say, just as the banker had signed the last official letter before proceeding to lock up the safe: 'I am sorry to say, sir, the cash appears to be one hundred pounds short.' James was very pale as he spoke, and despite his efforts to prevent it, his voice trembled. A stranger could not have told whether the youth's agitation was the result of fright or guilt.

Mr Duff knew him too well to let the latter alternative dwell in his mind for even a moment; but the lad's excitement was somewhat infectious, and it was with just a little throb that he replied: 'You're joking, Jamie.' Mr Duff leaned back in his chair and nibbled the feather-end of his quill as he looked in the lad's face.

'I was never more serious in my life,' reiterated Hamilton.

'It is some mare's-nest, depend upon it,' said Mr Duff in a tone that partly reassured the poor fellow. 'Have you been very busy at the desk to-day, James?'

'That is the mystery of it, sir; we have not been busy. Hardly three pages of our cash-book are filled.'

'A hundred pounds! Him! I am going upstairs to dinner. In the meantime, check your summations and your cash, and by-and-by I'll come in to lock up the safe with ye.'

The teller went from the banker's room to the outer office with a very grave face. Mr Duff, who lived with his family, as is customary in Scotland, in the very commodious house attached to the bank, sent his letters to be copied by the junior clerk, and then went leisurely up-stairs to dinner.

Mr Duff's was, for a man who does not object to permanent residence in a provincial town, a very easy and pleasant mode of life. His work was not hard, nor were his responsibilities very heavy. He had a pretty and comfortable home in an old-fashioned country town, and although his wife lay in the churchyard on the brae by the river-side these ten years, still he had two of the prettiest girls in Tollkirk—Minna and Mary Duff (besides Jenny, the married daughter, who lived in Edinburgh), whose delight it was to make his life sunny and happy. He was naturally—being known to possess private means, and on account of his official capacity as the dispenser

of discounts and custodian of the wealth of the neighbourhood—a man of some importance in Tollkirk, and formed part of, as well as moved in, Tollkirk's best society. He was magistrate and farmer as well as banker; and on Sundays, for many a long year, he had stood beaming behind 'the plate' at the entrance to the 'auld kirk.' Everybody knew him, and he knew everybody; and perhaps nobody respected him the less because he pretty well knew to within a pound or two what every ratepayer on his side of the county was worth, financially.

He took life very easy, as I have said; making no undue fuss when an accommodation bill was presented to him, if he knew—as he was certain to know—the pedigree and progress through life of drawer and indorser. He was respected too by his Edinburgh employers as a man of prudence and sagacity, who never made bad debts, never troubled them with applications for rise of salary or transfer of agency—whose books always stood the minutest inspection, and who, speaking generally, wanted no favours from them. Rather, granted favours, by occasional invitations to visit him at Tollkirk, where there is unsurpassed trout and salmon fishing, besides magnificent 'links' for golf, and where the local distillery yields a liquid of more than local reputation. The city-birds were not slow to accept such invitations, Mr Duff being over a tumbler of toddy the best of company, and generous in the matter of horses and fishing-rods. The chief inspector of the bank came often enough to woo the fair Jenny, the eldest of the family, and took her away with him one summer day, to the general bereavement of Tollkirk.

The banker did not hurry over dinner on the particular afternoon of which I write. When he went up-stairs he did not give a second thought to James Hamilton's pale face, but quietly settled himself in his arm-chair, after doing justice to his simple repast, to read for the second time the report of his own recent great speech at the parochial board, given at length in the *Tollkirk Herald*, the fine roll of his own—somewhat improved—spoken sentences seen in black and white, communicating a pleasing sense of complacency and importance as influencing public opinion. It was nearly seven o'clock before Mr Duff remembered that he had not yet locked up his safe, and that his clerks were probably waiting below for him. He was surprised when he opened the office-door—leading to the hall of his house—to find Hamilton still bending over his cash-book with an expression of deep anxiety on his face, and bundles of bank-notes lying on the desk before him.

'What, James, still in a fog?' he asked cheerfully as he came in. 'Not found your difference, eh?'

'I am a hundred pounds short, sir, without doubt.'

Hamilton had toiled through every entry over and over again, had counted and recounted his bundles of notes, and now had a very sharply defined fear in his heart, and a vision in the background of his imagination of a dearly loved old mother waiting for him at home, and who was ill able to bear the responsibility of such a loss—if loss it should prove to be.

'A mare's-nest, I'll be bound,' Mr Duff said

good-naturedly, taking Hamilton's place before the cash-book. Very carefully and with a keen eye he went over each entry; very carefully too he counted the cash, and recounted it; but only to find that Hamilton's words were too true. The cash was undoubtedly one hundred pounds short.

'I think we had better sleep over it,' Mr Duff said at last, looking at his watch. 'The difference will turn up in the morning, you may depend upon it.' Then the cash and books were carried into the safe, and the office closed for the night.

Poor Hamilton lay awake nearly all night thinking over some probable clue to the whereabouts of the missing money. Never before had he left the bank with such a dread on his mind, for he felt certain he had gone over each item of the day, that he had not over-paid any one to such an extent; and he knew that on him devolved the responsibility to make good any such deficiency. He hardly spoke to his mother as he ate what she called his 'ruined dinner'—spoiled by three long hours' waiting in the oven; nor could she get from him all through the evening a hint of the cause of his trouble. She guessed, and hinted that perhaps Minna Duff, 'the little flirt,' had something to do with his gloom; for she knew how her boy's heart lay in regard to the banker's younger daughter; but her son's reply was equivalent to a snub.

He was in the office two hours before official bank-hours on the following morning; but no trace of the missing money could be found. During the day, all the banker's customers who had on the previous day been paid large sums, were asked to check their payments; but when four o'clock arrived and the cash had again to be counted, the balance still shewed one hundred pounds short. If the money had been paid away in error, no man had been honest enough to return it. Then for the first time in the history of the Tollkirk branch, a deficiency in the cash had to be reported to the head office. A hundred pounds to a rich man may seem a small matter to worry over; but to James Hamilton, whose yearly salary, after ten years' faithful and conscientious service, did not amount to one hundred pounds, and whose mother—save for the help of a trifling annuity left by her husband—was in great measure dependent upon him—the liability to refund this sum weighed heavy. He became anxious and nervous, not being altogether certain that the authorities of the bank might not suspect *him* of having appropriated the money; and from very nervousness was guilty during the next few days of making several small mistakes in his cash dealings, which confirmed him in the belief that he had paid the money to some unscrupulous rascal who did not mean to acknowledge it.

It seemed an age, although in reality barely a month had passed, before a note from Mr Tait, the chief inspector (Mr Duff's son-in-law) set the matter at rest. 'In consideration,' the note ran, 'of the admirable mode in which the business of the branch at Tollkirk has hitherto been conducted, the Directors have agreed to wipe off the deficiency in cash, which it may be hoped will yet turn up and be re-credited; but in doing so it must be firmly kept in view that the Directors by no means establish the present case as a precedent, and must remind the gentleman who has charge of the

bank's cash at Tollkirk that at no future time will the Directors be disposed to relieve him of the responsibility attaching to his office.'

'There, Jamie; take *that* to your mother,' said Mr Duff kindly, handing the official note to Hamilton. 'I thought Peter would manage it' (referring to his son-in-law, the inspector); 'but we maun ca' canny,' said the banker, relapsing into broad Scotch, to put the reproof, if such it might be called, in the gentlest form, to spare the lad's feelings.

There were tears of relief in Hamilton's eyes as he read the note. 'That is generous treatment, sir; I was afraid they would roup [sell by auction] me and my old mother out of Tollkirk.'

'Roup ye? I couldn't spare ye, lad.'

Then the youth went home to his mother jubilant, a burden lifted from him.

But on the next evening, after business hours, Hamilton's face was whiter than ever. His hands were trembling as he fumbled over his cash, and 'cast' and 're-cast' the long columns of figures in his cash-book. It was market-day, a busy day, and large sums had passed into and out of his hands. To his horror, he found his cash *three hundred pounds* short! He had not the courage on this occasion to go to Mr Duff's room with his plaint. But the banker saw at once as he passed through the office on his way up-stairs that something was wrong.

'You are late, Mr Hamilton.' (Mr Duff never in a general way called James 'Mr.' His doing so now implied misgivings.)

'Yes, sir; but I think I won't be long;' his lips felt parched from excitement.

'Are ye ready to lock up the safe with me?'

'Not quite. If you are in no hurry, sir, perhaps we can lock up when you come down.'

'Very well.'

Mr Duff went up-stairs; but on this occasion he did not linger over his meal. When he came down half an hour later, Hamilton was not ready to lock the safe. He was sitting looking into space, his head resting on his hands.

'Have you balanced your cash now?' Mr Duff asked with just a perceptible edge of annoyance in his tone.

'No, sir. I differ three hundred pounds.'

'Over or short?'

'Short, sir!'

'Mercy on us! This will not do. You must bestir yourself and—and find it. I have to go out to a meeting to-night.' The banker spoke sternly.

Hamilton once more, under Mr Duff's eye, nervously went over his figures and counted his cash. The deficiency could in no way be accounted for.

'This is terribly awkward, James.'

There were tears in the youth's voice as he uttered: 'Yes sir; and it will drive me mad.'

When Mr Duff returned from his meeting at eleven o'clock, Hamilton was as far from peace as ever. The younger clerks had gone away. Again the banker and Hamilton went over each item together—in vain.

'We can't report this to the head office, whatever happens,' quoth Mr Duff grimly.

'What is to be done, sir?'

'Find it!'

They looked blankly in each other's faces.

Both men went to bed with heavy hearts; nor did the search next day throw any light on the mysterious transaction. Mr Duff could not bring himself to report this second deficiency to his head office; and the only alternative left was to refund the amount from his own private means. This, as may be imagined, he did very reluctantly; and for the first time in his experience he watched the younger men, and perhaps his trusted teller too, with just a faint and irrepressible glimmering of suspicion. A mistake of this sort might happen once; but to happen a second time at so short an interval, made him uneasy on other matters than mere loss of money. He had a framework of mahogany and glass made for Hamilton's desk, so that no one could come near the cash in future but Hamilton himself. And so, with what grace he could summon, and with many grave warnings, Mr Duff paid the 'short' money, having, as he said, to 'grin and bear it.'

For a week or so things worked well under the new arrangement; but for the third time Mr Duff was destined to see Hamilton poring over his books long after bank hours, this time to hear on inquiry that the luckless lad was short by no less an amount than five hundred pounds! Had the shrewd, quick-witted James Hamilton, after ten years of faithful service, become suddenly dolt?

'This is beyond endurance,' the banker said sharply, as the fact was communicated to him.

'It is most strange,' replied the helpless teller, feeling that the Fates were against him.

'It is impossible you can have paid the money away.'

'It is gone, sir.'

'Then you *must* find it. I can no longer be responsible for your blunders. Here is no less a sum than nine hundred pounds in less than six weeks to be accounted for. Many a one has been sent across the sea for less.'

The youth put his hands over his face and fairly burst into tears. 'I must give it up, sir. I can't stand this. I must leave the place.'

Mr Duff was looking at him with very keen eyes as this was sobbed out. 'Leave Tollkirk? Understand, Mr Hamilton, that you *dare* not leave Tollkirk before this matter is cleared up.'

For the greater part of the night the men sat up searching; but when the morning came they were as far from the mark as ever.

Mr Duff, much to the surprise of customers of the bank, next day 'took over' the cash himself, and, rather awkwardly from want of practice, became his own cashier. Hamilton was degraded to subordinate duties. His spirit, poor fellow, was fairly broken. No trace of the missing money could be found. Of course Mr Duff could not long continue acting as teller. The work interfered with even more important duties.

A son of Mr Traill the parish minister, who was employed at the Aberdeen branch of the same bank, at this time visited Tollkirk, and being of the same craft, spent a good deal of time in Mr Duff's company. The subject of the missing money was broached and discussed between them. It so happened that George Traill was engaged to be married to Mary Duff; and the banker having lost confidence in Hamilton, and feeling sorely in need of capable help, proposed that George should apply to the Directors of the bank

for the appointment of joint-agent or partner with himself in the management of the Tollkirk branch. So it came about that in a short time George Traill, a shrewd, practical business man, relieved Mr Duff, at the telling-table, in order to familiarise himself with the faces of the bank's customers. For some days all went well. Then came market-day. At close of the day Mr Traill's cash was five hundred pounds short!

ODD AND WHIMSICAL FUNERALS.

THESE are some people whose love of singularity is not limited to the scenes and events which they themselves may witness or enjoy. They may be said in one sense to wish to live again on this earth after their death, and to participate in their own *post-mortem* celebrity. This eccentricity is not confined to the questions whether or not their dead bodies shall be inclosed in coffins for interment, nor whether they shall be buried standing up, sitting down, or prostrate on their backs. (See 'Burial Eccentricities,' *Chambers's Journal*, September 22, 1877.) It manifests itself also in the vestments to be worn by the deceased in the grave, the procession or cortège to the place of interment, the selection and treatment of the mourners, the position and materials of the grave, the nature and arrangement of the tomb or monument, and the provision for keeping it in repair. Individual whimsicalities these, not belonging collectively to any special nation, creed, age, or profession.

Feasting and drinking at funerals used to be carried to great lengths, and it is only in recent times that this form of unseemly extravagance has disappeared, except in remote situations. Pretentious display was also carried to extremes. At Old Swinford, in Worcestershire, some years ago, a coffin on being opened was found to contain the remains of a lady dressed up in a full old-fashioned costume; there were a multiplicity of pins in her dress, all blackened with age and tarnish. In 1763 a young lady, in fulfilment of her last request, was buried in her wedding garments—in this wise: Her white negligée and petticoat were quilted into a mattress, pillow, and lining for the coffin; her wedding shift was used as a winding-sheet, with a fine point-lace tucker, handkerchief, apron, and ruffles; a point-lace lappet was on her head; and she wore her earrings, finger-rings, necklace, white silk stockings, and silver-spangled shoes with steel buckles.

Many persons in medium circumstances formerly made a great effort to emulate the magnificent at the burial of their friends. A case in point was that of a cheecsemonger in Thames Street, whose body 'lay in state' for a week, and was followed to the grave by a train of coaches each drawn by six horses, and flanked by mutes and flambeau-bearers. The Emperor Charles V. is said to have rehearsed his own funeral, to see and hear how it would 'go off.' Tomb, coffin, black trappings, monks, domestics, taper-bearers, all were duly provided; and the imperial recluse

(he had abandoned the splendours of sovereignty over Germany, the Netherlands, Spain, Naples, Sicily, and the Indies, and retired to a monastery in 1557) caused himself to be carried in his own coffin. Not only did he hear his own requiem sung, but joined in it himself! His funeral obsequies were observed in reality soon afterwards. A somewhat less important person in the eyes of the world was Mrs Margaret Crosins, of Cuxton in Kent, who was buried (in 1783) in a costly dress of scarlet satin. During her lifetime she caused a pyramid-shaped monument to be erected; under it was a vault with a glass door, a green-silk curtain in front of the glass, and a lock and key placed inside. Resting on tressels in the vault her mahogany coffin was placed, but not fastened down. Gossips would have it that she had provided the means of letting herself out, in the event of reviving after interment.

In a great number of instances, oddity has been more studied than magnificence, costliness, eating, or drinking, at the funerals of whimsical folks. A dust-contractor in the days of George IV. left instructions that the procession following him to the grave should comprise twelve boys carrying links, twelve men carrying dustmen's whips and shovels reversed, a favourite horse provided with cloth spatterdashes, a dust-cart covered with black baize, the coffin in the cart, surmounted by a very large plume of white feathers, twelve dustmen and brickmakers as pall-bearers, all clad in white flannel jackets and leather breeches; the whole wound up by a long string of carts filled with dustmen, cinder-sifters, and chimney-sweepers. A few years earlier, one Mr Woodford, of Fetter Lane, displayed oddity with a little more gentility than the dust-contractor. Being a member of the Lumber Troop (a Volunteer corps in the City of London), he left instructions that after his death his body should be carried to the troop-room and thence borne by troopers to the grave; that minute-guns should be fired during the funeral procession; that a military salute should be fired over the grave in St Bride's Churchyard; and that a crooked guinea (crooked, we presume, for luck) should finally be spent in punch and tobacco to regale the troopers. A crotchety old Yorkshireman about half a century ago left directions that the day of his burial should be ushered in with a great public breakfast in the town where he might die; that the coffin, slung upon towels knotted together, should be borne along by relays of men, and 'bumped' three times upon a particular heap of stones; that the *Lamentation of a Sinner* should then be sung; and that every man, woman, and child who entered the churchyard with or after the procession should receive a dole of sixpence. Never, we may fairly believe, was that particular churchyard before or since so plentifully filled with living beings: mourners only in this sense, that they longed for a succession of men who would order their funerals in similar fashion. One old lady, an inveterate snuff-taker, left a will in which the bequests were mainly dependent on the observance of certain rules connected with her favourite excitant. Snuff was to be thrown into the coffin before the snuff-taking testatrix was 'screwed down'; snuff to be strewn on the threshold before the funeral cortège passed out; the coffin to be borne by the six most

determined snuff-takers in the parish; six old maids as pall-bearers, with well-filled snuff-boxes in their hands; snuff to be strewn on the ground at every twenty yards in advance of the coffin; and the officiating clergyman's large retaining fee to be in some way proportionate to the quantity of snuff he took during the ceremonial.

An eccentric Nottingham man known as Ned Dawson was strong in his Toryism as in his eccentricity. He caused his coffin to be made during his lifetime, and painted true-blue (the Tory colours). He used it as a cupboard for twenty years; but once each year, on the anniversary of his birthday, he brought it into requisition in a still more singular manner. He dressed in his best clothes, and lay down in his coffin to see that it was all right in dimensions; then emerging, the coffin was filled with goodly viands, and carried on the shoulders of his associates, he himself following as chief-mourner with a large pitcher of ale in his hand; and so the procession made a tour of some of the rooms and passages of his house—ending, as may be readily guessed, in a repast partaking of the nature of a 'jollification.'

Early in the present century one Captain Backhouse, a military man who had been in the East India Company's service, was buried in a style singular enough though not outrageously extravagant. He built himself a house in eccentric fashion at Missenden in Buckinghamshire, and made anticipatory arrangements for his funeral, certainly marked by no great reverence for established usages. 'I will have nothing to do with the church or the churchyard; bury me in my own wood on the hill, and my sword with me; and I'll defy all the evil spirits in existence to injure me.' His remains were deposited according to his will. A kind of dwarf pyramid of flints and brickwork was constructed, about eleven feet square by fifteen feet high, with a small Gothic window on the north side and another on the south. Being partly overgrown with ivy, and in a thick plantation on the top of a hill, it is about as far removed from the eye of a passing stranger as a monument can well be. The coffin is placed upright in the tomb, and the captain's sword on the top of it. One of his descendants, some years afterwards, wishing to consult public sentiment a little more closely, had the coffin quietly removed from the pyramid and interred in the parish churchyard.

The Rev. Langton Freeman, who was rector of Bilton, in Warwickshire, about a century ago, did his best to obtain for his own funeral a very detailed attention to his own wishes, by certain clauses in his will. 'For four or five days after my decease and until my body grows offensive, I would not be removed out of the bed or place I may die in. And then I would be carried in the same bed, decently and privately, to the summer-house now erected in the garden belonging to the dwelling-house where I now inhabit, and to be laid in the same bed there with all the appurtenances thereto belonging; and to be wrapped up in a strong double winding-sheet, and to be in all other respects interred as near as may be to the description we read in Holy Scripture of our Saviour's burial. The doors and windows to be locked and bolted, and to be kept as near in the same manner and state as they shall be in at the

time of my decease. And I desire that the building or summer-house shall be planted around with evergreen plants, and fenced off with iron or oak palings, and painted of a dark-blue colour. And for the due performance of this in manner aforesaid, and for keeping the building ever the same, with the evergreen plants and the palings in proper and decent repair, I give to my nephew Thomas Freeman the manor of Whitton, &c. The wishes of the testator were duly carried into effect. When two or three generations however, had passed away, and the tomb was well nigh forgotten, an entry was effected by making a hole through the roof, and there the body of the old rector was found nearly dried up. Of course there is no entry of so very unclerical a burial in the parish register, for his successor in the parish could not have signed it if he would.

Some persons, as we have already said, seem determined to make merry after they are dead, or at least afford their survivors the means of doing so. One old man left a bequest to a City parish on condition that the church bells should ring a merry peal once a year; but there was a dark side to this picture, for the peal was to be rung on the anniversary of his wife's death, whereas a tolling was to mark the anniversary of his wedding-day. An advocate of Padua in the sixteenth century directed that none of his relatives should shed tears at his funeral; singers and musicians should be engaged to supply the place of mourners; fifty of them were to walk with the priest before the coffin, each receiving half a ducat as a fee; twelve maidens in green habits were to carry the coffin to the church, singing cheerful songs as they went; lastly, all the clergy of Padua, and all the monks except those who wore black hoods, were to be invited to follow. Every man to receive an honorarium. A Frenchman who died about half a century ago had some time before left instructions concerning the mode in which his obsequies were to be observed. All the musicians of the town were to be invited to attend, and play dancing and hunting tunes during the procession; his house and the church were to be decorated in the liveliest way possible; and (but this must have been a very difficult point to settle) his property was to go to the relative who laughed the most joyously on the occasion.

Some men (in the old days) directed that they should be buried in the very substance of church walls; some that their hearts should be interred separately, or kept in an urn, or bequeathed to a church or a monastery. In a particular lease of a small estate, one family had a right of interment in the garden of a house occupied by another family, leading to a strange mixture of scenes witnessed from a drawing-room window.

A bequest as curious in its provisions as any of the foregoing, comes to us from America: Mr John R. Reid had been gas-manager of Walnut Street Theatre, Philadelphia, for fifty-four years, during which long period he is said never to have missed a single performance. In his will was the following provision: 'My head shall be severed from my body, and my body shall be placed in a vault; but the head shall be brought to the Walnut Street Theatre, there to be used as the skull in *Hamlet*, and I do bequeath my

head to the said Walnut Street Theatre for that purpose.'

[In offering the foregoing examples of eccentricities connected with burials, we would take the opportunity of adding that in all civilised countries there prevails amongst surviving friends a more or less ardent desire to decently bury their dead. This is as it ought to be, and is a feeling which will doubtless continue to exist. Amongst certain classes, however, there prevails what we might term an exaggerated idea of what is due to departed friends. No expense is spared to turn out what is termed a 'respectable funeral,' which in too many cases tells sadly upon the means of the well-meaning but foolish persons involved. Pomp and show far beyond what is required, or indeed what is seemly, take the place of what ought to be a soberly ordered ceremony. A costly array of carriages, and a needlessly incurred cost for funereal trappings, involve the victims to an extent which, though ignored at the time, too frequently cripple the family resources. We also take occasion to remonstrate against the vain practice lately introduced of interring the bodies of relatives in strong and elegantly constructed oak coffins. The practice is not only costly, but positively mischievous in retarding dissolution into that dust which is the universal doom and privilege.—Ed.]

GOLD DREDGING ON THE CLUTHA.

GABRIEL, a shepherd, tending his flocks on the billowy downs and placid flats of Tuapeka, in Southern New Zealand—deputy-lord of a solitude seldom broken by human footfall or other sound saving the occasional grunt of a wild pig or the impatient cry of a few paradise ducks in eager flight to inland waters—was the man who, on the fourth day of June 1861, broke the spell of pastoral simplicity under which the province of Otago had lain since its first settlement, by the discovery of gold. 'Gold in New Zealand!' The words rang through the Australian diggings like a call to arms. Veteran gold-diggers who had served their novitiate on the streams and plateaux of California, to whom the diminishing returns of Victorian fields had become a weariness, jerked aside the implements of their industry, and declared that they were wanted 'than' Quartz-reefers and puddlers from Bendigo and Kangaroo Flat, ground and box sluicers from Jim Crow and the Ovens, and miners from the deep gutters of Ballarat, hurried, as in desperate case, to take ship from Melbourne. The tent of the prospector glinting white in the depth of the forest, knew its place no longer. Away over the seas, in the gully opened by Gabriel, its place should be, where the yellow metal lay thick strewn and plentiful, and might be washed with ease from its earth-wrappings.

Thus it happened that before the flock-owners and other few settlers of Otago had fully recovered the composure disturbed by Gabriel's discovery, there came to the jetty at Dunedin shipload after shipload of high-booted, free-handed, *debonair* gold-hunters, equipped at all points for the self-reliant

prosecution of their search, and eager to contest their right to 'follow the gold' with any who might gainsay it. Spreading themselves over the face of the bald treeless country, they explored and tested its secret places, unearthing hoards hitherto concealed. Nor did it take long to gather the richest of the golden spoil; for where the precious grains lay thickest, they lay at little depth from the surface of the ground; and as these diggers gave themselves to the work under a sense of territorial right, the areas of country to which they devoted themselves soon shewed evidences of their activity. Soon the flowing lines of the low downs were broken by intersecting trenches and mounds of upturned alluvium, the level expanses of the valleys heaped with the detritus from innumerable excavations, and the whole landscape crowded with inartistic detail. But withal, the country was made glad with the play of human life; towns, to be towns in perpetuity, were founded; Commerce built her palaces; and patient Agriculture took such courage that soon, alongside the golden fleece, the golden sheaf was quartered on the provincial shield.

At an early period of the 'rush,' the probable secretions of the Clutha river afforded a theme on which miners loved to speculate, though for a while none save the most adventurous tempted discovery beside its waters. The Clutha, greatest of all the rivers of Southern New Zealand, has its sources in the Lakes Wakatipu and Wanaka, the former being by far the larger of the two lakes. The clear bright water of the Wakatipu, extending from the base of the dividing range in a south-easterly direction, mirrors the pinnacled mountain ridges by which it is bounded in a surface some fifty miles in length by five miles in breadth. Its depth is untold; at least so say mystery-impressed citizens of Queenstown, who dwelling on its shore, have made it their highway to south and west. Distant some thirty miles from the Wakatipu, the Wanaka sends its overflow to join the stream from the sister lake. The impetuously hurrying streams rush together at the township of Cromwell, and seem to dispute for a time the common passage to the sea; for the heavier volume of the Wakatipu branch, now subsidised by the contributions of the Shotover and Arrow rivers, pushes aside the less forceful sweep of Wanaka waters, till a union is compelled by impeding slips from the neighbouring mountain-range. Then the savage Clutha speeds on its way in power; through rock and ancient lake-bed it surges and roars, as it cuts still deeper the furrow already defined by high ramparts, and carries to the Pacific tribute of the pilfered land.

Hartley and Reilly are the names of the men who secured the bonus offered by the New Zealand government to whomsoever should open payable gold-workings on the Clutha; and they made their discovery some two years subsequent to the discovery by Gabriel. The season had been propi-

tious. Over the whole extent of country drained by the river and its tributaries, the snowfall and rain of the year had been light. The river, stinted in its supplies, ran at a very low level, leaving long strips of pebbly strand exposed to the scrutiny of the prospectors. In these strips of accidental beach the men found their coveted opportunity, and plying pick and shovel, discovered, underlying the loose gravel and boulders, a stratum of tightly compressed brown clay, the crevices of which were in places filled with the lustrous particles they sought for. Self-isolated in an almost naked country, these two men had thus quieted doubt as to the wealth of the river; and if through some invisible telephonic apparatus the certified fact had been sent vibrating through the length and breadth of the low country, the secret had scarcely been disclosed with more immediate effect. Over the jagged spurs and steepes of the Lammerlaw ranges—ranges beset by all the dangers of torrent and precipice, and as yet unmarked by any well-assured pathway—the roused diggers of the lower country, heavily burdened with their equipments of tents, bedding, and rations, urged their way to the river. Strings of pack-horses, laden with all sorts of stores and merchandise, picked their steps over the difficult country; and even woman herself lent her accompanying presence to the advance.

One hundred and ten miles from Dunedin by the mountain road, the Clutha careers through the Dunstan Flat. Here it is a river from eighty to one hundred yards in width, with a current varying to perhaps thirty feet in depth, moving at the rate of about six miles an hour. From its western bank, a semicircular plain recedes, hemmed in by winding spurs and offshoots of the Old Man Range, whose topmost peak, the Old Woman, is some eleven thousand feet above sea-level. At the foot of the Old Woman, the township of Clyde arose; a township reared of calico, biscuit-tins, and gin-cases. For a while Clyde flourished and disported itself in wanton riot. But as the busy thousands were yet delving in bank and beach, the rays of a summer's sun fell on the wide and deep-lying snows of a hard winter; the river resumed its wonted volume and velocity, and the beach-workings were flooded by the swift-flowing current. Then a general abandonment of the river ensued. To the gorges, creeks, and terraces of the adjacent country, a country scarcely tenable in its bareness, but over which gold in small quantities lay scattered, the unlucky dwellers in tents to whom the genius of the river had been unkind, were fain to remove their domestic gods. Reticent men on whom fortune had smiled, withdrew from the rock-bound region, and the river was left in possession of the 'shepherds,' who for months awaited its subsidence; and those rarer spirits, endowed with giant will and strength, who set themselves to resist its encroachments. These latter were the men who fenced the beaches in. They would wade out mid deep in the cold snow-water, building up bags of sand or slabs of rock, till the walls rose above the stream, and inclosed the space sufficient for working pur-

poses; then, by perilous toil of pumping and excavating, they laid the inclosure bare to the gold, and won their reward. Still the revived river maintained its ascendancy; the sounds of revelry waned daily fainter in Clyde; and the town shrank disconsolate within her borders.

It was high-holiday in Clyde the day on which the first dredge was launched—an apparatus that was to make its owners independent of low rivers and dry beaches. Nearer to the front of civilisation, the event would have attracted but little notice perhaps, for the dredge exhibited no novelty in floating architecture, and except for its deck-furnishings, was in fact not different from any ordinary flat-bottomed barge. But it had been built at considerable cost; its planks had been hauled from the Tapanui bush fifty miles away; its anchor, winch, purchase-chains, and shore-lines brought by wagon from Dunedin; and Clyde took pride in it, as giving tangible proof of its own irrepressible enterprise. All the town was at the launch. The mayor and town-councillors; for Clyde, with a population of one hundred and fifty or one hundred and eighty, was now incorporated. The proprietor and editor of the *Dunstan Times* was there; for Clyde, elevated to civic dignity, supported a gazette of her own—a gazette, moreover, with a motto which gave rather exceptional moral status to the town. 'In the hands of men supremely just, the pen is mightier than the sword'—so the motto ran. Old Plodge, master-shipwright and builder of the craft, his face wrinkled and set to stern importance, stood by the bows; and Big Andy, who had received his appointment as skipper, held to the steer-oar. For who better than Andy knew the reaches and beaches of the river, the eddies and swirls; in what places the gold had been traced into water too deep for the paddockers to work in, and where the duffer ground lay! No more nautical man than he could be found on that river. A Shetlander by birth, he had as a boy played on rocky ledges where sea-fowl laid their eggs; and as a man had followed the sea round the headlands of every continent. He knew the work; and integrity looked out from his merry resolute blue eye. Of course the *Dunstan* pen of justice recorded for the world its tale of the proceedings. How the fair hostess of the *Clyde Hotel*, gallantly directed by Old Plodge, took fair aim at the bows of the vessel with the orthodox bottle of champagne, and named her after the town; and how the people raised cheer upon cheer, as Big Andy, steer-oar in hand, guided the craft down the current to her anchorage below Hospital Point.

At 10 P.M. of a certain night in the merry month of May 1870, the *Clyde* dredge lay over good gold. She had struck the metal heavy in about ten feet of water, and her 'spoon' was kept busy night and day. At the hour named, the night-crew, captained by Big Andy, were assembled on the beach to go off to their night's work. Tyke also was there. Tyke! the skipper's wonderful tailless dog. Not even Andy knew of what breed Tyke came; or how, unlike ordinary dogs in that as in other things, he should have but the merest apology for a tail. It was said that he was of the Smithfield breed of drover-dogs; but whatever his origin, the children of the Dunstan Flat would uphold him as the kindest and boldest dog in all the colony. They would dress him in cap and

vest, put a short pipe in his mouth, and at a sign, he would rise on his hind-legs and walk about, a wonder of canine pedestrians. But let the biggest dog in the district cast a supercilious eye on him as he engaged in this self-sacrificing amusement, and Tyke would instantly vindicate his own dignity by testing the courage of his critic.

This particular night being dark, Tyke appears in front of his master with a lighted lantern swinging from his mouth, which he puts down beside the boat, and now with deprecatory air awaits further orders. 'All hands here? Right!' says Andy. 'Let us get aboard.—And Tyke, you go home!' whereupon Tyke vanishes in the darkness, and the boat is shoved off. The oars are not wanted, as the force of the river is itself the motive-power used to propel the boat to the dredge. It is a common practice on the river to utilise the current in this way. All coaches, wagons, and bullock-teams that cross the stream are punted over by contrivances similar to this on which the dredge's crew depend for transit. A line is stretched taut from the shore to the dredge, which lies out in the stream; and on the line is placed a blocked sheave, so that it runs freely along it. To the eye of the sheave-block the boat's painter (bow-rope) is made fast; then by movement of the rudder the boat is laid across the current at an angle of forty-five degrees or so, in which position it receives on one side alone the impetus of the rushing water, from which it recedes, followed along the line by the running sheave to which the boat's painter is fastened. In this way the deck of the dredge has been gained; and after the boat has been secured, and the kerosene lamps lighted, all is declared in readiness for a start. 'Over!' cries Andy; and the dark sullen gleam of the river, as it hurries from the beaming light of the lamps, is fretted for a moment with white spray where the heavy spoon strikes it in its descent to the bottom. 'Heave away!' presently comes the voice of the skipper; and the three men at the winch bend to their work, as the purchase-chain is slowly coiled round the drum, and the spoon reappears above the surface of the water filled to the lip, from the top layer of loose non-auriferous gravel that must be cleared away before the golden dirt can be reached. The spoon is a bag about four feet deep, made of thick sole-leather riveted together with copper rivets. The open end of the bag is laced with thongs of green hide round a circular iron rim, of about thirty inches diameter. From the outside of this rim, at right angles to the pendent bag, a socket projects for the reception of the spoon handle, a Manukau pole about thirty feet long; and opposite the socket, the lip of the spoon, a well-tempered steel-plate, rises above, and is carried for a third of its circumference round the top surface of the rim. Sympathetic movement of spoon and winch is insured by the purchase-chain, which passing over a loose sheave in the craned neck of the davit, connects the two.

The work of the night proceeds. There on the deck, unwound from the barrel of the winch, lie several yards of slack-chain. Hughie the cradleman takes a grip of this chain some two feet back from where it passes over the davit-sheave to the spoon attachment; while Jack the paddockman seizes the spoon by the rim and lifts it as Hughie

pulls on the chain. The skipper has taken the spoon handle on his shoulder; and as Jack swings the leathern excavator over the side, Hughie lets go his hold of the chain; the spoon falls on the water; the slack-chain flies through the davit as the current sweeps into the leather-bag, which, humoured by Andy, is borne to the very spot on the river's bed into which he intends to dig. The skipper takes two turns of the stopper-rope round the spoon handle, that the spoon shall not recoil from its sub-aqueous work; then once again his cheery 'Heave away!' is heard; the winch goes round, and the spoon moves through the gravel down below. So long as the clearing away of the loose drift-gravel continues, the spoon appears and disappears at short intervals, as there is comparatively slight resistance to its progress along the bottom. The work goes on quietly and smoothly. Jack, whose business it is to keep the paddock clear, and who is, moreover, an adept in the use of the long Yankee shovel he flourishes, having to return all this barren stuff to the river over the stern of the dredge, is the most hotly engaged at present.

'Any amount of tailings coming up to-night, Hughie,' he remarks to the cradleman, who is assisting ubiquitously till his cradle is wanted.

'O ay; that's the way of it,' replies Hughie; 'a shipload of tailings to an ounce of gold, Johnnie.'

But presently there is a change. Hitherto the men at the winch have kept the drum revolving in even steady motion. Now they stand straining at the handles in the freezing atmosphere, perspiration pouring from them, and the pinion-wheel refuses to budge an inch. Hughie and Jack jump to the rescue, and the skipper unwillingly slackens his stopper, for the sharp lip of the spoon has cut into the hard cemented boulder-wash in which the precious metal lies. 'Try it again. Something must come, or something must go!' cries Andy; and as he speaks, the men heave with a will, and the spoon slowly comes. As it is swung on deck this time, it will be observed that its contents differ greatly from the stuff it has brought up previously. Here is no longer a bag packed with clean-washed vitreous-lustred quartz and schistose shingle; but a bag of smooth water-worn pebbles, nestling in black sand, flecked with golden spangles and nodules, and shewing boulder-stones of felspar white as the new-fallen snow, and deep-hued porphyritic greenstone veined in lighter shades.

'You had better go to the cradle, Hughie; the child's crying,' says merry Andrew the skipper.

'Ay, ay,' responds Hughie. 'We'll have to bring up the child in the way it should go, I suppose.'

'Was that the way they brought you up, Hughie?'

'Faith, I wasna brought up at all; I was draggit up,' says Hughie mournfully.

'Well, then, they didn't give over dragging till they got you up a good height, Hughie.'

'O ay,' answers Hughie, taking off his Scotch bonnet and exhibiting a bald pate as he goes to the cradle; 'they draggit a' the hair oot o' my head, the caterans.'

The cradle occupies a space at the opposite side of the dredge to that at which the spoon works. It oscillates on rockers, as other cradles do. It is shaped like a baker's trough, its length being

about five feet and its height two. One end of it is open, and projects over the side of the dredge, so that the sand and fine grit that pass through with the water may escape freely. Inside, the cradle is fitted with two plush-covered wooden slides, the one discharging on the other at a sharp angle to the plane of the cradle. When the machine is in motion, the gold and silt are sifted from the gravel on to these slides—the gold by virtue of its density remaining—through the holes in the hopper-plate, over which the coarser dredgings travel, and drop once more into the river. Water falls, shower-bath fashion on the hopper, from a cistern into which it is pumped by the up-and-down movement of the same handle that rocks the cradle. And now the cradle is in full swing, Hughie rocking away at high-pressure as Jack fills the mouth of the hopper with the rich provender lifted by the spoon.

Arduous, straining work to human muscle and sinew, and monotonous to the senses, is this same dredging by night in the black flowing Clutha. The surrounding darkness yields no surprise to the eye; and though you may gaze into the cold depths of that austere firmament where the stars tremble, till you fancy yourself attended into space by relays of visual force, the 'Heave away!' of the river-god who handles the spoon will recall you from the exploration of infinitude, and still your fancy in muscular effort. By-and-by the bottom of the boulder-wash is touched, and Andy springs to the bag to examine the slices of stiff brown clay, speckled with yellow, that appear on its surface as it is hauled on board.

The skipper is in great glee to-night; he pitches his yarns with gusto. In disengaged moments he indulges in a step or two of the sailor's horn-pipe; anon there is given to the darkness a rhythmic souvenir of far-away Shetland, as he sings some old-fashioned Scandinavian ditty. Or visions of sunny Victoria inspire him, and he calls on his mellowest accents as he looks into the night and sings:

Scrumptious young girls, you tog out so finely,
Adorning the diggings so charming and gay;
With your beautiful smiles you look so divinely,
That lovers come round you their homage to pay.

Again he cheers Hughie and tells him that when he is rocking the cradle for the wife, he won't forget the good training he's had.

And thus the toilsome night wears on, till suddenly a faint wan streak sharpens the outline of the eastern hill against the dim background:

The yellow Dawn
Wanders along Night's borders, like the fawn
First venturing from its dappled mother's side—
A timid bound on darkness, swift withdrawn,
Then bolder tried again, the starlight dies.

And presently the snow-frilled brow of the Old Woman is radiant in the smiles of the new-born day. The sullen river, kissed by the morning sunbeams, glides along more lightsofely, and King Frost mitigates his claims in presence of the King of Light.

'Three pound-weight; not so dusty!' the skipper remarks as he secures the product of the night's work. 'Let us get ashore.' And so ashore we go, and then to tent and blankets.

THE MAGPIE AND THE RAT.

A CORRESPONDENT in the north of England favours us with the following anecdotes relating to the above-mentioned well-known animals.

'About three months ago I brought a tame magpie with me out of Staffordshire to my residence here, and shortly after its arrival, it flew on to the window-sill of my sitting-room, seemingly frightened; and on looking out of the window for the cause of its sudden appearance, I found several wild magpies in some trees opposite the window chattering away very loudly to the tame one, which I found they must have previously assailed, as it was strutting about on the sill and chattering back to them in defiance. A short time after this occurrence, Mag flew to the window and knocked on it with its bill, which it invariably does when wanting food. The window was opened, and some pieces of bread put out, one of which Mag immediately picked up and flew with into the trees referred to, and gave it to one of several wild magpies which were there; and this performance Mag repeated several times until it had fed the whole lot of them. And many times during the heavy storm we had at the beginning of the year, Mag fed these wild magpies, who no doubt would have often been sorely pinched for food but for the charity of my bird. But Mag's benevolent deeds, I am sorry to say, are counterbalanced by very bad ones. One of the latter I will relate. On Saturday morning last, my aunt before leaving her bedroom put her watch into its case, fastened it up, and placed it on the mantel-piece. Now Mag must have been at the window and witnessed this; for as soon as the lady's back was turned, the wily creature flew into the room, unfastened the case, which was fastened with two hooks, opened it, abstracted the watch, and broke the glass; and was just on the point of flying off with it, when my aunt fortunately returned to the room just in time to rescue her watch from the feathered thief.

'Not many hundred yards from here, in the village of Sparrow Pit, which is distant from Chapel-en-le-Frith about three miles, there is a farm occupied by a Mr William Turner. This gentleman has on several occasions lately missed some eggs from the place where his hens lay; and one day last week he was accidentally let into the secret of their theft, when upon entering his yard, he was amazed at being the spectator of a wonderful amount of instinct displayed by two rats, one of which had a hen's egg across its shoulder, with its two fore-legs turned round over the egg as far as they would reach to hold it on; whilst the other rat had hold of its tail, by which it was pulling it across the yard, egg and all, to where their holes were. Such a feat as this for two rats to perform seems almost incredible; but nevertheless it is a fact, as the gentleman's word who witnessed it is to be relied on.' [This intelligent method of abstracting eggs has been witnessed before. Sometimes the first rat incloses the egg by clasping it firmly with all four legs, while the assistant rat drags it, egg and all, to a place of safety.—ED.]

PRICE 1½d.

PERVERTED INGENUITY.

It has often been remarked that the amount of ingenuity applied to unworthy purposes might, if directed to honest pursuits, be rewarded with prosperity and happiness, instead of so often reaping a harvest of detection and disgrace. It is not however, very flattering to our vanity to know that while sharpers and swindlers abound, there is never any lack of ignorance and credulity to keep up the supply of dupes, in whose simplicity, imposture and assurance find an easy prey. Continual disclosures of fraud seem to have little effect in acting as a warning to imprudence, or in bringing about further public safeguards against repetitions of this form of dishonesty, the victim being generally caught by the same much-used but apparently not yet worn-out baits of the unscrupulous. Even the cautious may, as we have repeatedly shewn, occasionally be victimised by bubble companies and other cunningly contrived pitfalls; but tradesmen are constantly being taken in by the same transparent tricks, exposed by police reports every week. A person goes for instance, into a shop and orders goods to be forwarded to a certain address—that of a respectable householder. The things are sent there, and left; and in due course somebody calls at the house, saying that he has come from the shop for the parcel, as it had been left in mistake. The parcel is delivered up to the supposed shopkeeper's messenger, who of course decamps with it and is never heard of again.

Numbers of Londoners lately fell victims to the feathered cheat of a certain bird-fancier before it was found out. In his window was exhibited a cage containing two birds, one an ordinary greenfinch with such plumage as Nature had been pleased to endow it; the other, also a member of the same family of birds, but as pretentious a humbug as its fellow was the reverse. On the head of the unconscious bird was a snowy top-knot, while plumes of brilliant colours branched out from among the ordinary feathers of its tail, glue having unquestionably

something to do with the appearance of its borrowed plumes. Yet this palpable burlesque of a tropical bird was palmed off on numerous unsuspecting persons by the vendor, who pretending ignorance of its name and value, trumped up some story about a nautical friend of his having brought it home from 'foreign parts.' Appearing indifferent to its supposed rarity, and not caring to be bothered with the unknown specimen, in a sudden fit of generosity he parts with it to the purchaser for the absurd consideration of a sum ten times its real value.

It is not often that what is known as 'shop-lifting' brings much ingenuity to the fore, yet there are sometimes rather remarkable exceptions. One of these may be instanced in the female shop-lifter not long since arrested for committing robberies from drapery establishments in a somewhat singular manner. When setting out for her predatory expeditions she wore large flat shoes, and had the toe-part of her stockings cut off to form a sort of mitten; and being very dexterous with her toes for prehensory uses, she was able to pick up articles from the floor and secrete them in her slipper. In looking over some pieces of lace in a shop, she had, while the assistant's attention was directed elsewhere, dropped one or two and adroitly secreted them as described.—As bright an example of perverted ingenuity was developed in Paris during the time of the Exhibition. Three persons it seems are necessary to carry out the trick, the *modus operandi* of which is as follows. A man accompanied apparently by his wife and daughter enters a shop in which the articles lie about a little carelessly, and the gentleman at once goes up to the head assistant behind the counter and makes a confidential communication. 'I must warn you,' he says, 'that my wife is afflicted with kleptomania. Be so good as to watch her, but not to say anything to her which might make her think you have any suspicions.' The elder lady is consequently watched with great care, all the shop being on the alert. Some article is pilfered in due course—the theft noticed; and the gentleman on going out quietly and promptly pays for what

has been taken. While the shopkeeper is congratulating himself on the honesty of the husband, the trio are making off with a valuable booty secured by the younger lady, whose movements had not been watched at all. But the best part of the stratagem remains to be told. In case the disappearance of the articles really stolen should be perceived a little too soon, and the party be followed by the indignant shopkeepers, nothing is easier than to express regret and surprise that there should have been other mistakes, and to return the articles with profuse apologies. By this ruse a considerable degree of safety is insured even if the swindlers are balked of their booty; the scheme provides for escape as well as for success.

A German in Paris lately adopted a plan which was successful in despoiling shopkeepers of their goods. Provided with a loaf of bread, which he carried unconcernedly under one arm, he would saunter up and down in front of the shop-windows, till watching his opportunity, he would seize some small article exposed outside or otherwise within his reach, and secrete it in his loaf. Suspected, and at last arrested, he was subjected to a strict search, and was on the point of being released, when some one thought of the loaf, which the accused had laid unnoticed on a form. On examining it, a watch, some rings, and other missing articles were disclosed to the surprised spectators, and another swindling dodge thus exposed. —Equally successful for a time was another system of robbery practised not very long since in the streets of London. A man dressed like a clergyman would walk about the crowded thoroughfares carrying a half-opened umbrella in his hand. Innocent as that useful article appeared, it was acting all the time as a convenient receptacle for sundry articles of value dexterously slipped within its folds by two or three female pickpockets, who were active in their depredations amongst the foot-passengers, but were captured together with their respectable-looking accomplice.

But such petty attempts at fraud are far eclipsed both in audacity and ingenuity by the swindling transaction revealed some little time ago in Italy, and which might well deceive the sharpest tradesmen. The method of its proceeding is not without interest. A gentlemanly looking man accompanied by his daughter, a prepossessing young lady not out of her teens, put up at the chief hotel of the town. They gave themselves out to be English, and among their luggage had four large boxes containing two complete sets of drawers like those used by officers in camp. A salon and two bedrooms, one of which opened into the salon, were chosen by them. When these drawers were unpacked, one set was placed against the door in the salon, and the other on the other side of the door in the gentleman's bed-chamber, the door in question being a very thin one. The gentleman was liberal, and most particular in

paying his hotel expenses weekly. Before he had been long in the town, he paid a visit to the principal jeweller, made some small purchases, paid for them in cash, and let it be seen that he was not short of bank-notes.

Anxious to please his new customer, the jeweller brought out many beautiful articles to tempt him; but at first his purchases were moderate, though liberally paid for. In a few weeks the gentleman came alone, and while making another purchase observed that his daughter was about to be married, and that he thought of sending to Paris for a set of diamonds. On this the jeweller declared that he had the most beautiful set in Europe, the property of a Princess, which he was sure only a 'Milord Inglese' could buy, and begged his customer just to inspect them. The inspection was made, but no decision arrived at that day. Another inspection followed on the next day, and Milord agreed to take them, the price being four hundred thousand francs. The delighted jeweller thought it would be best if he should send them round that evening, but the straightforward answer was: 'I do not keep so much money about me; I must draw upon my bankers in London.'

About a week after, he was requested to call one morning at eleven, and bring the diamonds, for which he would be paid. The jeweller was punctual, and found his customer in his dressing-gown sitting alone at the set of drawers referred to, a front flap of which turned down so as to form a writing-table. Advancing respectfully, the jeweller laid the casket open on the flap in question. Merely examining the gems, Milord remarked that of course he did not wish his daughter to know anything of the transaction at present, and then proceeded to take out a bundle of beautiful crisp notes. The door at that moment opened, and in bounded the young lady in question graceful as a young fawn. Nothing was more natural than that Milord should close up the flap of the desk and ask the young lady to go away, as he wished to be alone. But she was a wilful young lady, and would have her own way. She had come to tell 'papa' that the tailor was waiting for him in the next room, and he must go, and she was quite sure that the jeweller would like her company better than his; besides she had a locket she could not open, and the jeweller must help her. The jeweller was not proof against the playful charms of the young lady; his goods were safe, as he thought, so he begged her father to go and he would wait. Milord left the room, and the poor dupe enjoyed half an hour of delightful flirtation with the young lady.

She was very winning; the time passed like a dream, till at last the lady herself passed away, and hurried to join her father. The jeweller sat in meditation, his thoughts engrossed with the young bride who had just left. Then he began to wonder how long his customer would be, and

presently tried the flap of the drawer. It was 'all right;' it was locked. So he sat down and mused again. When an hour or so had elapsed, he began to think that he must have been forgotten, so he rang for the waiter, and was told that Milord and the Signorina had gone out a considerable time ago. After another long interval he consulted the landlord, but was assured that his guest was a perfect gentleman, whose only fault was forgetfulness. Hours passed; and at early morning the landlord again returned, beginning now to grow suspicious himself. The jeweller became furious, made a dash at the drawers, and with the aid of a poker broke open the flap and made an attempt to take the casket. He thrust his head into the compartment, and sank back into his arm-chair. He saw nothing before him but a square open void, that had been cut out of the door, and which led into the set of drawers in the next room. The landlord had a look, and so had the waiters. They then sat and looked at each other, and at last ordered restoratives for the jeweller, who had fainted.

Thefts by means of any kind of ruse are bad enough, but when they are committed under the cloak of religion they are immeasurably worse. A Sister of Charity called on a family in Paris to enlist their sympathies for the poor; she was most pleasant and attractive in her manner. Eventually she induced those present to join with her in an act of devotion, and the party knelt side by side in the drawing-room while the Sister offered a prayer. From the time of her entering the house and during this act she had kept her hands crossed upon her bosom. When therefore, in the middle of the prayer a lady felt somebody's hand in her pocket, it required some nerve to seize the Sister and accuse her of the theft. This she nevertheless did; and then the mystery was revealed. The crossed arms were of wax and being partially hidden under the sleeves, seemed real, while the actual hands were at liberty to enable the lady to perform her fraudulent calling.

The FFI Sikes fraternity in following out their profession of house-breaking sometimes give evidence of an amount of ingenuity worthy of a better cause. A burglar concealed under the bed of a married couple, by some incautious movement almost betrayed his presence, the noise he made being sufficient to make the wife call her husband's attention to the sound. 'It's only one of the dogs,' was the sleepy answer, and snapping his fingers, he called by its name one of his favourites which was supposed to be present. The thief's presence of mind did not desert him though on the brink of discovery; for divining the situation at once, he immediately licked the extended hand, in the hope of confirming the gentleman's surmise. This clever ruse was not however, we believe, successful, though one might say it deserved to be for its boldness and ingenuity.

When Moore Carew, the 'king of the beggars,' among his numberless impostures had a well peppered raw beefsteak placed round his leg to simulate disease, he only used one of many clever dodges to impose on the charitable. Fever has been imitated by swallowing tobacco, the tongue whitened by chalk, and the cheeks heated by rubbing. The appearance of ulcers is obtained by gluing a bit of spleen or the skin of a frog to the parts supposed to be affected, and keeping them

moist with blood and water. They are created by the use of corrosives, and their healing prevented by the application of irritants. An obstinate sore limb has before now been cured by locking it up in a box. Pricking the gums to shew actual spitting of blood, eating roughly-powdered glass to produce internal hæmorrhage, making soap-pills for epileptic frothing at the mouth, feigning insanity, and lying rigid to simulate catalepsy, are all tricks familiar to prison officials. Even doctors may sometimes be deceived by impostors who display so much ingenuity in the art of deception. Those who gorge shell-fish for the sake of getting nettle-rash, who put lime in their eyes to inflame them, and even thrust a needle down to the lens of the eye to get a cataract, furnish a few of the forms of imposition resorted to at times either to evade punishment or escape military service. Such deceptions are known to have been kept up through fearful ordeals of torture with an obstinate firmness worthy of a better cause. Much ingenuity has been shewn by prisoners in communicating with each other despite all the vigilance of the prison authorities. Notes have been passed about in a mysterious manner that has quite baffled every precaution, and communication has been carried on among prisoners by opening and shutting the mouth as if in speaking, yet allowing no sound to escape; a system of silent conversation that is well understood among them.

The methods resorted to for evading the law are very numerous, and the devices of smugglers for concealing contraband articles are sometimes specially ingenious. One of the most amusing of these attempts to defraud the revenue was exposed by some vigilant French authorities. The heavy duties on spirits made the smuggling sisterhood (most of the smuggling nowadays is by women) doubly eager to bring into Paris an extra quantity of the precious liquors, and this they accomplished in an ingenious manner—namely by wearing full-bodied zinc corsets which could easily contain four or five gallons of brandy. For a time the trick succeeded admirably; but at length the officers began to be suspicious of the unusual embonpoint, which contrasted oddly in some of the ladies with their inadequate necks and faces; so a staff of female searchers was enrolled, and the cheat discovered.

A daring and ingenious plan to evade the obnoxious stamp-duty on newspapers was lately alluded to by a well-known literary gentleman in relating some of his experiences. An unstamped newspaper called the *Weekly Despatch* was published, and to escape the vigilance of the police, a clever device was hit upon, which was entirely successful in baffling the efforts of the authorities. The *Magpie and Stump* in Drury Lane was at the time one of the most mysterious places in London. It was full of nooks and crannies, passages and staircases, all leading various ways in the most puzzling manner, so that one could leave the house in half-a-dozen different directions. By a skilful plan of organisation the papers were despatched from this house packed up in coffins, and while they had boys with mock-parcels to throw the police off the scent, the newspapers left the house with perfect impunity.

It is not long since unhappy little poodles were systematically employed in smuggling foreign

lace into this country, by being passed to and fro across the Channel with two curly coats upon their backs and a layer of the fragile commodity between them. More recently, pigeons have been employed for the purpose of diverting attention from consignments of tobacco, over which sat the innocent-looking birds, while the Custom-house officers were in quest of contraband goods, concealed in the double-bottomed boxes in which the pigeons came over from the continent. Quite lately have the services of these birds been required in carrying out smuggling operations on rather an extensive scale. An enterprising proprietor of about eighty of them was charged, we believe in one of the French frontier towns, with having repeatedly evaded the duty on imported tobacco by flying them across the boundary each with a packet of the weed, varying in weight from a third to half an ounce, tied carefully on its body. This practice might have continued for some time but for an accident to one of the birds, which brought it toppling down with its burden into the hands of somebody, who drew the attention of the authorities to this novel mode of smuggling.

Seldom do we hear an instance of so successful an imposture in evading the sentence of the law as was revealed at the Wiltshire assizes. A man apprehended for stealing a mare was lodged in Malmesbury lock-up previous to his transmission to the assizes. When the police visited his cell next morning they found him lying on the floor unable to move. His statement was that he had got up to look out of the window, and that he had fallen backwards across the corner of the bedstead and injured his spine. Medical aid was obtained, and his sad condition duly commiserated. He appeared to be almost irretrievably injured, and in the greatest agony; and as it would have been extreme cruelty to remove a man in his condition, he accordingly remained at Malmesbury for nine weeks. During this time, everything which humanity could suggest to mitigate his sufferings was resorted to, and his comfort was studied in every particular. At the end of nine weeks he was removed with great care to the infirmary in Devizes, where two men were appointed to attend him, the medical officer there being likewise of the opinion that the poor fellow's spine was seriously injured. In this pitiable state he was brought before the judge, a murmur of sympathy running through the court as they beheld the pallet with the injured man lying helplessly upon it. 'It is a dreadful thing to pass sentence upon a man in such a state,' said the judge. 'The infliction you are suffering under surpasses any punishment I can give you.' Had the culprit been in ordinary health he would have had penal servitude, for it was not his first act of felony; but the judge pitying his condition, sentenced him, amidst a breathless silence, to twelve months' imprisonment; and the pallet with its occupant was carried away.

But now came the sequel. To prove a former conviction, the deputy-governor of Gloucester Jail had been summoned to Devizes; and on going over the jail, a close inspection enabled him to recognise in the culprit an old 'invalid' with whom he formerly had to deal. 'What! at your old game?' exclaimed the deputy-governor, scanning the prisoner's countenance. 'That fellow is an impostor. There is no more the matter

with his spine than there is with mine.' This was thought to be impossible; and several doctors put the invalid through a severe examination; but he protested that his injuries were real, and seemed unable to move. To put the matter to a further test, a galvanic battery was introduced, and shocks were turned on pretty strong, but without the expected results. The doctors went away; but the suspected impostor was threatened with severer tests on the morrow if he was not found sitting up when visited. On the next day, as he was still found in the same position, the electric machine was again set to work, and so sharp was the effect, that the leg which appeared most affected by the spinal injury began to move, until at last, unable to stand the shocks any longer, the fellow jumped out of bed, and in a few minutes afterwards was walking across the court-yard as agile on his limbs as any other prisoner!

YOUNG LORD PENRITH.

CHAPTER XXXII.—THE PENZANCE COACH.

MISFORTUNE, like a gale of wind, acts very differently upon different natures. There are trees that bend, and trees that break beneath the violence of the storm; and as it is with the higher forms of vegetable life, so it is with men. There are light shallow temperaments that yield to the crush of adversity like *feu-reeds* and bulrushes to the tempest, but that spring up, not a whit the worse, when the danger has passed by. There are other and sturdier dispositions that creak and groan, like obstinate oaks, and throb in every fibre, until perhaps they go down with a great ruin. And, again, there are those that fight so long as resistance serves, then bow to the inevitable, and presently assert their elastic life by rising, bruised but not killed, to tower aloft as of yore.

Hugh Ashton, as he walked rapidly along the muddy road that led—whither he knew not, and cared not, for the moment—could only half realise the weight of the heavy stroke that Fate had dealt him. The blow had been unexpected, and it had left its bitter smart. The kind hand that had led him to Cornwall and Treport had suddenly become estranged and hostile, and had thrust him out again to do as best he might in the eternal battle of life. To earn his bread was, in truth, no very dire necessity for Hugh Ashton. It was not as when some timid girl, some inexperienced stripling, is thrown on his or her own resources, to swim, as it were, without swimming-belt or life-buoy, in that great sea of struggling humanity where to sink is to starve. But Hugh had a double purpose, even if he forgot the high-born girl who had so entwined herself with his very heart-strings. He must live, and though he had, even after his bounty to Jan the fisherman, nearly a hundred and eighty pounds in his pocket, he must live by work. And then he had an object in view that was in his eyes sacred.

What was he, the late commander of the *Western Maid*, to do? His most natural course would have been to take to the sea, and to seek, and probably after some seeking find, a place as officer on board some Australian liner, or clipper in the China trade. He was precisely what a

prudent skipper, knowing the little world of a ship, and what squalls and mutinies and headwinds mean, would wish his mate to be. But to go to sea was to leave England, to take again to a roving and a restless life, and to renounce the active prosecution of the search to which he found himself committed, as the Knights of the Round Table were bound to pursue the quest of the Holy Grail. His great desire, when first, after his mother's death, he came over to England with his father, had always been to obtain certain proofs, most valuable, most hard to discover. Hitherto, he had been able to do little or nothing to effect the object to which he had professed such entire devotion; but, now he should have leisure, he trusted to be more earnest in the task that lay before him.

'Perhaps,' Hugh muttered to himself, as he strode on—'perhaps it is all for the best. New ties and new duties are done with and broken—love itself is hopelessly left behind me—and it may be better so. In yonder little Cornish seaport I should have had small prospect of finding any better clue to the hard riddle which has perplexed me so long, than could be afforded by the flitting visits of that female Will-o'-the-Wisp, Ghost Nan. And for one gipsy I shall meet on this side of Tamar, or for that matter, of Poole Harbour, I shall find ten nearer to London. London! There is nothing like the great city with its vague possibilities and shadowy futures. London should surely be the goal of all such aimless wanderers as myself.'

'Hi, hi, young chap!' cried out a cheery voice, somewhat hoarse from a protracted course of rough weather and alcoholic stimulants, and which mingled not inharmoniously with the clatter of wheels and the clash of horse-hoofs. 'Hi, there!'

Hugh glanced over his shoulder, and stepped aside to let the Penzance coach, as it came rattling up, pass by. The good-humoured coachman who drove it, getting a better look at Hugh than he had had before, jerked up his elbow in professional style.

'Going down the road, sir, our way! Just in time to catch the up-train, if you are,' he said, pulling up the four horses with no apparent effort; and Hugh, who in his present frame of mind found the invitation irresistible, sprang to the roof of the coach with a sailor's activity, and the four horses were gathered up and set in motion again.

The coachman looked inquisitively round at his young passenger. The box-seat was occupied by a heavy bucolical person, who thought very much of sheep, bullocks, and oil-cake, but of horses very little, and on miscellaneous topics not at all; so that the coachman found the journey, unenlivened by eleemosynary ale or congenial conversation, a dull one. Hugh's appearance puzzled him somewhat. The young ex-captain wore his plainest clothes, and had a stick and a bundle, exactly like any common sailor 'ashore and atramp,' as the coachman worded it; but he did not look, to the coachman's experienced eye, like Jack of the fore-castle, even when Jack is at his best. 'Left your yacht, sir, somewheres?' asked the coachman politely. He had been a nobleman's coachman before he became the chariotteer of the public, and he prided himself, like

many of his class, on his unerring recognition of a gentleman. Hugh Ashton, mud-bespattered, and with a stick and bundle, seemed to him to be, somehow, a gentleman.

'I have left my ship—no yacht though—as you say,' answered Hugh, smiling in spite of his sadness.

'Ah, well!' said the coachman meditatively, 'there's a good many, now, of you young ones, that turns their hands—swells, mind ye—to all sorts of things. And as well take to the sea as take to the tea!'

Hugh laughed good-humouredly, less at the driver's sally than at the pertinacious curiosity of the man. 'I, at anyrate, have turned my hand to more trades than one,' he said, forcing himself to be cheerful. 'Among others, I drove the Geelong coach over in Australia there, beneath a burning sun, one Christmas-time, and warm work it was.'

'Hot weather at Christmas, eh?' returned the loquacious coachman. 'Well, I've heard of that before, seeing I've a brother of my own on the underneath side of the world. Perhaps you've known him, sir? Name of Mathews, John Mathews.'

Hugh explained that Australia was rather a large place, and that people were less likely to come in contact with one another there than in the crowded mother-country. And then he had to reply to questions as to the wonders of Topsy-turvyland, as the driver called it, its duck-billed quadrupeds and black swans, its cherries with their stones worn conveniently outside, its scentless flowers and songless birds, its kangaroos, nuggets, and other natural productions of the unique Australasian world; at the mention of which, the corpulent agriculturist on the box-seat gave a grunt of contented incredulity, and murmured something, manifestly very much to his personal satisfaction, about 'traveller's tales.'

Chatting thus, the milestones seemed to succeed one another with reasonable promptitude; and presently the houses, that had hitherto been sparsely scattered, began to line the road, and a town came in sight, and a railway, the thin black telegraph-wires and white posts standing out in bold relief against the wintry sky.

'Here we are,' said the driver, tossing down his reins as the coach drew up to the station door; 'and, as I said, just in time.'

Hugh took his second-class ticket, as befitted a traveller of his modest pretensions; and the up-train, flashing like a meteor through the country, whirled him off Londonwards. On the tireless wings of the enslaved geni, Steam, he was borne along, past mine and waste, past croft and garden; now traversing some billowy moor, on whose rugged and heathery surface one rolling table-land seemed to succeed to another, while great gray rocks reared their defiant heads like so many towers built by Cyclopean masons of old; and anon running through the midst of moist green pastures, where sleek red cattle, that by their long horns and their colour might have been of the original British breed, huddled shyly together to low forth deep-toned expressions of distrust as the fiery dragon, with rush and roar, flashed by.

•Then a change came in the domestic architecture, visible to voyagers by the iron road. No

more stone houses, no more slates, met the eye, but red roofs and brick gables peeping out from lane and hedgerow and orchard. No more smelting-works, with heaps of glassy clinkers piled in dismal profusion outside, and foul black smoke rising in clouds to darken the ambient air. Here and there a limekiln; here and there a malthouse or a brewery, seemed the only signs of anything like manufacturing industry; and the only machinery to be heard or seen was the complaining windlass that made the heavy water-bucket come slowly up some deep old well, or the whirring steam-flail that sent up showers of feathery chaff in some farm-yard, as it thrashed the golden wheat or brown barley from the straw.

That is blue wood-smoke that rises in thin, ghostly wreaths above yonder cottage-home, ivied until the dull red of the bricks can hardly be seen through the dusky greenery of the parasitic plant that clings so lovingly to the short massive chimney where swallows build their nests in the pleasant summer-time. How small, if picturesque, are the lozenge panes of those casements that let in so little light, shine the sun never so brightly. The hoary apple-trees so near to the little house are all entwined with white-berried mistletoe, and the thick hedge must in May be glorious with hawthorn bloom and honeysuckle. To all appearance, the indwellers there are utterly unaffected by anything that has been done for the last few centuries. Progress has spared their little Sleepy Hollow. Steam flits past them, but that is all; and all the wonders of modern industry and invention are, to them, living much as their forefathers lived before the Wars of the Roses, as if they had never been.

We are out of the pure, slumberous, old-world country now, and among the interminable suburbs that girdle in London as the pavilions and gardens of the Andalusian Vega girdled in old Moorish Granada. And this is London at last, with its canopy of fog and smoke, and its glow and glare of light breaking through the thick atmosphere, and the low, deep, mysterious roar that never seems to cease, until the hours of toil and pastime give place to the more solemn time for that temporary death which we call sleep.

'*Shadwick's Inn*, Shadwick Place! Where may that be, sir?' asked the cabman whom Hugh engaged, and whose experience of London was for once at fault.

'Drive to St Lawrence's Lane—you know that, I suppose,' answered Hugh; 'and any one thereabouts will tell you where to find the place I speak of.'

CHAPTER XXXIII.—THE OLD INN.

The inn to which Hugh Ashton chose to drive was hard to find, and, when found, not very easy of access. Shadwick Place, situated in the purlieus of the long and straggling Lane dedicated to St Lawrence, in the City of London, has, at first sight, an inhospitable aspect. Not only are the words 'No Thoroughfare' conspicuously painted on a corner house; but there are rusty iron chains which span the grass-grown apology for a street, and that effectually prevent cart or carriage from intruding on the sacred territory. It is necessary for intending patrons of *Shadwick's Inn* to alight and go on foot up to its darkling doorway. The

house of entertainment in question was the very antithesis of one of those crowded and noisy caravanserais that boast of their many hundred bedrooms, their lifts, baths, and palatial dining-halls. There was no bustle at *Shadwick's*, which meekly called itself an inn, as if to disclaim any rivalry with modern hotels, and which in no way courted publicity.

A queerer, less obtrusive hostelry than *Shadwick's* could not have been found even in the City, where quaint old inns not seldom drag on a secluded and humble existence. On the lamp above the door might be traced, in attenuated black letters, the words '*Shadwick's Inn*;' but there were no other signs of its status; and, indeed, the old house, with its dingy blinds and its closed door, seemed to affect a private air, and to deplore the meagre official announcement, in compliance with law and the dictates of a harsh excise, over the porch, to the effect that somebody was licensed to sell wines, spirits, and tobacco.

There was no touting, just as there were no advertisements, on behalf of *Shadwick's*. The odd little inn appeared rather to repel than to attract custom. When a guest of more than common resolution insisted on effecting an entry, he was tolerated, but not welcomed. It might have been supposed that *Shadwick*, or his successor, received a fixed annual subsidy, perhaps from the corporation, to entertain travellers gratis, and that he pardonably did what he could to discourage too brisk a demand for accommodation beneath his roof. London hotels, among which we may sweepingly classify inns and coffee-houses, are prone, it is said, to prize the traveller less for what he is than for what he has, and to measure the respectability of a new-comer by the amount of his luggage. Hugh had no luggage, unless a bundle can be dignified by such a term. And voyagers with bundles are expected to put up with very humble, not to say very queer quarters. But Hugh's face and voice and address were so much in his favour that the bundle was condoned, even at *Shadwick's*, and the young man was grudgingly inducted into a bedroom which, if dingy, was conventionally clean, and was made free of that well of gloom, the three-cornered little coffee-room. Hugh Ashton had a reason, of a sentimental character, perhaps, for this apparently capricious selection of a hostelry. He had been at *Shadwick's* before. It was at this old, out-of-the-way, and almost inaccessible inn that his father and himself had put up on landing after their homeward voyage from Australia. George Ashton had known of the place, through some accident, most likely, and had treasured the recollection of it in his memory, precisely as Romeo cherished the remembrance of the Mantuan Apothecary who might be counted on for the supply of poison at a critical moment. 'I wanted to find a place'—Hugh well remembered what his dead father's words had been—'where I should be in London, and yet as far remote from the London I once knew, as if I were in Africa or Greenland; a place, in fact, where no Pall-Mall lounge or gossip of the clubs could possibly come across me. A better hermitage than this, no man could wish for.' And for his father's sake, and because of that strong and viewless chain of which habit and memory forge the links, Hugh had come back to *Shadwick's*.

In his then frame of mind, Hugh might have taken up his abode in much more pretentious establishments without finding any that suited so well with his humour. Shadwick's was a good deal more comfortable, in a smoke-dried and sunless sort of way, than might at first sight have been conjectured. Shrinking strangers from the country wondered that its beds were so clean. The scrubby little waiter and the sad-eyed chambermaids knew their duties. The old clock that ticked so loudly in the triangular coffee-room was right to a minute. The steady fire gave out much heat. The dark old boxes of worm-eaten wood, a sort of gastronomic pews, within the dusky walls of which several generations of Britons had dined, were snug, if ill-ventilated. Steaks were underdone, but succulent; and the same might be said of chops, and of the cut from the joint; while for oyster-sauce, fried whiting, mackerel, and marrow-pudding, Shadwick's owned few equals, and no superior.

The great charm for a man of leisure and of a vivid imagination, in this extraordinary old inn, was the poetry of it. An inn is rarely romantic, and the City of London is a very odd place in which to seek for the spirit of poetry—and yet it may be found. Nowhere else can there be such contrasts, between clamorous eagerness and silent, dull decay, between swarming crowds and empty courts or lanes, as in the commercial kernel of the most populous city in Europe or the world. There was something solemn, and almost touching, in the hush and quiet of Shadwick Place, with the surging roar and hum of the metropolis faintly audible, and ever and anon the striking of a score of simultaneous church clocks, or the deep-toned thunder of the air-shaking bell of St Paul's hard by.

From this old inn, secluded, if ever inn was, from the poms and vanities of the restless world that seethed and surged outside, Hugh Ashton made his way, not to Mr Dicker's place of business, but to Mr Dicker's private residence. So great a man as the railway director and capitalist, he reasoned, would be more likely to be found at that genial season of the year (for it was close upon Christmas, and the young literary lions of the *Daily Astonisher* were sharpening their pens for a new prose carol, in the shape of leading articles wherein mince-pies and morality, orthodoxy and plum-pudding, punch and the cardinal virtues, were most picturesquely to be blended together) at home than at his civic counting-house.

The name and address of Arthur Wadmore Dicker, Esq., had been easily discovered by the help of the obese Postal Directory which decorated a mahogany shelf in the coffee-room of *Shadwick's Inn*. And Hugh Ashton, who had no social scruples to deter him from availing himself of the good offices of whatsoever omnibus, blue, green, yellow, or of that rich magenta which such public stage-carriages occasionally affect, would serve his turn, easily got himself conveyed to the vicinity of the rich man's dwelling. Mr Dicker's town-house was a town-house indeed, what in France would have been known by the style of hotel, and in Italy could not have escaped being dubbed a palace, one of those tremendous stuccoed mansions that domineer over Hyde Park, like so many robber fortresses tamed down to suit the present

law-respecting epoch, and at the stately doors of which bewildered foreign travellers have been known to knock, addressing the disgusted footmen as 'garçon' or 'kellner,' and asking, in continental speech, for rooms, dinner, and hot bath, under the mistaken idea that the 'Grosvenor' or the 'Langham' had been reached at last.

Hugh walked up and down once or twice before he applied his hand to the steel knocker, with anvil to correspond, a pattern of severe simplicity, on Mr Dicker's door. It is not always without some excusable hesitation that a poor man ventures to pay Dives, in the midst of his purple and fine linen, the compliment of a call.

A magnate's surroundings are often by far more formidable or imposing than the magnate himself; just as a Lord Mayor, divested of his pomp and state, his robes and jewel, his javelin-men, sword-bearer, chaplain, gilt coach, and men in armour, might be mistaken for any undistinguished citizen with an umbrella. Hugh, however, grew vexed with himself for his own diffidence, and brought the steel knocker into close contact with the steel anvil.

Mr Dicker's powdered lackeys and Mr Dicker's apoplectic hall porter did not receive Hugh with any enthusiasm. They were evidently of opinion that 'the young seafaring party,' as they afterwards described him over their beer in the servants' hall, had committed a grave offence in knocking where he should have rung. But they forgave him, in consideration of his youth and air of manly confidence, and told him, languidly, that Mr Dicker was in the City, and would not leave the City until four o'clock, 'or perhaps five;' a piece of information that was imparted regretfully, so it seemed, and with a sort of pity for the unfortunate master of the fine house, and who probably worked a great deal harder than any servant in his pay. Even Hugh could see a certain incongruity between Mr Dicker's palatial mansion, with its liveried loungers in the marbled entrance-hall, its innumerable plate-glass windows, and the hammer-clothed carriage at the door, with the wiggid coachman dozing on the box, and the superb bays clattering their silver harness, and tossing their handsome heads, and the feverish flurry and care of Mr Dicker's own existence.

Hugh turned his back on fashionable London, and went eastwards again among the narrowing streets which even the Great Fire failed to widen, and the thickening swarms of business men, from the merchant-prince to the messenger fresh from his bracket, that jostled one another where once the Wild Prince, with overgrown Sir John rolling along at his side, and all the ruffianly swash-bucklers, Nym, Bardolph, Pistol, and the rest, swaggering at his heels, received the salutations of flat-capped prentices and smug citizens of Cheape. Arrived at Guildhall Chambers, Hugh sent in his name. 'You'll have to wait a goodish time, young man!' said the clerk whose stool was the nearest to the open door of the waiting-room. 'There's plenty before you, you see.' And indeed there were a good many suitors for the advantage of an interview with the great Mr Dicker. A cabinet minister, or the editor-in-chief of the *Jupiter* newspaper, is not more besieged and beset than are those gold-compelling sons of Fortune who are reputed to be always lucky in their dealings, and who can cull the auriferous rose of

commerce without pricking their deft fingers with the thorns that guard it. However, Hugh had not so long to wait as the sympathetic clerk had predicted.

'Mr Dicker will see you now, sir,' said a messenger, bustling up; and once more was Hugh ushered into the capitalist's presence.

THE UTILISATION OF SUN-POWER.

To us in England who possess practically unlimited stores of fuel, and who on the other hand are supplied with provokingly short rations of sunshine, the utilisation of solar heat has never occupied the attention the subject deserves. We therefore have little hesitation in bringing under our readers' notice one of the many curious machines that were shewn at the Paris Exhibition—a model of the Solar Heat Engine invented by M. Mouchot. The model was adapted merely for the purposes of cookery, and on fine days operated in that important but somewhat limited sphere of usefulness. The original engine—of which we propose to speak in connection with the researches of Captain John Ericsson, and the still more recent experiments of Mr William Adams in the same direction—develops one-half horse-power by the sole energy of the sun's heat, which is collected and concentrated by means of flat reflectors.

The Mouchot engine consists of a gigantic lamp-shade some nine feet wide at the open end, which is turned continually towards the sun by an automatic clock-work movement. The interior of this cone is formed of silvered glass, and the sides being at an angle of forty-five degrees with the axis, the solar rays are of course reflected towards that axis at full right angles. A cylindrical copper boiler is placed within this conical reflector, and occupies the same relative position to it as does the chimney of an Argand gas-burner to the lamp-shade around it. The boiler is annular in shape, being formed of an inner and outer envelope of copper two inches apart except at the bell-shaped top, where a space of eleven inches forms a steam dome. The surface of the boiler is blackened with a dead black, in order to increase its absorptive power; whilst the wasteful effects of radiation and of convection of heat by air-currents are guarded against by the interposition of a glass envelope between the boiler and the reflector. This glass serves two purposes: it cuts off the exit of all heat-rays, to the entrance of which it presents no bar; and it incloses a two-inch thick cushion of air, which serves admirably as a non-conducting jacketing to the boiler. Steam-pipes, safety-valve, and all the usual adjuncts of a steam-boiler, complete the arrangement of M. Mouchot's Solar Engine, which is capable of furnishing a half horse-power to any pump, steam-engine, or agricultural machine to which it may be connected, or else the equivalent of that power in heat to any distillery, brewery, or as at the Paris Exhibition, in the operations of cookery.

Improvements in matter of detail may doubtless be looked for in this machine, which recommends itself by reason of the comparative compactness of its arrangement. In the proportions of the boiler and in the inclination of the mirrors, experience may suggest improvement. As a matter of fact, it was found that the mirrors in use in the earlier experiments were too thin to reflect perfectly the whole of the incident rays. Nevertheless it is evident that the capacity of the machine is strictly limited by the size of the cone, which can hardly be magnified to any great extent without a disproportionate cost in giving to it sufficient strength. This aspect of the question seems to have struck Mr William Adams of Bombay, who has recently published a pamphlet on the subject detailing his experiments. He is very sanguine as to the possibility of utilising sun-power in India, not to replace the use of ordinary means, but as an auxiliary during the dry season. It is at this time of the year that many grinning-mills are alone in action, and he calculates that a general saving of twenty-five per cent. in the cost of fuel might be effected in India by the judicious application of solar heat.

Mr Adams had possessed himself of a vertical copper boiler of the Mouchot description, when he abandoned the system of the conical reflector in favour of a number of mirrors formed of flat plates of silvered glass. Seven of these mirrors gave a reflecting surface of one hundred and fifty feet, and in an hour evaporated over one thousand cubic inches of water. This does not represent the actual power, however; for the boiler, being but sixteen inches wide, and the focus of the mirrors being twenty-four inches wide, at least one-third of the effective heat must have been dissipated. Even with this unsuitable boiler, the experiments were very remarkable, and are noteworthy as being made upon the very scene of future promise of practical success. With twelve gallons of water in the boiler, and with the foci of sixteen mirrors turned upon it at 7.30 A.M., there was a pressure of ten pounds effective at eight o'clock; and at 8.30 the steam blew off at the safety-valve at seventy pounds. On the next occasion, at 7.30 A.M. the steam rose to fifty-five pounds effective pressure at 8.30, at which time steam was turned on to a two-and-a-half horse-power pump, which it kept in action at a pressure of thirty pounds. To shew the possibility of utilising the heat in the operations of distilling and cookery, the steam at sixty pounds was turned into a twenty-gallon cask of water, but without producing ebullition. Disconnected and again raised to fifty pounds pressure, the steam when again turned into the cask produced continuous ebullition, so that thirty-two gallons of water were kept boiling by the sole agency of the sun's rays; a circumstance characterised by Mr Adams as wholly unprecedented. He adds that there is no mechanical difficulty in keeping the foci on the boiler from sunrise to sunset.

Mr Adams proposes merely to supplement existing steam arrangements in India by this auxiliary power. In private houses however, for cookery, for the production of ice, and for driving punkahs, there would seem to be an exceptionally clear field for this invention. There is something fascinatingly ingenious in the idea of turning the exuber-

rance of Sol's power to two such opposite purposes as the production of heat for the kitchen and of ice for the dining-room. We must turn now however, to the more comprehensive dreams of Captain Ericsson concerning the future employment of solar heat.

Captain Ericsson is well known as an ingenious and indefatigable investigator of the phenomena of radiation, for examining which he has devised many curious machines. The Solar Engine devised by him was presented to the French Academy of Sciences, and was so constructed as to serve as a meter of the solar energy, and as an example of an engine that could supply motion *without the aid of steam*; the motion to proceed from the direct action of the sun only! The theoretical results obtained by this instrument, as also by a long series of careful experiments in other directions, coincide very remarkably with the practical outcome of the researches of Messrs Mouchot and Adams. Mouchot's one-half horse-power was obtained from about fifty feet of reflecting surface; Adams' two and a half horse-power from an efficient surface of about two hundred and thirty feet; whilst Captain Ericsson estimates on other grounds that one hundred square feet of reflectors afford an efficient energy of one horse-power. It will thus be seen that the proportions are in each of these cases almost identical. The theoretical reasoning is as follows: The solar energy during nine hours a day between the latitudes of forty-five degrees north and south of the equator averages fully three and a half units of heat per square foot per minute, equivalent to a theoretical dynamic energy of two thousand seven hundred and two foot-pounds. Upon a space of ten feet square this energy will be two hundred and seventy thousand two hundred foot-pounds; and this divided by thirty-three thousand, the standard of one horse-power, gives a result of over eight horse-power. It is well known to engineers however, that the theoretical power of heat is never practically educed by even the most perfect of machines, and Captain Ericsson therefore fixes one horse-power as the practical equivalent of each hundred square feet (equal to ten feet square) of reflecting surface. This estimate, as we before remarked, agrees very closely with the results obtained by Messrs Mouchot and Adams.

With such an untapped and inexhaustible supply of power at command as this estimate of solar heat implies, it would seem that the world need never fear the exhaustion of existent coal-fields. There are vast regions of the earth exposed to the blaze of a tropical sun, uninhabited by man, and seemingly destined to be for ever desert. When the necessity shall arise however, these inhospitable regions may very possibly become the grand purveyors of power to the world at large, on a scale much more vast than are at present the coal-fields of England. The New World, Lower California, the table-lands of Mexico, and the west coast of South America present regions sufficient to furnish power almost impossible to calculate or conceive. Captain Ericsson, in dealing with this aspect of the subject, takes a strip of territory eight thousand miles long by only one mile in breadth, taking portions from all parts of the regions we have named. His calculation, which is very simple, but into which we need not enter, gives the astounding result

that this sample of the world's desert lands is capable of furnishing motive-power for over twenty-two million steam-engines, each of one hundred horse-power, for nine hours per day.

THE SCOTTISH BANKER'S DILEMMA.

IN TWO CHAPTERS.—CHAPTER II.

DISMAY fell on the quiet little bank in Tollkirk. The former uneasiness became in the office a panic. Hamilton had been made ill by the anxiety of his position, and was in bed on the day that Mr Traill's deficiency occurred. After closely scrutinising every entry in the books, Traill came to the conclusion that he had not paid the money in excess to any one, and that the notes must have been stolen by some one on the premises. The bank's safe was duly examined; but the locks bore no marks of being tampered with. The windows and doors of the office were unaffected; and Mr Duff's domestics—who swept out the office—had been his servants and were known to him for years. The matter was on this occasion reported to the bank's head office; but thence came the cold intimation that no further deficiency could be made good, and referring the bank agents to their recent letter to that effect of such and such a date.

Mr Duff began to think the place was haunted. Wherever the money was gone, it had to be paid up; raising the total losses made in this mysterious way to the unpalatable sum of fourteen hundred pounds in less than three months. The mystery was all the deeper that during the day of the difference in Traill's cash it had happened there had not been a single cash payment amounting to five hundred pounds. Then there came vague rumours—such as the police, had the matter passed into their hands, would certainly have made use of—that there was an itinerant locksmith, a gipsy, in the neighbourhood to whom popular rumour attributed almost miraculous power in the manipulation of locks. Yet it would take a very clever locksmith indeed to open the Central Bank's safe unheard in the house, and to close it again without leaving traces of his work. The safe had a foundation of eight feet of stone, and was coated on the floor, wall, and roof with a two-inch plate of solid iron. The doors were of course of iron, and each—there were four doors—had two keys and separate locks. Through the lock of the outer iron door an iron bolt was each evening shot down from Mr Duff's bedroom above, and while that bolt was down, no key in the world could open the door. It was necessary to be in Mr Duff's bedroom before the bolt could be drawn or dropped. It was extremely improbable that there were any in Tollkirk who could, even with the necessary keys in their hands, find their way into the strong-room unaided.

No longer was Mr Duff able to leave the bank with an easy mind for a two-o'clock luncheon—with forty winks to follow—as had been his custom these twenty years. He was closely on the watch. Yet there was no visible cause for suspicion. Bankers and clerks were fast becoming demoralised—in the military sense—from sheer fright, accelerated by mystery, and a sense of utter helplessness in face of it. Mr Duff might far better be losing his fortune on the Stock Exchange, or throwing his

money away on turf speculations ; in these there would be some remote chance of profit, if not satisfaction in losing his property. His bark had up to this time sailed in smooth seas, had even, hitherto, floated in a sheltered bay, unexposed to financial tempests or breakers ; but now a leak of a dangerous sort had sprung, as likely, he imagined, to engulf him at his anchorage as any buffeting of waves in open sea.

Mr Duff became a changed man. He was thin and worn and ill with anxiety and watching. They were all watching. Traill was watching Hamilton ; Hamilton turned a keen glance on the boys ; the boys kept their eyes very widely open all round. Mr Duff was unwilling to put the matter in the hands of the local police, knowing that the first to be suspected would be his clerks, and that the affair would speedily become town gossip. Secretly Mr Duff began to think the place was bewitched.

His partner, George Traill, being called upon to pay up half of the five hundred pounds, resolved to get to the bottom of the matter. He had a bed fitted up in the banker's business-room, and determined to spend his nights there until some solution of the problem presented itself. His transfer from the Aberdeen branch seemed just then to prove a bad bargain. The keys of the safe, it should be mentioned, numbering eight, were placed every night after the locking up of the safe and the dropping of the iron bolt from the banker's bedroom, in a strong-box, the key of which was always carried by Mr Duff. George Traill, armed with a revolver, in spite of Mary's protests and Mr Duff's jeers, occupied the room when the bed had been fitted there, and waited philosophically the course of events. He slept little for the first night or two ; but no intruder came to disturb his repose. The long dull hours crept on without adventure or other result than to make Traill sleepy and cross during the following days. The bankers were beginning to despair of discovering the thief. Yet Traill—despite Mr Duff's perfectly reasonable argument that if any man broke into the safe it would not be merely five hundred pounds that would satisfy him, nor would he likely risk a second or third visit—continued to spend his nights in the bank.

At daybreak, however, on a certain morning in the following week, Traill, who slept very lightly, was suddenly awakened and startled by hearing the bolt that passed through the lock of the outer door of the safe drawn sharply up. He could hardly believe the evidence of his ears, thinking that perhaps he had dreamed. But the 'click' was still reverberating, exaggerated as all sounds are in the stillness of night. If the bolt was really lifted, the person that drew it up must be in the room where Mr Duff slept. Traill was a courageous man ; but in spite of himself, he trembled as he felt for and examined his revolver. When the reverberation subsided, there was a silence for a few moments as of Death, Sleep's twin brother. Then he thought he heard, far off, a door open, followed by a step on the stairs. Then a light shewed at the seam under the door ; presently the door opened, and a man entered, carrying in one hand a lighted candle, in the other a bunch of keys. The revolver was firmly held in Traill's grip, and before firing, he was about to utter a cry of warning, when he noted that the figure paid

no heed to his presence, but passed him, making straight for the safe-door. In the dim light, to his astonishment, he distinguished the fixed, even rigid features of his friend and partner Mr Duff ! His eyes were wide open, and he moved with his usual deliberation, but with an air of stern preoccupation quite foreign to his working habits. Traill saw at a glance that the banker was walking in his sleep.

His first impulse was to seize him and wake him ; but a moment's reflection decided him to wait the natural issue of events. Mr Duff, without hesitation or fumbling, chose the right keys for the outer door, and pushed it, as the lock sprang back, slowly open ; then the wicket-gate, the inner iron door, and so on, until he disappeared silently in the vault-like shades of the strong-room. When he reached the inner safe, he took from the well-packed store of pound-notes—Traill eagerly watching him from the door—a bundle containing five hundred ; he then noiselessly shut and locked each door as he retreated. He passed within arm's-length of Traill, bearing the bundle of notes, the keys, and his lighted candle ; left the office—followed by his partner—walked slowly up-stairs to his bedroom, where he deliberately dropped the bolt back in its place, and finally laid the keys carefully, apparently counting them, in their usual place in the box fixed in the wall for the purpose. Traill expected he would then retire to bed ; but it was evident that the somnambulist had not finished his night's work. Having safely put away the keys, he lifted his candle and again went down-stairs, carrying the notes in his hand. Traill followed him through the kitchen and out into the courtyard behind. With the same purpose-like deliberation that he had shewn at the safe, he now marched to—the unvarnished truth, O romantic reader, must be recorded—to the PIG-STY ! Arrived there, he lifted a loose fold of thatch that rested on a slab of stone in the rickety roof, secreted the bundle of notes there, replaced the thatch carefully, and then turned with an air of relief and went indoors.

Traill did not disturb him, did not even take the trouble to follow his partner to see if he reached his bed safely, but sprang eagerly to the loose thatch, in which, snugly lying, he found the comfortable sum of one thousand nine hundred pounds in bank-notes ! He could not help laughing as he stood there in the dim gray morning, hardly half-clad, for the pursuit had not been without excitement. 'An expensive roofing for Duff's pigs,' he murmured, gathering the various dusty bundles together and retreating indoors from the cold morning air.

'I think, Duff,' said Traill seriously when they met in the office after breakfast—'I think, to make certain that no thief, or witch, or ghost has been tampering with the cash during the night, we had better count the cash henceforth in the morning as well as at night ; that will make certain whether the money disappears by night or during the day.'

Mr Duff assented.

'Suppose you begin this morning.'

Again Mr Duff assented ; and with reluctant fingers, at his partner's suggestion, counted the money. 'Powers of Darkness !' he exclaimed, 'I

shall not stay another day in this house. The cash is again five hundred pounds short!' Had Mr Duff not been a remarkably bald man, he would have probably torn his hair in agony.

'How much do you reckon your pigs cost you annually, Duff?' Traill asked with apparent irrelevance and, as Mr Duff thought, flippancy.

'Pigs! Hang the pigs! Hang the bank! and— Yes; I mean to resign my office. I'm not going to remain here to be robbed and ruined.'

'I see you are putting a new roof on your sty, and papering it,' Traill went on sententiously. 'Sparing no expense on it. Doing the thing stylishly, eh?'

'Are you mad, Traill?'

'Well, let me see. At the rate of two thousand pounds, say, in three months, that pig-sty will cost you and me just about eight thousand pounds a year.' Traill was apparently in his gravest mood. 'That's pretty moderate, eh?'

'Poor Traill! The loss of his money has taken his brain. What demon has entered this house?' sighed Mr Duff in the presence of a despair more tragic even than his own.

'Look here, old fellow!' said Traill, suddenly bursting into laughter—'look here! I found these in the roof of your pig-sty this morning; and what is more, I saw you put them there with your own hands.'

'Prodigious!'

Yes, all the missing money was there. The banker gave a champagne dinner to his delighted clerks on the evening of that day. His own health, however, was in rather a bad way. In a month or two he resigned his office, retiring on a liberal pension to his farm; and in order to compensate James Hamilton for all his recent trouble and misery, Mr Duff requested, as a personal and final favour, that the Directors might appoint him to the position of Assistant-agent with George Traill; a proposal which the Directors favourably entertained. These offices both of the gentlemen hold with honour to this day. It may be mentioned too that George Traill and James Hamilton are now brothers-in-law, each having in due time wedded one of Mr Duff's daughters. The bank is James Hamilton's home; while George Traill has rented a farm adjoining Mr Duff's. The fresh country air, and exercise, and fishing, and unlimited golfing—all enforced on him by the doctor as the best medicine—have put an end to the old banker's somnambulistic rambles.

NOTES OF A NATURALIST ON BOARD THE CHALLENGER.

To those who are weary of society and its ways, a cruise such as that of Mr Mosely's on board the *Challenger* must appear in the last degree enjoyable. Around him was the freshness of the briny air, for which the denizen of dusty cities pines in vain; superb ocean views stretched on every side; while on shore an ever-changing scene greeted his eye. One day it might be the rich green valleys of Madeira and the refreshing coolness of its pine-woods; and the next the half-tropic glare of the tawny sun-parched Cape de Verdes.

In his *Notes of a Naturalist on Board the Challenger*, Mr Mosely has dwelt more on the instructive than on the amusing or enjoyable side of his

experiences, but he and the crew were not condemned to the all work and no play which is proverbially known to make Jack a dull boy. Sometimes they tempered their scientific pursuits with occasional recreation. A seining-party, for instance, was organised at St Jago; and among the spoil in the seine-net was a large shark fourteen feet long. It struggled hard for life, but was at last hauled up high and dry, and handed over to the tender mercies of the sailors, who never have any pity for a shark. Very wonderful were St Paul's Rocks and Fernando da Noronha. Barren crags in mid-ocean, inhabited by thousands of sea-birds, noddies and boobies, whose storm-swept nests cluster thick on every ledge. Fernando da Noronha has a Brazilian convict settlement, in addition to its numerous bird colonies. The land is fertile; and the wretched inhabitants have round their huts plantations of sugar-cane, maize, cassava, sweet potatoes, bananas, and melons. The fauna and flora are closely allied to those of South America.

Bahia, on the coast of Brazil, much resembles Lisbon; but has an eastern look, which it owes to the bright tropical verdure of its palms and bananas. An excursion was made to a patch of the primeval forest which creeps up to within a short distance of the town. Here they were wandering in the subdued greenish gloom beneath the shadow of lofty trees, when all of a sudden a short stifled shriek ending in a hiss was heard, and the negro guide in a state of great excitement called out: 'Toucan! toucan!' Mr Mosely fired, and hit a large bird with vivid plumage of jet black, bright orange, and brilliant red. This beauty shewed fight even in the last extremity, and in the very act of dying, bit the naturalist's hand severely as he lifted it from the ground. In a small pond close to the town of Caxoeira, in Brazil, is a small variety of the toad, which has a cry like a loud harsh cat's mew. Mounted on mules, the whole party rode twenty-eight miles inland to the Fair of St Anne's. The chief attraction was the cattle-market, which was composed of vast herds of half-wild cattle. These cattle were tended by *vaqueiros*—men of all the intermediate shades of colour between black and white. They wear leather coats, leather breeches, long boots with huge spurs, and high, conical, broad-brimmed leather hats. Slavery still exists in Brazil; but a law is now in force by which every child born in the country is declared free. Slaves are allowed to buy themselves off; and at Caxoeira a very pretty girl came to beg from the English party. 'She was collecting money,' she said, 'to buy her freedom; for her master was very cruel, and beat her every day.'

Tristan da Cunha is one of a group of barren and desolate islands. Despite its terrible climate, it is well wooded with a tree resembling the yew, the *Phyllica arborea*. Formerly, rabbits, goats, and pigs were plentiful; but now they are not to be found, and the cattle imported by the settlers often perish during the winter from the severity of the weather. Inaccessible Island, another of the group, was next visited; and here, to the surprise of every one, two men were descried by aid of the ship's glass standing on the barren shore, and gazing fixedly at the ship. After breakfast, the captain went ashore and brought them off. They were a couple of Germans, who had been

landed two years before from a whaling-ship on this barren inaccessible rock. Their object was to hunt fur-seals; but in this expectation they had been miserably disappointed, and had endured all manner of hardships and privations short of actual famine. They had a hut and a patch of potato-ground, and kept their larder tolerably well supplied with birds and wild-pig. One of them guided a party from the ship to a penguin rookery. It was in a dense sea of tussock-grass higher than a man's head. In this grass thicket the birds nestle and shelter; a lane a yard wide, beaten black and hard, leads through the entire length of the rookery; and from this main street smaller thoroughfares diverge on each hand. 'The stench of this penguin paradise was,' Mr Mosely says, 'overpowering, and the yelling of the birds perfectly terrifying.' The nests were placed so thickly that it was impossible to avoid treading at every step on eggs or young birds; nor were the penguins slow to express their disgust at the clumsy intruder. Our naturalist thus relates his experiences: 'A parent bird sits on each nest, with its sharp beak erect and open ready to bite, yelling savagely "Caa, caa, urr-urr," its red eye gleaming, and its plumes at half-cock quivering with rage. No sooner are your legs within reach, than they are furiously bitten.' Nightingale Island, the smallest of the Tristan group, has a series of caves in the low cliffs along the shore, much frequented by fur-seals. It has also penguin rookeries, through which are scattered the cylindrical nests of the mollymauk, a species of albatross.

At the Cape of Good Hope the wanderers were reminded of home; the hills about the Cape look not unlike Scotch moorland scenery, and are everywhere covered with low bushes without trees. There are no bright greens in the colouring; a brownish neutral hue prevails. During the flowering season, this sombre tint gives way to a brilliant flush of transitory beauty; handsome heaths, splendid pelargoniums, bright-coloured everlastings, shewy gladioli, and stately white arums vie with each other in lending the most vivid and striking effects to the many-hued mosaic. The slopes and mounds of Table Mountain are covered with the wonderful silver tree, whose leaves shine like burnished silver, and impart a splendid lustre to the landscape. Baboons are plentiful among the hills, their warning cries resounding on every side. Partridges, quails, and antelopes abound. The owner of an ostrich-farm which the party from the *Challenger* inspected, told them that a kick from an ostrich was very dangerous, and that the best thing an unarmed man could do when attacked by an ostrich was to lie down flat on the ground, and let the bird walk over him until it was tired. A simple operation no doubt, but one requiring considerable nerve.

Prince Edward Islands and the Crozet Islands, on which they disembarked, were covered with snow. The lower part of Marion Island stretches along the shore with large compact convex masses of a plant called the *Azorella selago*, which is a typical plant of all these southern islands. Grass was mingled with this plant, and patches of the Kerguelen cabbage. The albatross and different species of gulls build their nests among the rank herbage; and in the bare peaty ground there was

a rookery of king-penguins, enormous birds which stand as high as a man's waist. The Crozet Islands are similar to the Prince Edward Islands, and in addition to sea-birds, are stocked with wild pigs and rabbits. Kerguelen's Land, at which they next touched, is the chosen home of mist, rain, and snow. It lies within the belt of rain at all seasons of the year, and as it has no drying winds, it is as completely saturated with moisture as a wet sponge.

The bay in which they landed was a deep narrow inlet with dark frowning cliffs, reported to be full of fur-seals, of which every one was anxious to shoot as many as possible; consequently a rush was made to a small herd of creatures lying on the grass, which were found to be sea-elephants. While the sailors were looking at them, Mr Mosely saw about a hundred yards off, on a little knoll, the head of an animal cautiously raised; it was a fur-seal, which he managed to kill after a good deal of trouble; and that with three others constituted the 'bag' of fur-seals at Christmas Harbour, as the little bay was called. Heard Island, the most northern of the Macdonald group, was next visited. The flora was very poor; but terns, penguins, Cape pigeons, shags and gulls of many species, were plentiful. Six days after leaving Heard Island, the first iceberg was sighted; and soon forty in a day was no unusual spectacle. These great masses of ice, seen on a bright day, with the sun flashing into the caves and crevasses on their surface, were a most beautiful and striking sight. White was the ground colour of the huge blocks, deepening in the cavities into bright azure or intense cobalt blue. Flushed with the brilliant glories of sunset, they warmed into rosy red or bright crimson, passing into shades of deep purple and amber, which faded as evening fell into a cold gray white.

Leaving the southern icefield behind, the *Challenger* steamed into the warm Australian current, and cast anchor off Sandbridge, the seaport suburb of Melbourne. English house-sparrows were disporting themselves on the beach as saucy and confident as if on a London street; but Mr Mosely had not come so far merely to interview English sparrows, so he made an excursion into the Bush. There he shot a splendid paroquet and looked out for opossums; but they, more wary, kept up the gum-trees. He then tried for a lyre-bird; and in scrambling through a dense patch of scrub, almost came plump down upon an astonished kangaroo, which disappeared with a tremendous bound, and left our naturalist, like the father of Lord Ullin's daughter, 'lamenting,' and bereft of that addition to his scientific stores.

In the streets of Wellington, the principal town of New Zealand, tattooed Maoris were to be met at every turn dressed in European costume. The fauna and flora of this island are very different from those of Australia. The general lie of the country recalled to them Kerguelen's Land; but all the valleys and inland slopes are covered with a dense growth of forest and bush.

The Kermadec Islands were passed without landing; and in the gray light of a dull, somewhat chilly morning, the *Challenger* approached the Friendly Islands. A pilot-boat, manned by four sturdy Tongans, came out to meet her. Except a girdle of green screw-pine leaves, they were un-

encumbered by clothing, so that their scientific visitors had no difficulty in perceiving that their colour was a light brownish yellow with a tinge of red. Their hair was most elaborately got up in a mop of small curls, sticking right up from the head, and was coloured a rusty red by means of coral lime. Their houses are small and oblong, and contain no furniture except Pandanus mats; a small sleeping-chamber is partitioned off, and is furnished with a kaava bowl and pillows, not of down, but a species of narrow wooden stool supported on four legs, on which the neck is rested during sleep, in order that the elaborate coiffure of the Tongan dandies may not be disarranged. The women are tall, with fine figures, and are most of them handsome. With the trade-wind the *Challenger*, restless as the Wandering Jew, hastened to Fiji. Mbau, a small island of the group, was one of the principal seats of cannibalism; and Mr Mosely contemplated with shuddering interest the stone against which the heads of the human victims were dashed previous to being cooked in the oven. 'So many heads,' he says, 'have been dashed against this stone, that it has happened that human teeth have fallen into almost all the holes in the slabs, and have become jammed there. The slabs were quite full of them.' Horrible to relate, young women were considered the best eating; and a vegetable, a species of Solanum, was used as a condiment with the baked flesh.

A week's run with the trade-wind brought the *Challenger* to the New Hebrides group, where the natives were found to be a short race, with small, badly shaped limbs. Eleven flowering plants were found on Raine Island; and in a sheltered spot Mr Mosely sowed pumpkin, tomato, capsicum, water-melon, and Cape gooseberry seeds. Birds were the most striking feature of these islands. They were in immense flocks, which literally darkened the air: herons, turnstones, gulls, terns, gannets, and frigate birds. Somerset, Cape York, the northernmost point of Australia, was reached in the beginning of September. The number and variety of birds in the country around seemed surprising. One beauty, a species of the bird of paradise, Mr Mosely considered a great prize, not only on account of the brilliancy of its plumage, but because it is so shy and difficult to shoot. At the entrance of Torres Straits they landed on Booby Island, a bare rock covered with birds. On approaching the Aru Islands, large quantities of leaves, fruits, flowers, and branches floated past them from the shore. They anchored off the town of Dobbo, and were speedily visited by a party of Malay notables arrayed in fine dresses of coloured silk. Sago-palms abound in the swamps, and a species of screw-pine with a fruit as large as a man's head. The trees are so extremely high and large, that Mr Mosely says 'it would take a day to fell one.'

In October the *Challenger* arrived at the Philippine Islands, whose general appearance recalled to Mr Mosely the scenery of India and Ceylon—swampy paddy-fields stretched on every side. One specially interesting fact in regard to the native population is, that all their houses are pile-dwellings. Some of the houses of the Moros, a Mohammedan race, are raised on piles out in the sea, so that they can only be approached

by boats. The Moros are a fierce warlike race. When young, the women are remarkably handsome; they are light-coloured in complexion, and have peculiarly bright eyes. Mound-birds are common. They lay an egg about the size of a hen's egg and bury it in the sand, where they leave it to be hatched by the heat of the sun. In the Philippine Islands the great business of life is cock-fighting. The Chinese shopkeepers generally keep a pet cock tied by a string to a peg outside their doors, and in the intervals of business while away the time by a friendly tussle with a neighbour's bird. At Hong-kong Mr Mosely attended a Chinese dinner-party. The Chinese are very tasteful in flower decorations, and the walls of the room in which the feast was spread were covered with beautiful flowers, arranged on a background of moss. Some of the dainties were peculiar, such as dry dead caterpillars with a fungus growth attached, and eggs pickled and buried for years before being eaten. Women were present at this banquet, but no portion of the good things fell to their share. They sat behind the men, and were supplied with dry melon seeds, which they chewed, cracking them in order to extract the kernels.

After passing the Meangis Islands, the ship steamed into Humboldt Bay, on the New Guinea coast, and was immediately surrounded by natives, whose constant cry was, 'Sigör! sigör!' which means iron. Some of these men had a hole in the septum of the nose, through which was passed a pair of wild-boar's tusks fastened together in the form of a crescent. This extraordinary ornament projected upon each side over their dark cheeks as far as the eyes. Their houses are built on piles three feet above the water, and are connected by bridges.

The Admiralty Islands were sighted on the afternoon of the 5th March; after which came Japan and the Sandwich Islands. Viewed from the sea, all the islands of this group present a remarkably barren appearance. Mr Mosely visited the crater of Kilauea, and looked from the surrounding cliffs into a fiery seething lake of molten rock, which tossed restlessly back and forward, throwing glowing red-hot waves against the bases of the crags.

Tahiti and Juan Fernandez were each visited in turn; then Valparaiso, the Vale of Paradise as it has been called. The party from the *Challenger*, however, found it not much of an Eden, so far as beauty went. Not a tree was to be seen, the Andes were scarcely visible, and the steep hill-sides were covered with a tall candelabra-like cactus. Our naturalist was guided to the top of the Upsellata Pass by a travelling barber, an equestrian hair-cutter, who rode with his scissors dangling from his saddle-peak. The road was rugged and barren in the extreme, and has an unenviable notoriety for highway murders, which are perpetrated by means of the lasso, in the use of which all classes of the population excel. Mr Mosely saw a young girl going to milk cows playfully lasso a young man with whom she had been flirting, by catching him round the neck as neatly as possible just as he was going away.

This brief sketch of the observations made by Mr Mosely during his celebrated voyage, may perhaps suffice to induce our readers to peruse a work full of interest for all who are fond of books

of travel, and especially for those who would desire an acquaintance with the fauna and flora of distant lands. In his company they may survey the glowing tropic beauty of Brazilian forests, or bivouac among sea-elephants on the sunny beach of some landlocked bay, or watch from some cheerless ledge of rock the dizzy coast-line and frowning promontories where the hardy sea-bird nestles and rears its young. If prone to such inquiries, they may speculate upon national character as expressed in the countenance of the sturdy Tongan, the wily Malay, or the dull-eyed native of New Hebrides. They may find in all this variety an infinite charm, travelling round the world, and noting all that is most curious or interesting without travelling beyond their comfortable fireside.

MESS-SCRAPS.

In the days when the sewing-machine was in its earliest infancy, a lady residing in India imported one, and for a long time kept its mysterious working hid from the ken of her native tailor. This functionary was the very slowest of his proverbially slow 'caste,' and wasted no end of time drawling over hem and stitch. One day his mistress comes to him arm-laden with yards upon yards of some dress fabric. 'Dirzee,' says she, 'how long will it take you to run these breadths together?'

'Tree day, Missis,' replies Dirzee. 'Missis please, plenty too much work.'

'Three days? Nonsense! Three hours, you mean. You are a very lazy man, and I'll cut your pay. Give me the stuff; I'll do it myself.' Then the lady retires to her boudoir, from the inmost penetralia of which a sharp and continuous click and whirl reach the tailor's ears. He can't make out what the sound is, and he is much too lazy to speculate on it. He continues to 'chew betel,' and yawningly to ply needle and thread.

After an hour or two, 'Missis' comes back, and throwing at Mr Dirzee's feet the raw material, now fashioned into a completed skirt, says: 'There! See! You wanted three days, you sleepy fellow, to finish this, and I have done it already.'

Astonished, Dirzee turns over the drapery, examines the seams, scrutinises the stitch, and satisfies himself that all is proper and according to tailors' rule. He is confounded. It passes his understanding. There lies the work done and no mistake. But how? He springs up from the mat on which he has been squatting; he kicks over the little brass vessel which holds his drinking-water; he scatters right and left thread, needles, thimble; he stops not to put on his sandals or to adjust loosened turban and waist-cloth. Scared and bewildered, he runs for very life into the bazaar, shouting as he goes along: 'Shitan! shitan! [the Evil one! the Evil one!]' He do tailor business that Mem's house. I listen! I hear! He cry "Cleck, cleck, cleck!" Two hour time he neber stop cry. Den! Plenty too much true dis word I tell. Ebery bit true. All work done finish! I not go back dat bungalow.' And he never did.

The destructiveness of white ants, those pests of the East Indies, is well known: wood, leather,

paper, clothing, anything and everything, if not closely watched or isolated, falls a prey to their insatiable little jaws. Yet it was hardly thought expedient by an examining board of officers to verify the statement of a certain storekeeper who explained a deficit of many scores of copper and iron bolts, rings, locks, and such-like as 'eaten by white ants.' 'Too hard to swallow,' was the marginal note of the president.

In the island of Ceylon a small force of native gunners is maintained to do the drudgery-work of the royal artillery. The men are called Gun Lascars, and except that they are not intrusted with the sole management of the ordnance, are disciplined and dressed precisely the same as the royal artillery; indeed they are the counterfeit presentment of that corps, bar their black faces. A battery of artillery fresh from England was being landed at Colombo, and a few of the Lascars were on the wharf. The European arrivals, unaware of the existence of their copper-coloured 'slaveys,' were anxiously inquiring who and what the 'niggers' in blue and gold were, niggers in uniform, so like themselves.

'Sergeant,' says one man, addressing a veteran, 'who is that 'ere bombardier—him with the Christy-Minstrels'-burnt-cork-face?'

'Him? Why, don't you know him? Tommy Atkins, of the A. battery. Sure, you remember him at Woolwich?'

'Tommy! that Tommy? Why, sergeant, he's black!'

'Of course he's black,' replies the sergeant. 'It's the hot sun as does it all. First it browns, then it reddens, and then—if you stay here long enough—it blackens you, just as you see bread toasting afore the fire. Atkins has been in Colombo more than twelve years; and if you are not in "Bayley's godowns" [Anglic, the graveyard] by that same time, to Tommy's complexion you'll come, and a shade or two blacker perhaps. Write that to your sweetheart by the next overland mail.'

A certain colonial legion now extinct possessed at one time an officer, who would have well passed for own brother to Mrs Malaprop. His knowledge of the meaning of many English and other words and phrases was infinitesimally limited, yet his conversation was always grandiloquent and interspersed with quotations or rather misquotations. The jest-book of the mess teemed with his quaint absurd sayings—some true, some fathered upon him. This one, however, was recorded genuine.

His son became a victim to the tender passion, and while the spooning was at its hottest, S—— 'of ours' meets Malaprop père, and says: 'Old fellow, is it true that son Joe is engaged to Miss Dash? Every one talks so.'

'It matters but little, Captain S——,' replies Malaprop pompously, 'what people talk. There are always so many *cunards* flying about that it is difficult to believe anything. Whatever I hear, I swallow with a dose of salts. Joe is not affianced. Miss Dash has certainly *enamelled* him, completely *enamelled* him. He has put her other *shooters horse di combât*; but no betrothal is yet on the *tapes*. That will come, I suppose, of course; when, I hardly yet know—but *post mortem*, I fancy.'

If the reader will kindly substitute *canard* for the great ship-owner's name, *grain of salt* for dose of salts, *enamoured* for enamelled, *suitors* for shooters, and give the words their usual pronunciation, he will see the force of Malaprop's rejoinder.

At a competition for Sandhurst Military College, there appeared among a host of candidates a young gentleman whom we will call Brass. Cramming had done much for him, but not quite enough; for at the first glance he takes of the examination paper he sees that it is beyond his depth. His heart is heavy; he knows he must be spun; so the happy thought occurs to him of escaping the ordeal with flying colours.

'Sir,' he says to an official perambulating the room to prevent 'cribbing,' 'will you pardon my asking a question anent these papers?'

'Certainly.'

'With what amount of pay per diem does government remunerate a sub-lieutenant of infantry?'

The inquiry is hardly in keeping with the peripatetic's occupation, but he answers it nevertheless, and tells Mr Brass that it is 'five shillings and threepence.'

'Oh,' observes that youth—'five and three—sixty-three pence. Considerate, but trifling;' and he returns to his seat. But presently he is up again, goes to the walking-gentleman, hands him the printed questions, and to use his own expression, 'mizzles.'

Across the returned page he has written: 'Cannot be done at the price in the metropolitan market. Try the provinces.'

There exists in the Indian army a regulation under which colonels after a certain number of years' service become entitled to retire from active duty on a well-earned pension of a good many hundreds of pounds sterling per annum. This allowance, going by the name of 'off- reckonings,' is the ultimatum of an old officer's existence; for this he holds on, braving all the ills that Indian flesh is heir to; and on this he anticipates the reproduction of his curries, pillaus, and chutnies in some quiet well-ordered European bungalow. In the year 187—, there was held in the vicinity of Poonah a large camp of exercise, and all sorts and conditions of troops were mobilised for the occasion. Among the Brigadiers was a colonel of a native infantry regiment, whom seniority rather than capacity had placed in his responsible command; for truth to say, our friend was somewhat in the sere and yellow leaf, inactive, had done the state all the service he ever intended to, and was but biding his time for the coveted off- reckonings. During the manœuvres, the force he led had not been distinguished for its *élan* and dash; on the contrary, the tortoise-like pace of its movements had elicited the ire of the commander-in-chief.

One morning the final attack was ordered, and our Brigadier was instructed to advance his brigade, and crown, at the bayonet's point, a ridge which the supposed enemy held. The eagle eye of the chief sees the aforesaid tortoise-like pace at which the troops, headed by the old colonel on his equally old war-horse, are moving, and off gallops like the wind an aide-de-camp to stir him up. 'General,' he says, 'Sir Charles desires that you

will advance much more rapidly. There is artillery playing on you from the right, and a body of cavalry is ready to attack your left flank. Your men will be cut to pieces. Double up; charge, and secure the hill at once!'

To which the Brigadier replies: 'Captain —, is Sir Charles aware of the nature of the ground between this and that?'—pointing to the high land. 'Does he know that it is covered with large loose stones, cut up with deep ruts, stuck with stumps and roots of trees and shrubs, crossed by a wide nullah [water-course], and in short is almost impassable?'

'Well, sir, what then?' says the aide-de-camp.

'Only this, my dear young friend, and which, please, respectfully convey to the chief. Say, that for thirty odd years I have been grilling in this presidency; that in three months more I come in for my off- reckonings; and that if he, Sir Charles, were as near that Eden, he'd not risk his life and twelve hundred a year over such a break-neck line of country, for all the imaginative enemies from Cape Comorin to Peshawur. Indeed sir, I can't afford to do it.'

A party of some five or six gentlemen were seated one night in the cool veranda of a Singapore bungalow enjoying Manilla cheroots and other Eastern solaces. Among them was a sea-captain of the old school and a major of the then East India Company's Madras army. Local and home topics being exhausted, personal adventures came on the carpet. Says the skipper: 'You chaps of the army are a wild larkly set. Me and my mate came foul of a lot of you once at *Rupée's Hotel*, Madras, what time my craft was laying in those rough surfy roads, fifteen years ago come next sou'-west monsoon. We had all messed together, and I'm afraid had got rather more than three sheets in the wind, had aboard more than we could carry; so out we sails for a spree; and what do you think we does, we seizes and ties a lubber with a lanyard, digs a hole in the beach, shoves him in chock-a-block up to his neck, then backs astern, and watches the salt spray washing over his figure-head. A rare good lark; but it nearly killed him!'

'Well indeed, that's odd,' exclaims the major; 'marvellous! Of that very party I, then a young lieutenant, was one. I had come down from Arcot, where my old regiment was, and was wasting my time, my health, and my money in Madras. Yes! I recollect it all as if yesterday—the dinner, the sallying out, the *burial*. I remember too one of us putting that part into doggerel verse, one stanza of which ran something like this:

We buried the skipper quite close to the sea;
And how loudly the old salt did bellow,
For his neck, and his head, and his *sola topee*
Were all we left out of the fellow.

'The sea-faring gentleman had been rude in his cups, told us we were only "locals," had no military rank west of the Cape of Good Hope, were only nigger officers, and had otherwise riled us; so, as our friend opposite has just told you, we turned him into the shingle, and didn't care a *pice* if he never got out again.—Stay! stay! The fellow's name and the name of his ship, which I had long forgotten, have suddenly occurred to me. •Y-e-s! Mayne Brace—Captain Mayne Brace of the *Smiling Sue*—that's it!'

The company, bar two, burst into a roar of laughter. The silent ones were the major and the skipper. The former did not understand the joke; the latter understood it but too well. Mayne Brace was his own name, and the *Smiling Sue*, his craft, was at that moment at anchor in the harbour hard by. Never for a moment dreaming that one of the practical jokers could be present, the captain had told as his 'good story' *what had actually been done to himself*. He never told it again.

L—, an army doctor noted for his voracious appetite, was quartered in Kingston, Jamaica, and there got yellow-fever. Bleeding, calomel, blisters, and the other stereotyped remedies of the day failed to kill him, as they were killing scores around; he pulled through, physicians notwithstanding. One morning during early convalescence the highest medico-military authority of the island came to see him. 'I'm awfully hungry,' says the sick man. 'I'd like a first-rate dinner to-day—some pepper-pot, mountain mullet, ducks and green peas, a black crab or two, and a jorum of sangaree.'

The Inspector-general is dumb-struck at the nature and extent of his subordinate's *menu*. He shakes his head. 'Gad sir, it would kill you, certainly kill you. Take some chicken-broth, a little panada, and one glass—no more—of Madeira. —Ducks and green peas! Black crabs! Black-death, sir;' and he goes his ways. But L— sends for his cook; and although that functionary cannot get all the delicacies his master orders, does manage to secure the birds and the vegetables, which L— eats to the last fragment, washes down with a full allowance of sangaree, sleeps, and wakes in the morning like a giant refreshed. Then comes the chief for his customary visit, feels his patient's pulse, makes the usual professional inquiries, and is quite satisfied with his condition. 'Ah!' he says, 'better; d-e-c-i-d-e-d-l-y better in all respects; cool, quiet, normal. Now, my dear fellow, if you had eaten those things you wanted, and more especially ducks and green peas, we would have been, as I told you, measuring you for your coffin this morning, and playing the Dead March in Saul at your funeral at sundown this evening.—Good-day; you'll be at your duty soon.' And he was. But having told the story, and raised the joke against the P.M.O. (Principal Medical Officer), that administrator sent him to vegetate at one of the most remote and out-of-the-way stations in the command, where even ordinary beef and yams were scanty, and ducks and green peas impossible.

CURIOSITIES OF LONDON.

We learn from a contemporary that 'a curious revelation has recently been made in the East End of London. One of the chief characteristics of that densely populated quarter is the vast number of animals—cats, dogs, pigeons, fowls, and rabbits—which manage to support a precarious existence amid the gloom and dirt of miserable back-yards and blind-alleys. How such creatures continue to live where human beings die, not merely of starvation, but of downright lack of light and air, is a problem which it must have often vexed the minds of philanthropists to

solve; but live they do; and as their existence was generally supposed to exercise a humanising influence upon their proprietors, no one would ever have thought of interfering with them. Latterly, however, disquieting rumours were circulated that people who had not even a share in a back-yard or a blind-alley indulged in the luxury of poultry-keeping, and the sanitary authorities were at last moved to institute inquiries on the subject. Their activity was soon rewarded. In a room inhabited by a man and woman and their two children, twelve fowls were discovered living under the shelter of the bedstead; while in an adjoining room, owned by the same persons, a colony of one hundred and twenty-seven unfortunate cocks and hens were trying to make-believe at being in a farm-yard. Encouraged by this success, the officials persevered in their search, and in another house in the same street they discovered nearly three hundred fowls enjoying the comparative gentility of the second floor. Immediate orders were given for the removal of the birds to a more congenial atmosphere; and despite the violent resistance of their owners—who are said, by-the-by, to be foreigners—the clearance of these Augean fowl-houses was soon accomplished. But we really need a modern Hercules to keep London clean, and even he would find his place no sinecure.'

MARGUERITE.

A MODEST maiden, yet a wise,
With chestnut hair and hazel eyes,
Whose glance one always liked to meet,
So deep its gaze, so calm and sweet;
Clear beaming with a quiet gladness,
Subdued as by an unknown sadness;
Too trustful in its holy love
For aught but purer worlds above.

A low, broad brow, with dreamy thought
And noble aspirations fraught.
A subtle mingling in the whole
Of earthy clay and heavenly soul.
A face that, meet it where I might,
In joy to-day, in woe to-night,
Would cause (and why I cannot tell)
The hot tears to my eyes to well.

'Twas so, one day she crossed my path.
I half believed her not of earth,
So sweet that wistful gaze; in vain
I turned away, for look again
I must; and then I knew too well
By that, in which e'en lay the spell,
That hidden something told too true,
That ne'er in heavenly gardens grew,
As yet, this blossom, all too rare
For earthy soil and earthy air.

Ah! sweet, shy flower, 'twas not for long
That thou didst mingle with the throng;
Yet thou unconscious shed'st a ray
Of purity athwart their way,
As thou their guardian angel wert,
Though now with heavenly armour girt.
I'd not recall thee, though my eyes
Are dim with tears; though choking sighs
Fill my sad heart with many an ache,
I'll still them all for thy dear sake.

MONEY.

SIMPLE-MINDED people must sometimes be at a loss to understand the oracular explanations offered respecting the state of what is called the money market. Let us instance the following—

‘There is a very slight demand for money. Good bills are done at one or at most one and a half per cent., with no signs of improvement. Things, however, are believed to have reached their lowest depression, and as summer advances, a rise is confidently expected in the money market.’ Such is the sort of information with which certain pretentious writers favour us respecting the financial state of the country. Translating their enigmatical language into plain English, their explanations signify that because comparatively few persons are discounting bills, trade is in an exceedingly depressed condition. We should have drawn quite the opposite conclusion. When a tradesman takes a bill to a bank to be discounted, he clearly needs money, for which he is willing to pay so much by way of loan; it may be one, two, or more per cent. according to the general demand. Suppose he does not need to borrow, are we to set him down as an unfortunate being without business? In other words, is it the meaning of these writers on finance that doing business is alone indicated by borrowing, and that if there be no borrowing everything must necessarily be at a dead stand!

We protest against the fantastic reasoning which seemingly leads to these conclusions. Borrowing is usually a symptom of weakness, not of strength. We are told by a venerable authority, that the ‘borrower is servant to the lender,’ which is quite true; all attempts to uphold the reverse of the aphorism are ridiculous, and must end badly. Taking, for example, the case of a merchant who by a long course of circumspect conduct is at ease in his circumstances, keeps a good balance at his banker’s, trades within his capital, discounts no bills, we should think that he represents a wholesome state of affairs. And if such be said of one, so it will apply to all. When

everybody has all the money he requires for the honest purposes of his business, we should say so much the better. That is our doctrine, though to great financial critics it may appear antiquated and heretical.

In whatever manner it originated, there has latterly crept in the very extraordinary and pertinaciously cultivated opinion that the degree of commercial prosperity in a country is to be measured by the demand for money in the shape of borrowing. It is a new thesis, in which people are invited to have faith. If discounts are high, trade is flourishing. If little is doing in the way of discounts, the depression is heart-rending. To all appearance, the country is going to the dogs. One could be amused with these fallacies were they not associated with a species of demoralising perversity. If not expressly said in words, the inference is that borrowing is exalted to a virtue. The man who self-reliantly pays his way, and never for a moment thinks of troubling bankers or bill-brokers, is essentially a poor creature. He is at least an eccentricity. The old admonition, ‘Owe no man anything,’ is out of date. Owe thousands, or millions, if you can manage to do so. Risk, speculate with other people’s money. Such seems to be the outcome of modern financiering.

While taking exception to the ordinary disregard of a state of indebtedness, we are far from saying that in honest business, there is anything positively wrong in borrowing by discount. As an intermediary between borrower and lender, the banker performs a useful part by facilitating the settlement of accounts. Where there is a reasonable scope for enterprise, the cost of the loan in form of discount may be deemed insignificant. All depends on the soundness of the transaction. Unfortunately, a constant reliance on discounts leads to a factitious course of business, which ensues in a profligate style of living, and often ends in disaster. For encouragement to excesses of this kind, the banks generally, though some more than others, are not without blame. Indiscreetly extending their credits, in order to make

advantageous use of their capital, they raise the value of money, excite those wild speculations and courses of over-trading which, by 'leaps and bounds,' are imagined to be significant tokens of national prosperity.

We all know what this extravagant credit system has led to. Shameless frauds and thousands of bankruptcies, which sending a chill through society, have produced the national depression that is mourned over, but which in reality signifies a return to discretion and common-sense. Yet, no lesson is accepted by financial doctrinaires. It would almost seem as if large numbers had a special interest in promoting systems of over-trading and extravagance. Reminding us of the 'wreckers' of old, who threw upon alluring ships to destruction, they appear to live on promoting schemes that, terminating in ruin, yield a rich harvest from the sufferings of miserable dupes. Mariners used to be told to beware of the false signals of wreckers. In the present day, the advice to be given to all who have anything to lose is to beware of 'promoters.' There may be well-meaning men amongst them, but we see that the general upshot is disastrous. In particular, we observe how persons with a title have been induced to become directors, or more correctly decoys, to allure confiding capitalists to their ruin. Considerations of this kind suggest extreme caution in taking shares in any project, or in giving credence to the lamentations over dreadfully low discounts. Why should any one volunteer groans about money being a drug in the market? Let it be a drug. Who cares? If nobody wants it, there is little need for lamentation. A very sad thing indeed when bankers are at a loss to know what to do with the cash with which depositors have intrusted them. At this point we may be said to reach the kernel of the whole matter. What to do with money. It is a state of affairs that did not fall within the experience of the old political economists. In former times, money was so difficult to be obtained, and was so precious in character, that no one entertained the notion that a period would arrive when one of the torments of society would consist in a superfluity.

Money is a blessing or the reverse, just as we make a good or bad use of it. In the olden time, what struggles there were to effect even the smallest public improvement, owing to the want of money! Bridges could not be built, roads could not be improved, churches could with great difficulty be erected. A cathedral was not completed, except in a pinching way bit by bit over a space of perhaps two hundred years. Any attempt to levy rates for a matter of public utility would have raised a rebellion, and been after all abortive. The plain reason for all this was, that in the community generally there was no redundant cash. Excluding a few usurers and lucky individuals, the world lived from hand to mouth. How has this backward state of affairs been meliorated? Simply by two things: Settled peace and industry.

England had not a day to do well until it got rid of contending dynasties, and sate itself down to work each man according to his vocation under the protection of beneficent laws and unchallengeable government. It is remarkable how speedily the change from poverty to wealth has been effected. With a steady regard for industrial occupation, a hundred and fifty years have done it.

The marvellous growth of the metropolis, the rise of busy seaports, and the spread of railways, are the more conspicuous phenomena in the new condition of things that has sprung up. Capital has increased so largely that it presses for investment, and rushes headlong into all sorts of extravagances. Among the numerous modern wonders, the most wonderful, as it may be esteemed, is the fact that Scotland and Ireland, both treated as contemptuously poor in the early part of the eighteenth century, and the subject of diverting sarcasms on and off the stage, have absolutely come to the front as lending countries. Irish and Scotch banks have had the audacity to set up branch houses in London—much to the disgust, as it appears, of certain native firms, who view them as a species of interlopers. As a feeling of this kind is altogether foreign to the spirit of fair-play which distinguishes the English character, we may anticipate that it will come to nothing. It is mentioned here only as a curiosity of modern finance; having its origin in the general redundancy of accumulated capital.

Every country aspiring to civilised usage, begins with an infancy in finance, when paper-money for small sums is accepted as a necessity. Bank-notes for a dollar for five francs, for five shillings, at one time prevailed. Discreetly managed, those paper representatives of money served a useful end. A time comes, however, when by the progress of wealth they may without disadvantage be dismissed. Every one who has studied the subject will acknowledge that one-pound notes have been of inestimable value to Scotland, in fact have helped enormously to make the country what it is. There are reasonable doubts, however, if this species of paper-money is any longer an essential condition of national prosperity. In our opinion the country could now successfully dismiss its one-pound note currency, and place itself on the same financial level as England. Bankers might not be indisposed to take the same view of the matter, for so large is the proportion of gold they must keep in relation to their note issues, that the change would not be of serious importance. The chief objection would be on the part of the community, by the great mass of whom, strange as it may seem, notes are invariably preferred to sovereigns. That whimsical notions of this kind would speedily disappear, can scarcely be doubted. The withdrawal of the one-pound note currency would at any rate remove difficulties which at present perplex the international position of the banks.

It must come to this at last. A wise policy would consist in looking the inevitable in the face, and in making preparations accordingly. W. C.

YOUNG LORD PENRITH.

CHAPTER XXXIV.—MR DICKER.

'GLAD to see you, Captain Ashton!' said Mr Dicker good-naturedly, as he gave Hugh a forefinger to shake, and waved him to a chair. 'Knew your name at once—not likely to forget it—for, my dear sir, you have rendered me a still greater service than I was aware of, when last we met.'

Hugh was pleased with the cordiality of this reception, but his looks expressed a not unnatural surprise, which the capitalist was not slow to note. He condescended to explain.

'I told you, Captain Ashton, that the papers which that poor, faithful fellow Purkiss—I shall never get such a clerk again—brought over in the purple bag, and which your courage preserved for me, were of considerable value. They were indeed of very considerable value—more so than I dreamed of. He had done very well indeed, had Purkiss, as my agent out there; and I am a richer man, if I chose to realise to-morrow, by— Well, well, never mind how much—what with wool, and copper, and land, and gold, and the rest of it. The securities thus saved represented something worth having, Captain Ashton.'

Hugh had no doubt that they did; but he scarcely knew what to say in answer to Mr Dicker's harmless vaunt, and merely smiled.

'I am a warm man, as we say in the City, as you may possibly have heard, Captain Ashton,' said Mr Dicker, rattling some money in one of his pockets in a slow, lazy manner, as though he enjoyed the tinkle of the sovereigns as they slipped one by one through his fingers.

'I can well believe that, sir,' answered Hugh, who had no doubts as to the warmth, financially, of his moneyed acquaintance.

'And this colonial business has brought in a very tidy return, very tidy,' said the capitalist, tapping his still sound and strong front-teeth with an ivory paper-cutter. 'You ought to have your share, Mr Ashton.'

'My share, sir? I can hardly understand you!' answered Hugh, in some surprise.

'Yes, yes,' returned Mr Dicker, half-impatiently, and with a glance at the clock. 'You preserved for me vouchers of no trifling value; without which, had they gone to the bottom of the sea like that poor fellow Purkiss, I should have met with vexatious delay and practical loss, in endeavouring to assert my rights. So, as a matter of business, and as usual among business men, I shall be happy'—and he picked up a pen, and rustled over the leaves of his cheque-book as he spoke—'to write you an order on Clink and Scales, of Lombard Street, for'—

'Excuse me if I interrupt you, Mr Dicker,' broke in Hugh Ashton, the colour mounting to his sun-bronzed cheek and brow. 'So far as I understand, you desire to do me a kindness, but a kindness which I cannot accept. It was not to solicit money from you that I came here to-day.'

The capitalist, in the very act of filling up the promised cheque, looked up at Hugh's face,

and arched his eyebrows in very genuine surprise. According to his experience, which was a tolerably wide one, money came amiss, on whatsoever pretext, to nobody; and he had known it to be eagerly grasped at, not to say angled for, by the very finest of fine gentlemen and ladies with whom he had conducted negotiations in the course of an active and pushing career. Colonels and countesses, legislators and leaders of fashion, each and all of these had proved willing to take a bribe for services to be rendered in puffing some newly blown soap-bubble of the Stock Exchange, provided that the bribe were delicately administered, and called a commission. And here was this youngster—a master-mariner, an ex-fisherman—whose tone and countenance expressed actual indignation at the offer of an eleemosynary draft on Clink and Scales.

'Bless me!' exclaimed Mr Dicker, hardly knowing whether to be irritated or not; 'you really are a very extraordinary young man!'

'Do not mistake my meaning, Mr Dicker,' said Hugh quietly; 'I am sure that your intention was kind, though I cannot accept the kindness in the form of ready-money. That is all.'

'You'll never get on in life, Mr Ashton, never!' returned the self-made man, laying down his pen, and surveying Hugh with a look of mingled pity and admiration.

'I daresay that I shall not, sir, in the usual sense of the word,' answered Hugh with a slight smile.

'Well, well,' said the capitalist slowly, and with a sort of philosophic tolerance of error, 'it makes a difference of course, in matters of business, whether one has learned to look upon things in a business light.—But what can I do for you, Captain Ashton, since I must not draw you a cheque? I am your debtor, very much your debtor, for the service rendered the other day, and that even more so than I thought when last I saw you. Along with my securities were certain private papers that had been deposited in an Australian bank, and the recovery of which would be of the utmost consequence to a poor friend of mine. I call him poor; but time was, that in our intercourse I was the obliged party.' And Mr Dicker laid considerable stress upon the personal pronoun, as though the circumstance of his being under obligations to somebody else had been a portent indeed.

'Yes,' continued the capitalist, who had grown earnest now, as some newly awakened train of thought occurred to him, 'I don't mind telling you, between ourselves, that I was once a very poor and struggling man, and didn't find too many hands stretched out, I can tell you, to help me as I toiled up those lower rungs of the ladder of life that are always the hardest to climb. This friend of whom I speak, a gentleman born, stepped out of his way to do me a good turn, and I keep the memory of his kindness green and fresh, Mr Ashton, I assure you. I cannot mention his name, even would it interest you, as of course it could not—reasons against that! But, at anyrate, there were papers belonging rightly to him in that purple bag that you prevented from becoming flotsam and jetsam, and that he would gladly see, if only I could find his present address, poor fellow! Dear me, I have wandered sadly from the point. It is not often in the City that we

have the leisure or the inclination to indulge in sentiment.—And now, what can I do for you, my dear sir?" asked the capitalist, again becoming conscious of the clock, and of the candidates for admission that were chafing in his anteroom.

Hugh answered modestly enough that he had come to Guildhall Chambers for the purpose of asking Mr Dicker's advice. He had left Cornwall for ever, had resigned his late appointment, and was now in search of something to do.

Mr Dicker pursed up his lips, and contemplated his young acquaintance with a rueful sort of interest. 'Rolling stones, eh—but you know best, of course,' he said, again tapping the teeth of which he was proud, with the paper-cutter. 'Sudden—wasn't it?'

'I see, sir, that you think I ought to have stayed,' answered Hugh, in his frank fearless way; 'and, as a man of the world, I am sure you judge rightly. I have a sorrowful conviction in the truth of the old proverb you quoted but now, and wish for nothing more than to be steady. It was no mere restlessness, believe me, that has made me give up my ship and leave Treport.'

'No, no; of course not,' said Mr Dicker, casting about for a motive, and, as men of the world always do, looking out for a vice or a weakness on which to graft it. That Hugh had left the Tug and Salvage Company in disgrace—that he had done, in common parlance, anything wrong, his previous experience of Hugh's conduct, and the singularly noble bearing of the young sailor, forbade him to believe. The capitalist was for a moment at fault. Suddenly his countenance cleared. 'Yes, yes; the lad must be in love, and crossed as to his wooing, either by disinclination on the fair one's part, or, much more probably, by the harsh prudence of parents.' And Mr Dicker, who regarded love as a youthful disorder akin to measles or whooping-cough, was sincerely sorry that his young friend should apparently have taken the complaint in an aggravated form injurious to his worldly prospects. 'I hardly know what to advise,' he said, thoughtfully rattling the sovereigns in his pocket. 'Would you like to go to sea again, or abroad?'

'I should prefer,' answered Hugh, with some hesitation, 'to stay in England, if I could but earn a maintenance by anything within my power to do.'

'Stop—I have it!' exclaimed Mr Dicker, beginning to toss and tumble over some papers that lay before him on the table. 'We want a station-master. I am deputy-chairman—you may have heard as much, perhaps—of the Extreme South Line, at—where is it?—yes, Hollow Oak, in Dorsetshire. The manager sent me word on the subject a fortnight ago, and the appointment rests with me, since old Sir Bodkin, the chairman, is not in a fit state of health to attend to details. Would Hollow Oak suit you? It is a quiet place, somewhere west of the New Forest. And the salary is a hundred and something a year; whether forty or sixty, I cannot remember. Of course there are coals and candles, and of course there is a house to live in—and those I suppose are all the advantages of the situation. Such as it is, will you accept the place?'

'Certainly, and gratefully, Mr Dicker,' said Hugh, with quick decision. 'If you will give me the place you speak of, I will promise to do

my best in the duties I shall be called upon to fill.'

'Then, very well,' said the capitalist, who by this time had become painfully conscious of the clock and the flight of time, and the many interviews that lay before him. 'I will send you in the morning, by a clerk, your credentials. You will then have nothing to do but to start by an afternoon train—there is one, I think, at two—yes, at two—and you will be at Hollow Oak at six or thereabouts. And what, Captain Ashton, is your address?'

Hugh mentioned *Shadwick's Inn*, Shadwick Place, E.C.

'How very odd!' answered the capitalist, again oblivious of clock and engagement. 'I know the place; but very few, even among Londoners, do. It was in the little, gloomy, three-cornered coffee-room of that secluded inn that the friend I have mentioned—and whose papers I have here—met me, and lent me the money which — No matter, Captain Ashton—he was a gentleman by birth, and— Never mind. Something in you reminds me of him; I cannot tell why. Good-bye, dear lad!' And he gave Hugh his whole hand to shake; and there was an end of the interview.

CHAPTER XXXV.—MAUD GOES HOME.

There was a stir and a suppressed ferment of excitement in Blosthucl Court, to which every human heart pulsed in strange unison. A letter from Maud's mother had arrived the day before, summoning Maud home, if Alfringham, her uncle's rural palace, might be called by such a name, as the widow of Colonel Stanhope did not scruple to call it. As a general rule, Mrs Stanhope's letters were of no very great account. She sent a good many of them, having belonged to a letter-writing generation, and to a gushing age. But now, as Lord Penrith's mouthpiece, she spoke, or rather wrote, with authority. Her brother, he said, was worse—well, he never was—but now his state of health was critical, and Lord Penrith was longing for Maud's return. 'Come at once!' said the letter; and if itches and under-comings could prevail, Maud should indeed have felt herself bound to hurry.

'Of course she must go!' the lawyer had said decisively, but regretfully, for the loss of her pretty niece at Blosthucl meant to her the almost hopeless isolation of a benevolent female despot among her servants and tenantry. She had a few clergy to visit, and here and there a scarce family of the estate class, and that was all. She paid the penalty, in a social point of view, of dwelling in a picturesque and impossible corner of England, near which no ties of sport or business can tether the well-to-do.

'Nobody lives in Cornwall,' Lady Mary Tattles would say, if you asked her, at five o'clock tea, in Grosvenor Place, what were your social prospects in the ancient realm of King Mark; and Lady Mary would not be far wrong. Squires are rare in Cornwall, and country society widely scattered. Lady Larpent lost a good deal in losing Maud.

But Maud must go. The wishes of old men in Lord Penrith's position are paramount. He was so rich, he was so free to do as he liked with Alfringham and all that appertained to it, that had he chosen to pick out a stable-boy as his heir,

or, like Pope's Miser, to endow a college or a cat, none dared even to venture on remonstrance. Certainly, Maud must go. There was packing in hot haste. Maud's maid and my Lady's abigail impeded one another as they folded and packed and locked trunks, and found that things inestimable had been overlooked, and at the last moment thrust them in, and kept everybody within their influence in a mild state of feverish flurry. Sir Lucius Larpent was to escort his cousin to Alfringham. Nothing, considering the relationship, could have been more proper, or, to Maud's taste, less congenial; but still she had to submit.

'I am very sorry to part with you, my dear; but of course in such a case there is no help for it. And it is a comfort that, next week, Edgar and Willie come home from school,' said Lady Larpent. And then came the parting itself, and the drive to the station, and the railway journey itself, swift and smooth, eastwards from that far outpost of sea-girt Britain where Llosthuel looked out over the endless billows of the Atlantic. Young ladies are seldom given to abstract speculation, and it is not very likely that Maud Stanhope contrasted the comfort and monotonous ease with which the modern first-class passenger is conveyed, amid rugs and cushions, sun-blinds and foot-warmers, to his destination, with the pilgrimage that a winter's journey from Cornwall once was, even for travellers of her own rank in life. No more anxiety, nowadays, as to floods certain to break bridges and render fords impassable; no more fear of highwayman-haunted heaths, and no dread of the clumsy family coach, painfully dragged along the vile roads by six horses, being buried in a snowdrift, or 'stugged in the mire,' on wild Dartmoor. No more riding, belated, with chilled feet that could scarcely feel the steel stirrup, and the collar of the loose 'horseman's coat' turned up to screen off the driving drift, as the bewildered guide tried to regain the track, easily missed when once the short December day had blackened into early night, which led across the waste. We most of us, however, forget or ignore the sufferings of those who went before us, and merely resent any trivial interruption in the clockwork regularity of existing arrangements.

There is no railway station nearer to Alfringham Hall than the small one of Hollow Oak, four miles and a half away. Lord Penrith had, indeed, like many another lord of lands, done his best in parliament to exorcise the railway from his estate, and had reluctantly consented under compulsion to derive indirect benefit from the detested innovation. At Hollow Oak, then, Maud and her cousin Sir Lucius found, on alighting there, one of 'my lord's' carriages waiting for them. For a good many miles round Alfringham Maud's uncle was 'my lord' in popular speech, and Cowper's mighty Monsieur Nongtongpaw scarcely seemed a more universal proprietor than he was. Some such reflection probably suggested itself to the self-seeking mind of Sir Lucius. He had not been very talkative during the hours of the railway journey, burying himself in his newspapers or lounging in his corner, with half-shut eyes, and leaving his fair kinswoman to her novel and her own thoughts. Once indeed, the baronet had spoken with a certain amount of energy, but even then the choice of a topic was unfortunate.

'You can't think how glad I am,' he had said amiably, 'that that confounded fisherman fellow that my mother chose to take up, has had to take himself off from our neighbourhood. I don't profess to know what he had done to make the country too hot to hold him'—

'I am sure, Lucius, that you do Mr Ashton cruel wrong!' interrupted Maud, with flashing eyes and quivering lip; 'and that you are unjust in attributing bad motives to his leaving us—for his leaving Treport, I mean. I never saw any one in whose honour'—

'Honour!' somewhat rudely broke in Sir Lucius, 'honour! forsooth, when you are talking of a cad like that! But if you women will insist on making a model hero of the man, it is useless to argue the point.' And he savagely banged down the window nearest him, and, turning his face away, neither spoke to his beautiful cousin nor looked at her for many a mile. On the way, in Lord Penrith's carriage, to Alfringham, the baronet found his tongue again. 'I owe you an apology, Maud,' he said, 'for my uncivil speech an hour ago; I was irritable, and I behaved like a bear. I do hope you will forgive me, Maud.'

'Well,' replied Miss Stanhope in her gentle voice. 'Let us think no more of a hasty word!'

'But Maud, dear Maud,' went on the baronet in his most persuasive accents, 'will you not push your generous impulse a little further, and give me hope—a little hope? If only you knew how I longed for it!' he added, with an earnestness that seemed real.

'You mean'— Maud came to a stop here. It was not for her to interpret her kinsman's meaning.

Then Sir Lucius spoke out, glibly enough. It was Maud's love he asked for. It was Maud, whose consent to be his wife, withheld from him till now, he sought as a suppliant. He did not, he would not, press her for an immediate answer. She need not say 'Yes,' or enter on a formal engagement at once. Only let her shew a little kindness, only let her tell him that he need not despair. A word, a look, a pressure from her little hand—of which, at an early part of the conversation, he had contrived to possess himself—would suffice to revive his hopes, and then he would urge her no more.

But Maud Stanhope was not foolish enough to purchase a respite from unwelcome addresses by giving any such assurance, on which a future claim would certainly be founded. Gently, but resolutely, she drew her hand away. 'I can but repeat, Lucius,' she said as kindly as she could, but quite steadily, 'what I said to you before, at Llosthuel. You had better learn to regard me simply as a friend—as your sister, if you will—for what you now wish can never be.'

'Come, come, Maud; this is not fair treatment for a man, after all that has come and gone,' returned Sir Lucius reproachfully.

'Nothing has come or gone between us two,' answered Maud firmly, 'that gives you the right to complain of unfair treatment at my hands. As a friend, I can never cease to regard you; but your wife I shall never be.'

'And would you thwart everybody's wishes—and—and upset the family arrangement, just for a whim?' cried Sir Lucius, very angrily. 'You know I must be Lord Penrith. You know our

uncle will leave every stick and stone of the estate to you. And it has always been an understood thing that the title and the property were to come together again. You would be a peeress, Maud. And it is a shame, indeed it is, to throw over a man as you do me !'

Sir Lucius, in spite of all remonstrance, enlarged upon this theme so vehemently, and became so eloquent as to the wickedness of his kinswoman's conduct in rejecting his proposals, that when the carriage drew up before the stately doors of Alfringham, Maud was in tears ; and it was all that she could do to preserve a tolerably decorous air of well-bred calm in passing through the lighted hall, with its double file of liveried serving-men drawn up for the reception of the new arrivals. Mrs Stanhope, who had come three steps beyond the door of her favourite pink drawing-room, to meet her daughter, saw the glistening traces of tears on Maud's eyelashes as she kissed her, and very likely guessed something approximately near the truth.

'So kind of you to come, Lucius,' said the faded beauty, putting out her jewelled fingers to her nephew. 'You will stay some time, I hope, to cheer us up at Alfringham.'

'I shall be off to-morrow, thank you ! I only came to see Maud home,' answered the baronet, with a brow like a thunder-cloud.

Mrs Stanhope sighed. She saw that her nephew was in a very evil temper, and augured ill for the prospects of the family arrangement, which she had as much at heart as it was possible for her to care for anything. And this was Maud's welcome to her Dorsetshire home.

ORAL INSTRUCTION OF THE DEAF AND DUMB.

At a Teachers' conference held in January of last year, Mr Van Praagh gave a complete and interesting explanation of his 'oral' method of teaching the deaf and dumb. On this interesting subject we would direct attention to the following remarks.

Both Professor Wallis in Oxford, and Dr Amman in Holland, commenced to practise this system at the same time ; but the credit of resuscitating it and putting it into general practice belongs to the Germans. Mr Van Praagh affirms that the expression 'deaf and dumb' is a misnomer ; deafness is originally the only defect, and dumbness is the unfortunate result. Ninety-nine out of every hundred deaf-mutes can be taught to speak ; and every deaf-mute, unless he prove to be an idiot, can be so far taught by this oral method. This method of teaching by lip-reading requires great study, patience, and devotion. A mother in teaching an infant to say some simple word is obliged to repeat it over several times, while the child watches the movement of the lip and endeavours to imitate the sound. The same patience and frequent repetition are necessary with a deaf-mute ; and as the ears of the latter are shut to the entrance of sound, the training must take place through the eyes, which must do duty for both seeing and hearing. In teaching them to speak, the child is taught to breathe properly, to imitate the position of the teacher's mouth and

face, and the ordinary vibrations caused by sound. When a sound is produced, it is repeatedly practised until the pupil can reproduce it without help. Vowels are taught to begin with, then consonants ; afterwards combining the vowels and consonants into syllables and words ; the meanings of which are either conveyed by showing the objects they represent, or by models or pictures. As soon as possible the children must make use of the spoken words ; when the teacher next goes to polysyllables and short simple sentences, and without teaching the terminology of grammar, the child's attention is drawn out towards the qualities, quantities, and actions of objects taught.

The instruction in lip-reading, writing, and speaking proceeds simultaneously. The progress made is slow but thorough. In spelling, a purely phonetic system is followed ; only the sound of the consonants is given to the children, a murmur or a hiss as the case may be, but never mentioning the names of the letters.

In speaking to deaf children who have thus been trained, we must remember that lip-reading has with them taken the place of hearing, and that it is best to speak slowly and without making contortions of the face. All artificial signs and the finger alphabet are rejected by this German school. The French system of teaching as invented by De l'Epée, makes artificial signs ; and the finger alphabet the means of communication and instruction ; but the German method makes no use of these signs. The latter system goes upon the principle that lip-reading requires the sole and undivided attention of the child, who cannot watch the movements of face and hands at one time. Writing and reading are taught, as already noticed, at one time, by means of lithographed instead of printed type, which is found to be a vast saving of valuable time.

A lady who has paid a visit to Dr Van Praagh's establishment favours us with the following :

The 'oral' instruction of the deaf and dumb' seems a contradiction in terms, but it is in fact a reality. At the Normal School, 11 Fitzroy Square, the success of this strange and wonderful system, which has been in use there since its foundation about seven years ago, may be fully tested. My visit to the school was paid on a very rainy day, and many of the pupils who reside with their parents or board in the neighbourhood were absent. There were, however, I suppose more than forty children of various ages, and divided into classes, all at lessons.

The director, Mr Van Praagh, had himself been teaching the first or youngest class, when my coming interrupted the lesson. These were made to repeat after him, watching and imitating the action of his lips, the vowel sounds, the word 'pa-pa,' and to reply to some questions : 'How do you do ?' 'What is my name ?'—the answers given being not mere parrot-like repetition ; for one little girl when asked several times over : 'Why were you not at school yesterday ?' caught at last the meaning of the lip-motions, and answered : 'I was poorly.' So strange and even startling was it to hear words actually pronounced by the so-called dumb little lips, that I fear my impressions of this first or elementary class remained somewhat confused on leaving it.

Assistant teachers—who are not deaf and dumb, and whose training for the work is carried on in

the school by Mr Van Praagh—were superintending the older classes. The necessity of making the pupils repeat over and over any word which they do not pronounce distinctly, as also of making them distinguish the labial (lip) sounds, *b*, *p*, for example, from one another, seemed to be specially insisted on by the director, whose patience is hardly less wonderful than his skill. To one of the classes—children who, if I remember right, had been in the school for about two years—he himself gave a 'dictation lesson,' first calling their attention by stamping his foot, the vibration being felt, and making them instantly look up. What he then said I did not hear, though standing close by, the words being uttered to himself; but the children, eagerly watching his lips, took their slates and began to write. In a minute or two they had written—'This lady has never seen a deaf-and-dumb school.' The writing, by the way, was very good, one reason for which may be that lithographed instead of printed type is used in instruction.

'Now,' said Mr Van Praagh, speaking aloud, 'speak to the lady. Ask her where she comes from.' A boy immediately asked me the question. I replied, speaking slowly: 'I come from Scotland.' The boy audibly repeated my words, but hesitated at 'Scotland.' I said it again; and a boy on the opposite side of the table caught and repeated aloud the word, and asked in return: 'What part?' My answer was understood.

'Why is not So-and-so at school to-day?' said Mr Van Praagh to the children, adding: 'Perhaps it is the bad day. He is afraid of being melted.' The children at once laughed. They talk to each other by the lip-motions in the same way. No signs and no finger-language are allowed. The French, or artificial sign system, though it has been perfected to the extent of allowing rapid conversation to be carried on between the deaf and dumb and those who have mastered the sign language, is of course useless when the knowledge is only on one side.

The German or oral system, introduced into England by Mr Van Praagh about ten years ago, enables deaf-mutes to understand any one who will speak slowly in language familiar both to himself and the deaf but no longer dumb person.

Our visit to the most advanced class, whose course of instruction came nearest to the prescribed length of about eight years, was exceedingly interesting. With several of the boys in this class, Mr Van Praagh talked with the greatest ease. Here is a specimen of the conversation, the boys' answers being perfectly fluent and ready.

'You read the newspapers, don't you?'—mentioning the boy's name. 'What newspaper do you read most?'

'The *Standard*, or *Daily Telegraph*.'

'What do you read about?'

'About the Afghan war and the Zulu war.'

'What is the name of the Zulu king?'

At this the boy, as might be expected, shook his head, and said: 'I can't remember.'

'Shew the lady your drawings,' said Mr Van Praagh to a bright-looking young girl, who immediately rose and fetched them; and very good they were—copies from casts. I saw also excellent specimens of needlework.

Wishing to express my surprise and gratification

to the children, I was about to tell them that I thought all I had seen 'wonderful;' but the director stopped me.

'No; don't tell them that.' Then he said to them: 'The lady is surprised because she has never seen a school like this before. But there's nothing very wonderful in it; is there? There was a girl here the other day who had never been at school; she couldn't speak, she couldn't do anything—she was like an animal—but then she had never been at school.' The listeners, as I may almost call them, evidently followed all he said with appreciation; and I too appreciated the wisdom of his speech.

I shall be glad if this slight and necessarily imperfect sketch of a very interesting school induces any one to pay a Wednesday morning visit to 11 Fitzroy Square, or to be present at the next annual public examination of the pupils, to be held I believe in July.

It might be mentioned that the voices of the 'deaf-mutes,' though thick and somewhat unnatural in sound, were not in the least unpleasant.

A BACHELOR'S STORY. ✓

WHAT I am now I need not tell; but many years ago I was assistant to Dr Bower of Broadhurst Lee, in one of the southern English counties.

Dr Bower was not a young man. I had been his assistant for more than three years, and I had a well-founded hope that in a few years more I should become his successor. I do not mean that I had any hope, well founded or the reverse, that Dr Bower would die—far from it; but the doctor had been very successful during his twenty-five years' residence at Broadhurst, and I knew that he would be glad to retire from the more arduous duties of his profession when a favourable opportunity offered, and he could feel sure that he was leaving his old patients in good hands.

I lived with the Bowers. The family was a small one, consisting of the doctor himself; his wife, by many years his junior; and their only child, Lucy. A dear, bright, sweet-tempered child she was, though terribly spoiled by her father. At the time I am writing of, Lucy was about thirteen. I was walking in the garden one morning, when Lucy came rushing up to me, breathless with excitement. 'Mr Williams, I've got such news to tell you!'

'Well Loo, have the kittens opened their eyes, or what?'

'No, no; nothing about the kittens; much better than that. But you would never guess if I gave you till doomsday, so I may as well tell you at once. I am going to school at midsummer!'

Lucy did not know that I had heard that news some weeks before, from her mother. To please her I seemed surprised. 'Indeed Loo. You astonish me. What will become of the poor kittens?'

'Oh, they will be quite grown by that time. It's nearly six months to midsummer. And do you know—mamma says I am to have a governess till then, because I am so stupid about my music and French and things. And she says I would be ashamed to go among other girls when I know so little; so papa has written out an advertisement to be put in *The Times*. I do wonder what she will be like!'

Lucy rattled on for some time longer; but I don't think I heard much of what she said. I was wondering too what the governess would be like. Her arrival would be quite an event in our quiet life. I hoped, like Lucy, that she would be 'nice;' but I hardly expected it. 'Most likely some hideous old maid in spectacles and a "front,"' I muttered to myself as I mounted Jetty my mare, and started for a long round.

For a whole fortnight after this I heard of nothing but the 'governess.' So many had answered the advertisement, that Mrs Bower had been quite bewildered, not knowing which to choose; but when it was known that the engagement would be only for six months, most of the applicants dropped off. At last, in fact only two remained to choose from. One, a London lady, made such market of being able to teach calisthenics, that I greatly doubted if she could teach anything else. The other was from Scotland, quite the north too. Mrs Bower inclined to the lady of dumb-bells and expanders; but the doctor went in heart and soul for the Scotchwoman. He had been educated at Edinburgh, and still preserved a fond recollection of that noble city and its hospitable inhabitants.

'But my dear, this Miss Stuart does not come from Edinburgh,' pleaded Mrs Bower. (She thought the use of the dumb-bells would improve Lucy's figure so.) 'Besides, they talk such a dreadful dialect—don't they?—and are so wild in their manners!'

'Nonsense, Jenny; there's nothing wild about them. They talk beautifully at Inverness, and this place, Bannmuir, must be quite near that. I remember my poor brother Dick and myself being at Inverness. Let me see; it must be near thirty years ago. It was when we took our tour through Scotland after leaving college. I remember seeing the women washing and beating their linen in the river. How Dick did laugh!' And the doctor smiled at the recollection of something he did not mean to tell us. 'Yes; I remember it well. It was long years before I knew *you*, Jenny;' and he patted her arm affectionately. 'I think we'll have this Miss Stuart. Just write and say we agree to the salary she asks, and she can come immediately. So now that's settled.'

Off bustled the doctor; and Mrs Bower sat down, not without some misgivings, to engage the Scotchwoman as her governess. But when her husband said 'It is settled,' then she knew it *was* settled, and submitted, like a good wife, as she certainly was.

About a week after this, Lucy informed me that Miss Stuart was coming the next day; that the carriage was to be sent to Wharton Station to meet her; also that 'mamma said Miss Stuart would have to go to bed whenever she came, she would be so tired coming all the way from Scotland.'

I at once settled in my own mind that I would not be at hand at the time of the arrival. I had heard so much about this precious Miss Stuart, that I detested her very name. I pictured to myself a tall red-haired woman—for were not all the Scotchwomen I had ever heard of red-haired?—with a loud voice and vulgar manner. No; certainly I would have no dealings with this unwished-for and, to me, unwelcome intruder. The next day, therefore, I did not return from my

rounds until I knew dinner must be over, and Miss Stuart, if she had arrived, safe in the drawing-room.

I was hardly seated at my solitary meal in the dining-room, when Lucy came scampering in. 'She's come, Mr Williams; and she is so nice! I know I shall love her awfully! She likes little kittens, and has had one of mine on her lap ever since dinner; so you see you were all wrong when you said she would hate them. And you are wrong about her looks too; for she's very pretty. Papa says so. She is not so tall as mamma, and'—

'Has she red hair?' I asked.

'O no. Such pretty hair. I was just coming to that. It is quite fair, and curled. I wonder,' added Lucy, in a meditative tone of voice, 'if it curls of itself, or whether she has to put in curl-papers, as I have?' This grave question seemed to occupy Lucy's thoughts for some time, for she did not speak again until I had finished dinner.

'I think I will go up-stairs and see this paragon of yours, Lucy,' I said as I left the table.

'Don't laugh in that way. You *shall* like her. But make haste, or she will be gone. She would not lie down when she came, but did all her unpacking; so mamma said she should not let her sit up beyond eight o'clock.'

Lucy and I ran up-stairs; but I was only in time to catch a glimpse of a shining sheaf of golden curls, and the long folds of a black dress, as Miss Stuart quitted the room by one door, and I entered it by another.

Miss Stuart did not appear at the eight o'clock breakfast next morning, so I had to go out without seeing her. Requiring to cash a post-office order that afternoon, I rode home through Wharton. As I dismounted at the post-office, I saw the Bowers' carriage drawn up at a milliner's nearly opposite. Mrs Bower was doubtless deep in consultation with Miss Meek about some new dress or bonnet; but Lucy was in the carriage; and that girl in black beside her must be Miss Stuart. They both seemed to be looking at and discussing the bonnets displayed in Miss Meek's window. Neither saw me, and I watched them unobserved. Miss Stuart's profile was turned towards me. It was not good. How could they say she was pretty? Her features seemed far from perfect, especially her mouth; it was too wide. Her hair certainly was lovely.

At last Miss Stuart seemed tired of looking at the bonnets. She leaned back in the carriage, and I thought I could see that she sighed wearily. Presently she turned her eyes full upon the spot where I was standing; a bright pink flush overspread her pale face; her eyes seemed to grow brighter and larger. Suddenly she seemed to remember that I might remark her gaze bent so steadily upon me, for she turned her head away; but soon I saw her whisper to Lucy, who immediately looked round in the direction where I had been standing; but she was too late; I had escaped into the post-office, and did not shew myself until I had watched from the window Mrs Bower come out of Miss Meek's and the carriage drive off. That day I was in time for dinner. Mrs Bower and I were alone in the drawing-room when Miss Stuart came in. As Mrs Bower introduced us, I saw a surprised and embarrassed expression on the face of the little governess, and the same bright colour which I had

noticed in the afternoon suffuse her fair cheeks and forehead. This confused me somewhat too ; but I managed to ask if she had recovered from the fatigue occasioned by her long journey. She answered that she had, quite ; and thereupon followed a rather awkward silence, which was fortunately broken by the entrance of Dr Bower and the announcement of dinner.

'Ah, Williams ! got home in time to-day ; that's right. Give Miss Stuart your arm.—I can't desert my first love, you know,' turning to Miss Stuart.—'Come along, Jenny.' And the chatty old doctor tucked his wife's arm under his own, and trotted down-stairs, leaving me to follow with Miss Stuart.

'Do you think you shall like Broadhurst?' I asked on the way down-stairs.

'It is a very pretty place,' she answered with characteristic Scottish caution ; 'prettier than I expected to find out of Scotland.'

'Then you have not been in England before?'

'O no ; hardly ever from home till now.'

Her manner was frank, and her voice soft and pleasant ; the slight Highland accent she gave some of her words sounded peculiar, but not disagreeable. Miss Stuart was certainly far from what my ungallant fancy had painted her ; and as I sat opposite to her that day at dinner, I thought I had judged too hastily as to her appearance when I had seen her in Wharton that afternoon. Her profile certainly was not good ; but the shape of her head was perfect ; her hair loosely curled, was gathered into a great shiny knot behind, and seemingly kept in its place by two bands of black velvet, which gave the whole head a massive Grecian look. It was at this time that I inwardly decided that Miss Stuart did *not* have to put her hair in curl-papers like Lucy. Then her eyes were full and large and dark ; of what colour I can hardly tell, for they seemed ever changing in hue as they varied in expression. When first I had seen her, I thought her mouth too wide. I do not think now there could be too much of such a beautiful thing. I never could decide whether her eyes or her mouth were the most expressive. I think the eyes expressed for the most part the fire, the ardour, and the sublimity of her character ; and the mouth, the sweet gentle love, and also the firm determination and calm self-reliance of her disposition. When her features were at rest, there was a look on her face strange in one so young, a look that seemed to tell that she had braved danger and sorrow, that she had overcome the one and patiently endured the other. It must not be supposed that I thought all this on the first evening of my acquaintance with Miss Stuart. It was weeks and months before I knew her well ; and long after that the full beauty of that nature was revealed to me.

That evening Miss Stuart played and sung. Her playing was good, nothing more ; but her singing was divine. Hers was a voice such as few are gifted with, the upper notes clear and ringing ; even the faintest whisper in her song thrilled one through and through. Some of her notes had a strange chord-like sound in them, and gave me that feeling which I had never experienced before from a *single* voice, though exquisite harmonies have often touched me in the same way. That feeling I can hardly call anything but *pleasurable pain*. It seems to lay hold of some inner chord

of your heart, and draw out and expand, nay almost rend that chord as the note itself is drawn out and expanded. This feeling dies away with the note that gave it birth ; but in dying, gives one last shiver and thrill of exquisite pain or pleasure, I can hardly tell which. After having sung some Scotch songs, Miss Stuart rose ; but we all begged for one more ; so she sat down again and sang *Rocked in the Cradle of the Deep*. Every one who knows that beautiful song will understand the feelings with which we listened to it, sung as Miss Stuart sung it. When she finished, not a word was spoken. She rose, and gently shut the piano. No one wanted more music that night ; that last song was enough to think of and live on for many nights.

Before the arrival of Miss Stuart at Broadhurst, the evenings at Dr Bower's had often seemed long and tedious enough. After dinner, the doctor generally went to sleep, waking up only for his cup of tea, and immediately dropping off again. On these occasions, he always had *The Times* in his hand, and doubtless thought he was reading. Mrs Bower was generally occupied with her fancy-work or a novel ; and I was fain to take refuge in *The Lancet*, not unfrequently imitating the worthy doctor by taking a nap, shielded from observation by its friendly page. Sometimes, indeed, we tried a game of whist, my partner being sometimes Lucy, and sometimes a 'dummy ;' but this at best was slow work. All was now changed, however ; there were no more sleepy evenings for us. Miss Stuart took dummy's place ; and when we were tired of whist, she would sing to us ; but we never tired of that, and the evening would be over before I thought it had rightly begun.

Under my care were generally placed all those patients who required night attendance ; for Dr Bower, though by no means sparing of himself, naturally preferred his own fireside to a cold ride, of some miles perhaps, in a winter night. This being the case, I sometimes missed part of those happy evenings ; thanks to Jetty poor beast, that I did not lose more of them ! Many a hard ride she had that I might be in time to hear Miss Stuart's last song, and hold her little white hand in mine one moment while I wished her good-night.

Sometimes when I came in late, I would find the doctor and his wife deep in cribbage, with Miss Stuart working beside them. Then I would sit down and watch her nimble fingers. How fast they moved ! How many times in a minute that bright needle passed through and through her work ! and the little diamond ring she always wore gleamed and glittered as the light fell upon it every time she raised her hand. No fine young-lady embroidery was her work, but plain long white seams. When she had finished the task she seemed to have set herself, she would fold up her work gaily and challenge me to a singing match. She had taken great pains to teach me several duets, and it was my great pleasure to look forward to singing them with her. What dangerous work it is that singing off the same music, with a golden head almost touching yours ; and a soft hand laid deprecatingly on your arm when you sing a false note, and a smile of sweet encouragement and congratulation when you have got well over some difficult passage ! Yes ; it is very dangerous. I thought I was strong, but I

was very weak. Agnes Stuart had unwittingly bound me fast in golden fetters, and I lay a helpless captive at her feet. She had not been long at Broadhurst when I loved her madly, wildly, but almost hopelessly. Hopelessly; for I saw that as each day made me love her better, so it made me quieter and more embarrassed in her presence. There was no corresponding change in her manner towards me. She was frankly kind and cordial as ever. From the first she had seemed to like me; but much as I tried to think otherwise, I could not but say to myself: 'This is mere friendship, not love.'

By-and-by I came to notice that at stated intervals Miss Stuart received a thin foreign-looking letter, covered with post-marks; and that these letters, when they came, were thrust into her pocket, not opened and read at the breakfast-table like those of less favoured correspondents. I heard Miss Stuart say she had a brother in New Zealand; doubtless the letters were from him. It was in April, I think, that these letters stopped. Every morning as the post-bag was brought in, I saw the colour deepen in Miss Stuart's cheek, and fade again when she saw there was no letter for her, or at least not the one she expected. One morning it seemed as if her patient waiting was to be rewarded. Dr Bower handed her a thin crispy letter. I could see the delighted tremulousness with which she received it. She tore it open without looking at the address; but as she saw the handwriting, her countenance fell, and I could see tears trembling on her long dark lashes as she seemed to be reading the letter; I say seemed, for I noticed that her eyes remained fixed on the same spot, and that she returned the paper to its envelope without having turned over the leaf. Soon after she left the room.

Some days after this, Dr Bower told me he was anxious about Miss Stuart's health; she was looking thin and pale, and her appetite failing sadly. 'She says there is nothing the matter but a bad tooth, which keeps her from sleeping, and she asked me to take it out; but I won't do that unless it gets all the worse. I think she ought to have more exercise; that walk with Lucy is not enough. But I have made up a tonic which I think will do her good.'

The doctor's tonic or something else did do good; for after this she seemed to improve in health and spirits, notwithstanding the tooth, which continued obstinate, and which therefore was doomed. She asked the doctor to rid her of this perverse piece of ivory, so beautiful, but so cruel; but he refused.

'My hand is not so steady as it once was, my dear; but Williams there will do it for you, if you are determined.'

Miss Stuart was determined; and though sorely against my will, I was obliged to consent. The next morning she came into the surgery, where I was sitting alone. 'Mr Williams, take it out now, please. I have had a bad night again; and while it goes on like this, I can't do my work properly.'

'Oh! dear Miss Stuart, don't!' cried Lucy, who had followed.—'Mr Williams, don't do it. Only wait till papa comes.'

But Miss Stuart was resolute. She was a little pale; but perhaps want of sleep had made her

so. With a smile, she sat down, and said: 'I would rather you did it now, please. It will be over; and I don't want a fuss.'

I felt compelled to do her bidding. After all, it was only taking out a tooth. I had often done the like before, and would often do it again; but my hands trembled, and I made sad work of it.

'Is it out?' she asked after a fearful wrench, during which she had sat still as a statue, her two cold hands clasped tightly together.

'No; it has broken,' I said. 'But I can leave it so. I can file it down so that you won't feel it.'

'But that won't prevent the pain coming back. You had better take it out, Mr Williams.' She was braver than I was.

'It will hurt you a good deal. Are you sure you can bear it?'

'Yes; but make haste,' she answered almost impatiently.

I went behind her this time and made her rest her head on me. She never moved, though I must have been an age in getting out that hateful tooth. At last it came. But the lovely head was not raised; it sank lower, lower upon my breast.

'Lucy!' I cried. But Lucy had run off; she could not bear the sight of her dear preceptress suffering pain.

I held that fair head in my arm; I kissed those rings of gold, those living links that had bound my heart to hers. I kissed those darkened eyes; my day when they shone upon me, my night now when closed, but what sweet night! At last they opened, and looked full at me. She raised her head gently from my arm, and said: 'I have been a little faint; I am better now.—Yes; I will have some water. Thank you; and thank you for having taken it out. Now; I shall do nicely. Where is Lucy? We must go on with lessons.'

I was bewildered, she rose from her seat so calmly, she spoke so firmly. Had she been conscious of what I had done? Had she felt those soft long kisses in which my heart had pressed through my lips? I *must* tell her now. Let her think what she would of me, I must tell her how I loved her. When I looked up, I saw that she had glided away, and I dared not follow her.

That afternoon, Mrs Bower, the doctor, and Lucy went to pay a visit at some distance; they would not be home till late. I wondered if I should see Agnes. I always called her Agnes in my own mind now. I knew she had not gone with the Bowers; but I asked the man who waited upon me at dinner, if she had.

'No sir. Miss Stuart has had her dinner fetched into the schoolroom, which she 'as not 'ad time to eat a bit of it, for I see her agoing out as I fetched in the celery.'

Had she gone out to avoid me, I wondered? It was the first of May; but the evening was unnaturally cold; the wind had risen, and the sun was setting amid red and angry-looking clouds. Not waiting till the table was cleared, I hurried out and looked round for Agnes. She was walking on the terrace; I could see the white feather in her hat flutter and wave in the wind. I determined to join her.

It seemed as if she had divined my intention; for she came towards the house, saying as she met me: 'I find the wind rather too cold to be

pleasant; but it is a fine evening for a walk.' Then she passed on into the house.

I went to the grassy terrace where she had been walking; the turf which her tiny feet had pressed but a minute ago, now yielded to my heavier tread. 'I will go and have it out with her; I can't go on like this. I wish I had spoken in the morning. Can she care for me?' One moment I warmed with hope; the next I grew cold, and shivered with doubt and fear. I resolved to go and find her. Anything, even her scorn, would be better than this. But I knew she would never scorn me; she was not one ever to trample on a true man's honest love, even if she could not return it. Then something within me seemed to say: 'She *does* return your love. Ask her; try her.'

I hastened to the house, and up to the drawing-room. The evening was so chilly that a fire had been lighted there; but the room was empty. Down again I went, and looked into the dining-room; but there was no one there. On the opposite side of the hall there was a little room which, since Miss Stuart came, had been used as a schoolroom; it had a glass door, opening upon the carriage-drive. There, seated on a low chair by the window, sat Agnes. Her hat was lying in her lap, and she was unconsciously stroking the soft white wing which was fastened in it, looking all the while far off into the distance at the fierce red sky. She did not look up at my entrance or seem to notice me till I came and stood quite close to her. Then she said in a strange hard-sounding voice: 'You have not walked far.'

'No. Like you, I found it too cold to be pleasant.' Then there was a silence, which it seemed hard for either of us to break. She had taken her hand off the soft white feather; she was leaning her head now on that hand. Some sudden impulse moved me, and I put out my hand and touched that glossy wing; stroked it slowly, gently as she had done. Then at last she looked up at me with a little smile, then a little sigh.

'Do you like my feather?' she said. 'I had it sent me from far away; so I love it.'

'Your brother'—I began.

'No; not my brother,' she said; and it was not the reflection of the red clouds that made her cheeks light up into that warm glow; it was not the cold wind without that made her voice so tremulous as she spoke. She went on as if it were a task she had set herself. 'Not my brother; but I thought until quite lately that you knew; and now I think—I may be wrong, but I think I ought to tell you. I have been engaged these four years, and hope to be married in the summer.'

I was about to stammer out some words of congratulation; but she spared me.

'Now, I will tell you about it,' she said in a low hurried voice. 'Sit down here by me. Four years ago, when I was only eighteen, I promised my cousin Walter to be his wife. He had a good appointment at Madras, and I was to go out with him. Our marriage-day was fixed; when my dear mother fell ill of fever. I could not leave her. Walter could not stay; so he went, and I was to follow when my mother should be well. But she died. And next my twin-sister was taken. Then my eldest sister grew ill. She recovered from the fever, but not from its effects, and I nursed her until last June. I had written to Walter not to

wait for me; but he would not let me give him up. So Jeanie—my only sister now—is to take care of my father; and Walter is on his way to Scotland. I thought if I came here it would be like beginning to leave home. I wanted to let Jeanie have a trial before I was quite away. And I wanted to make a little money too; for I could not go to Walter quite empty-handed, you know; and we are very poor at home. I had no letters for a while; but one from Malta yesterday tells me he is near home. I told Mrs Bower part of this when I came. You have all been very kind to me. I have been very happy here.'

'Will you let me be your friend?' she said after a moment's pause, and turning her eyes for the first time towards me. She had kept them fixed on the ground while she told me her story in short, quick sentences, and in a very low voice. 'I should like always to be friends with you,' she said simply, holding out her hand to me. 'I am sure Walter will like you when he knows how kind you have been to me. Do you know, you are so like him! When I first saw you, it almost frightened me. But now I know you so well, I don't see it so much.'

I had taken her hand in both mine. I could not speak; but I bent my head and kissed it, and I did not feel ashamed of the tear I left upon it.

'That must be the carriage,' she said gaily, as she gently drew her hand from mine and walked out upon the drive. I watched her in the twilight from the window of that darkened room. No need to follow her now. She had told me her secret; she knew mine. Agnes Stuart is my friend; and so is Walter, her husband.

I never succeeded to Dr Bower's practice; but I did succeed to something better, in after-years, through Mr Stuart's influence. I have no children of my own, for I never married, nor will now. But I have a godson, and his name is the same as mine. I am rich, and my wealth will one day be Agnes Stuart's. All that I had I wished to be hers long long ago; and it will be hers some day, together with a life's respect and a heart's loyal devotion.

A NEWSPAPER INSTITUTE.

At a meeting of editors recently held in America, it was strongly urged that the art of journalism should be taught in the leading colleges. The instruction received at college, however good it might be in other ways, was considered wholly inadequate to qualify a young man for a position on the editorial staff of a newspaper. He was never told what studies to take, what to learn, and what to omit. He was not taught the art of condensation, of saying much in little space, and saying it attractively and persuasively.

In England, as in America, the lack of a special education for reporters and journalists has been frequently referred to, and many suggestions have been made from time to time to meet the case. It may therefore be interesting to those who intend to adopt journalism as a profession, to know that a 'Newspaper Institute' under the auspices of Dr Mackie, has been established at Crewe. The Doctor points out that while all professions and many trades have Institutes exclusively set apart for the special tuition which they require, those gentlemen who wish to be connected with

the newspaper press have no means of becoming technically educated, except by serving a long apprenticeship with its attendant drudgery. The result is seen, he says, in editors who know nothing of the duties of sub-editors, reporters, 'readers'—who revise and correct proof-sheets for press—or bookkeepers, and are consequently at the mercy of their staff. Sub-editors are also frequently ignorant of the duties of reporters, and cannot give proper instructions. Reporters, when not familiar with the work of press-readers, give unnecessary trouble; which readers, if ignorant of the art of type-setting, materially increase by ill-considered corrections; all ending in extra expense, besides delay and error at the critical period of going to press.

With the view of enabling adults who are competent in every other respect to reach proficiency in at least one of these branches, and to be so familiar with all as to take an intelligent oversight of every department, the Newspaper Institute has been formed. But even in this Institute persons will find no royal road to learning the various departments of newspaper work. They must submit to drudgery, though probably less than that which is undergone in an ordinary printing-office. As to their reaching proficiency in any of these departments in six months, it is impossible. But in our days, many men become newspaper proprietors who have no knowledge of newspaper management; and such persons would undoubtedly profit by six months' experience in such an Institute as Dr Mackie's.

But it is as a training Institute for youths that it is chiefly intended, and arrangements have been made for their education in the following branches. 1. In Type-setting, so as to know the names of all kinds of news types; to be able to set in case of necessity; to give intelligent instructions to a foreman printer; to calculate how much space a manuscript will occupy, and how long it will take to be put in type. 2. In Proof-reading, by instructing the student to punctuate, and otherwise correct his own proofs, or the proofs of others, and to do so in the manner least troublesome to the workmen, whose interests should always be considered. 3. In Reporting, by teaching Pitman's phonography, and giving such opportunities of practising it, both in the office and at meetings, as will enable any industrious student to master the whole duties of a reporter. (Great attention will be paid to the preparation of manuscript, or as it is technically termed, 'copy,' so that it shall be readable, properly punctuated, and so fit for the printer that it may trouble neither the sub-editor, compositor, nor reader. The difference between good and bad 'copy' in a large office is almost incalculable.) 4. In Sub-editing, so that the students may have a fair knowledge of sub-editing, including the best means of securing good copy and presenting it in an attractive form. 5. In Book-keeping, by giving such instruction as will enable a newspaper proprietor or manager to superintend the keeping of a full set of books, and especially with a view to an accurate Weekly Return of profit and loss, without which no newspaper book-keeping is complete.

'While students will thus attain a general familiarity with all kinds of newspaper work, they may follow up any one department as a specialty

with the fullest confidence that six months' industrious application will fit them for taking an assistant's situation; and another six months at outside work bring them to average perfection. They will also have at the works the opportunity of daily witnessing type-casting, stereotyping, type-setting by steam-driven machinery, machine-printing, &c.; and the workmen being instructed to give every information within their power, the amount of information which industrious youths may gain in six months may be readily guessed. Every effort will be used to find situations for students on leaving the works; but any one may remain three or six months longer without extra payment, on condition that he continues to give his services.'

Such are the subjects which Dr Mackie proposes to teach, and the inducements put forth to learn. It seems to us, however, that in six months very few would be able to attain a 'general familiarity with all kinds of newspaper work,' and fewer still to 'master the whole duties of a reporter,' even if they devoted their time to this branch exclusively. It would take at the very least six months to learn the theory of phonography, and another six months to attain any proficiency in the practice; and it is obvious that a youth who could even follow an ordinary speaker would not be able to report scientific meetings and historical addresses. Still, when a youth has acquired sufficient manual dexterity to follow a speaker, he will have no lack of reporting practice at Crewe, as lectures and political meetings are very numerous, as are local Board and Town Council meetings. Agricultural, educational, and religious meetings are also frequently held. The meetings are therefore sufficiently varied to give him some conception of the nature of the duties of a reporter; and he will find six months in such an Institute worth far more than the money it costs him, should he find himself mentally qualified for a reportership.

'If I had had six months' training at the outset of my career,' said the editor of a large provincial journal to the writer, 'it would have been worth six years of my subsequent experience, and would have enabled me to take a good position very soon.' Many other reporters and editors are doubtless of the same opinion. At anyrate, other things being equal, the student is likely to be well qualified for taking an assistant's situation. We say other things being equal, because no amount of mechanical training, however valuable in itself, will make up for the lack of tact and general aptitude needed in a reporter.

In printing, also, a youth will not learn sufficient to enable him to earn anything, even if he should qualify himself for taking an assistant's situation, as few masters could engage him without his indentures. He is likely however, to become a more intelligent printer for his six months' training, and a valuable apprentice.

The Institute seems to us more useful to those who contemplate becoming reporters, sub-editors, or readers for the press; and such would learn more here in six months than they would in a newspaper office in the same amount of time. In the latter, little or no time can be given to instructing a novice, in teaching him short-hand, and in superintending his first efforts at reporting. He is left very much to himself, and is consequently a longer time in learning his duties. But in the

Institute he is placed under the care of special men, whose sole duty it will be to instruct him in the various branches of newspaper work. The advantages of the Institute to such are therefore self-evident; and as complaints are now becoming very numerous as to the falling off in ability of reporters, sub-editors, and readers, the establishment of an Institute of this kind seems to meet a want of the time.

TURNING THE TABLES.

TOM HILLS, sometime huntsman of the Old Surrey Hounds, was once sent to buy a fox in Leadenhall Market for service the next day. The commission was not at all to Tom's liking; but obeying orders, he rode to town, got his fox, and putting him, securely strapped, legs upwards, in a capacious pocket in his overcoat, turned his horse's head homewards. Somewhere about midnight he reached Streatham Common, to be suddenly stopped with the once familiar challenge: 'Your money or your life!'

'My money!' exclaimed Hills. 'I haven't got any; I am only a servant; and you wouldn't take my life, surely?'

The highwayman told him to look sharp, emphasising the injunction by pointing a pistol at the huntsman's head.

'Well, my man,' said the latter, 'we won't fall out. I want my life; so, as I've no money, I suppose you must have money's worth. You'll find something quite as good in my pocket here; so pray help yourself.'

The robber's disengaged hand dived into Tom's pocket instantly, and Master Reynard's teeth closed as quickly upon it, causing the fellow to yell in dismay, and drop pistol and reins; while Tom galloped off at his best pace, leaving his unwelcome acquaintance to bandage his hand and digest his disappointment, at leisure.

Relating his Indian experiences, Colonel Meadows Taylor tells of his being beset by hundreds of pilgrims and travellers, crying out against the bunnias or flour-sellers, who not only gave their customers short weight, but adulterated the flour so abominably with sand, that cakes made of it were utterly uneatable. The Colonel determined to punish the cheats; and this is how he did it. 'I told,' says he, 'some reliable men of my escort to go quietly into the bazaars, and each buy flour at a separate shop, being careful to note whose shop it was. The flour was brought to me. I tested every sample, and found it full of sand as I passed it under my teeth. I then desired all the persons named in my list to be sent to me, with their baskets of flour, their weights and scales. Shortly afterwards they arrived, evidently suspecting nothing, and were placed in a row on the grass before my tent. "Now," said I gravely, "each of you is to weigh out a seer [two pounds] of your flour;" which was done.

"Is it for the pilgrims?" asked one.

"No," said I quietly, though I had much difficulty to keep my countenance. "You must eat it yourselves."

"They saw that I was in earnest, and offered to pay any fine I imposed.

"Not so," I returned; "you have made many eat your flour; why should you object to eat it yourselves?"

'They were horribly frightened; and amid the screams of laughter and jeers of the by-standers, some of them actually began to eat, sputtering out the half-moistened flour, which could be heard crunching between their teeth. At last some of them flung themselves on their faces, abjectly beseeching pardon; and so, with a severe admonition, they were let off. No more was heard of the bad flour.

It is a pity adulterators at home cannot be served in the same way; pure food would be the rule, if the concoctors and venders of vile make-believes were liable to compulsory consumption of their own wares.

Sir John McNeill, a shrewd Scotch diplomatist, gained the repute of being the only European who ever got the better of a dervish. During the New-year festival, the Persian religious mendicants ply their vocation most vigorously, not merely asking for alms, but demanding such sums as they deem proper, according to the rank of the giver. A dervish tried to extract an extravagant tribute from Sir John, and the ambassador proving obstinate, proceeded to 'sit upon him;' that is to say, he established himself in Sir John's garden, just before his study windows, and relieved his feelings by making a hideous hullabaloo day and night. The diplomatist was inclined to make short work of the nuisance, but was warned that violent measures would be dangerous.

'Get rid of him if you can,' said his Persian advisers; 'but do not touch him.'

Sir John sent for a bricklayer, and gave the order: 'Build a wall round that howling beggar in my garden, and then roof it in.'

The dervish looked on composedly while the wall slowly rose round him, and made more noise than before; but when the roofing process commenced, and he awoke to the knowledge that it was really intended to entomb him alive, he clambered over the wall, and rushed away like a madman, never to trouble McNeill again.

At the opening of the electioneering campaign that resulted in Abraham Lincoln's elevation to the Presidency of the United States, the Hon. W. L. Yancey, then on his way to the Baltimore Convention, accepted an invitation to address the electors at an agricultural fair in a small town. The Baltimore newspapers determined to furnish their readers with verbatim reports of Mr Yancey's speech, and five reporters left that city together by the morning train for a junction station, where they hoped to catch another train bound for the fair-ground. As they travelled along they entered into an agreement not to take any unfair advantage of one another, no matter what opportunity for doing so might present itself. They arrived at the junction too late for the connecting train, and were in a difficulty as to getting over the intervening half-dozen miles of country. They went prospecting, four thin scribes hurrying in advance of a veritable Falstaff. At last they espied an old-fashioned wagon drawn by a lean horse, and in a very few minutes the treacherous four were ensconced in the vehicle, filling it completely. In vain did the man of fat remind them of their agreement; his expostulations were received with derision, and the driver ordered to start. The cheated reporter appealed to the countryman, offering to give five dollars for a

seat on the dashboard. The offer was accepted, and the man slipped down to help him up.

'Stop!' whispered he; 'I'll buy your horse for twenty-five dollars, cash down.'

'Done!' said the man; and the dollars were handed over.

'Now,' said the new owner of the horse, 'take him out of the traces, and help me on his back.'

It was done; and horse and rider were soon lost to view. Next day, only one Baltimore paper contained a full report of the speechifying at the fair; and four belated journalists had a bad time of it with their respective editors.

An Illinois sheriff was noted for his activity in looking up unlicensed peddlers. Taking his walk abroad one day, he came across an old fellow whom he at once concluded was an illegal trader, and inquired if he had got anything to sell.

'Hev I got anything to sell, squire?' was the response. 'Guess, I hev got blackin' that'll make them old cowhide boots o' yours shine so't you can shave in 'em. Got razors tew, an article you want, I should say, by the looks o' your beard. Got Balm o' Klumby tew, only a dollar a bottle, good for the ha'r, and assistin' poor human natur.'

The sheriff bought a bottle of Balm of Columbia, and then desired to see the Yankee's license for peddling. The document was produced, examined, pronounced genuine, and handed back to its owner.

Then said the disappointed official: 'I don't know now that I care about this stuff; what will you give for it?'

'Waal,' answered the pedler, 'I don't want it, squire; but seein' it's you, I'll give you thirty-seven cents for it.'

The sheriff passed him the bottle and pocketed the money; when the pedler said: 'I say, I guess I hev suthing to ask you now. Hev you got a pedler's license about you?'

'No,' said the sheriff; 'I haven't any use for one myself.'

'Waal, I guess we'll see about that pretty soon,' replied the Yankee. 'Ef I understand the law, sheriff, it's a clear case that you've been trading and peddling Balm o' Klumby on the highway, and I shall inform on you.' Thus he turned the tables; and the sheriff was duly fined for peddling without a license.

In the States, however it may be elsewhere, it is risky business to entrap people into breaking the law. A Mr Greenwood, a zealous enemy of the liquor traffic, lately employed two men to buy beer on Sunday in a town in New Jersey, that he might prosecute those who supplied them; but the liquor-dealers indicted him and his detectives for conspiring to induce the violation of the law; and all three were convicted, Mr Greenwood thereby losing his rights of citizenship.

Some sixty years ago, a certain Yorkshire living was held by a company-loving parson much in request at marriage merry-makings, whose clerk was equally welcome at christening tea-fights. These two worthies contrived to fall out; so it came to pass that when the clerk was due at a tea-party, he found himself obliged to forego the anticipated muffin-feast, by reason of the parson requiring his attendance. He bore the disappoint-

ment with tolerably good grace, hoping for an opportunity for retaliation. It was not long coming. One Sunday morning, advised that the clergyman was going to dine with a newly-wedded pair, instead of giving out only part of the hundred and nineteenth psalm, the wicked fellow said: 'Let us sing to the praise and glory of God the hundred and nineteenth psalm—all on 't.' Before his victim was well aware of the treat in store, the musicians were fairly on their way, resolved to go through their task, come what might. It was weary work; but they bravely persevered; sometimes only one instrument accompanying a single voice was to be heard; but singers and players were determined to do their duty, and held on somehow to the end; and the parson had to dine at home, inwardly confessing the tables had fairly been turned upon him.

The Rev. Dr Macleod, father of Dr Norman Macleod, passing through the crowd gathered before the doors of a new church he was about to open, was stopped by an elderly man with: 'Doctor, if you please, I wish to speak to you.' Asked if he could not wait until after worship, he replied that it was a matter upon his conscience.

'Oh, since it is a matter of conscience, Duncan,' said the good-natured minister, 'I will hear what it is.'

'Well, doctor,' said Duncan, 'the matter is this. Ye see the clock yonder on the new church. Now there is really no clock there, only the face of one; there is no truth there, only once in twelve hours; and in my mind that is wrong, very wrong, and quite against the conscience that there should be a lie on the face of the house of the Lord.'

The doctor promised to consider the matter. 'But,' said he, 'I'm glad to see ye looking so well, man. Ye're not young. I remember you for many years; but you have a fine head of hair still.'

'Eh, doctor!' exclaimed the unsuspecting Duncan, 'now ye're joking; it's long since I had my hair.'

Dr Macleod looked shocked, and answered in a tone of reproach: 'O Duncan, Duncan! are you going into the house of the Lord with a lie on your head?' He heard no more of the lie on the face of the church.

A well-merited repartee was dealt by a smart midshipman to the daughter of a K.C.B. at a ball given by the latter to the naval officers on the North Pacific station. The middy was bold enough to ask the young lady to accept him for her partner.

'Oh, dear no,' said the supercilious beauty. 'Ma never allows me to dance with midshipmen!' Somebody let her know the middy was a lord, and she repented, and by-and-by reminded him he was engaged to her for the next dance.

The youngster, however, was not so easily to be mollified, and remembering the lady had native blood in her veins, smilingly replied: 'Oh, dear no! Ma never allows me to dance with squaws!'

Said one play-going young fellow to another: 'I was at the Gaiety last night for the sixteenth time, and took a look round the pit to see if you were there.' But noways disconcerted by the insinuation, the subject of his 'chaff' retorted: 'What! Been so many times to the Gaiety, and

not know that you can't see the pit from the gallery ?'

Said a young Belgian attaché, vexed at being transferred from London to Washington : 'At all events, I shall speak no English in Washington. I learned it in London, and don't intend to spoil my accent.'

The remark travelled. At a Washington reception, a friend of the attaché asked an American belle to allow him to introduce the embryo diplomatist to her. 'I could not think of such a thing,' was the merry response. 'I learned my French in Paris, and cannot risk spoiling my accent by talking with a Belgian.'

The attaché was fairly paid in his own coin.

So was the Parisian dame who answering a wet-footed visitor's request for the loan of a pair of slippers, by saying : 'Certainly, my dear, if you think mine will fit you,' received the clever rejoinder : 'I daresay they will, dear, if you tell your maid to put a cork sole inside them.'

'You have given me Scotch whisky ; I asked for Irish,' complained a hurried imbibor.

'Never mind,' said the publican ; 'fancy it's Irish.'

The man drank up the liquor and made for the door.

'Stop!' cried Boniface ; 'you haven't paid me.'

'Never mind ; fancy I have !' said his customer, and away he went.

CIVILISATION IN POLYNESIA.

THE Sandwich Islands, in the Pacific Ocean, seem from all accounts to be advancing not only in material prosperity but in the arts of civilised life. Mrs Brassey, it will be remembered, says some kind things of these islands, which bask in an atmospheric paradise, but with the customary drawback of such paradises—an exuberant profusion of insect life. Mr W. M. Gibson, the American-born representative of Lahaina in the legislative assembly of the Sandwich Islands, while taking a holiday lately in the United States, embraced the opportunity of making his American friends acquainted with the charms of the land of his adoption—formerly a nest of savages, transformed into the well-ordered kingdom of a cultured monarch, with an enlightened legislature, and a loyal and law-abiding people.

Naturally enough, Mr Gibson paints the Assembly of which he is a prominent and popular member, in somewhat flattering colours ; but if the picture he draws is a reasonably true one, the Sandwich Islanders rejoice in a parliament which puts some of its older sisters to shame. Numbering but thirty-two members, of whom thirteen are white men, it does not, as such small assemblies are wont to do, waste its energies in party conflicts bringing about continual changes in the executive government. The legislators of Hawaii know their duty to their constituents better. Although the native element predominates so far as voting strength goes, the business of the House is virtually controlled by the white members,

the majority readily deferring to their views upon all matters wherein they think them likely to be the best informed ; and their trustfulness is not abused. 'There is no chicane, no serving of petty ends, only appeals to judgment and patriotism,' all working together harmoniously for the common weal.

Only seven per thousand islanders are unable to read and write, thanks to the abundance of excellent schools. English is the standard language, although the laws are printed both in English and Hawaiian. The latter, says our authority, will eventually die out. The Hawaiians, we are told, are a very musical people. King Kalakaua is not only a fine pianist but a composer as well ; and his sister, the Princess Lydia, is quite famous as a composer. After this it is not astonishing to hear that as regards social culture Honolulu is precisely like the best part of Boston or Philadelphia.

No longer 'remote from all that science traces, art invents, or inspiration teaches,' the Sandwich Islanders are well posted in what is going on in Europe and America. It would be difficult to find a head of a Kanaka family who is not a diligent newspaper reader ; many, not content with perusing one or more of the four journals printed in their own language, take in several English papers and American magazines. Says Mr Gibson : 'I would take a hundred labouring Kanakas and let them be brought in competition with a hundred farm-labourers from any state in the Union, and feel certain that in point of general information my hundred Kanakas would surpass your American farm-labourers.'

It were indeed to be deplored if a race that has taken so kindly to civilisation should be fated to die out. It is therefore gratifying to learn that the latest population returns indicate that the decay of the native race has been arrested ; a decay Mr Gibson ascribes to the practice of infanticide, which was once so common that it was neither concealed nor punished. Thanks to religious and educational influences, the Hawaiian matrons are beginning to feel a horror of the barbarous customs of the past, and there is consequently 'a turn in the tide of life of the Polynesian people.'

Another blot on the fair picture of this lovely land is leprosy or the Chinese disease, as it is called from those who introduced it. Attempts are being made to prevent the further spread of this terrible pest by isolating the lepers at Molokai, and the legislature has appropriated no less than seventeen thousand pounds to that end. This horrible disease, once contracted, defies all remedies. Ten or even twenty years may elapse before it results in death, but the end is inevitable. It is almost wholly confined to the brown race. Among six hundred and ninety lepers, only two whites were found ; one hailing from Cheshire, the other from New York ; 'and they were filthy depraved persons who had lived on most intimate intercourse with leprous people. The disease is not communicated by any such contagion as decent people are likely to be subjected to.'

The ambition of the Hawaiians is to make their islands an entrepôt for the commerce of the Pacific.

They have a line of steamers bringing them within seven days of San Francisco; they are laying a telegraph cable along their archipelago, as something towards a contemplated line to that port, and with an eye to the ultimate federation of the Polynesian Islands; for much as they admire England and the United States, they have no desire to relinquish their independence for the sake of the protection of either power.

In summing up the charms of these favoured islands, Mr Gibson says: 'In all my travels—which have extended pretty well over the globe—I have never found anywhere else so uniform and bland a climate or a more productive soil. Our temperature runs from fifty to sixty degrees in the morning and evening, to seventy and eighty degrees at noon. I have never known it to go below fifty-four or above eighty-six degrees. It is only semi-tropical, and there is no such climate anywhere for arresting the decay of the vital forces. The white man's energy does not diminish there. I think too the Sandwich Islands is the only place where you hear no cry of hard times. With us, capital is competing for labour, not labour seeking employment from capital. Good farm-hands readily command from fifteen to twenty dollars per month, with board. All sorts of mechanics are sure of employment at very remunerative wages, and living is cheap. Any man who has the energy to come that distance is certain of doing well. If he has anything in him, he will not be allowed to remain idle. When I went there, I had no means; but I started the growing of a grain-crop on the island which is still my home, where agriculture even in its simplest forms was unknown before; and the first year made eleven hundred dollars. Then I got some sheep, and introduced the Bermuda grass, invaluable for grazing purposes. Now, I have fifty thousand sheep, and the island will support as many more. We find a good market for the wool in Australia and Canada. I have done well in the Sandwich Islands, and any man who will apply himself to the endeavour can do likewise.'

LOST PROPERTY DEPARTMENT.

From a correspondent of the *Inverness Courier* we glean the following curious facts. He says: 'Most Londoners have heard of the Lost Property Department at the headquarters of the Metropolitan Police in Scotland Yard; but very few are aware of the magnitude of the transactions carried on there; and the report recently published in one of the daily newspapers of a visit to this museum of forgetfulness must have been a startling revelation even to the most ardent believer in the vastness of the Great City. It seems that on an average, one hundred articles are received there every day from cabmen whose honesty is sufficiently active to induce them to comply with that stipulation in their license which requires them to convey to the nearest police station any stray goods or chattels found in their vehicles. Not that virtue is left to be altogether its own reward; for if the property be claimed, the owner has to pay two shillings and sixpence or three shillings in the pound, which is handed over to the law-abiding coachman; and if no satisfactory application be made within three months, cabby becomes the legitimate possessor

of the "treasure-trove." It is said that the men as a rule, prefer to receive the reward rather than the article itself. And certainly, when it came to be the fourth umbrella or walking-stick or the third pair of spectacles, a smart young cabman might be excused for murmuring at the monotony of chance. But when it is a case of five hundred pounds in bank-notes, six hundred pounds-worth of watches, four hundred and seventy-six American gold eagles, or four thousand pounds in valuable securities, the requisite three months must seem to be a very long time to wait for a careless owner to put in an appearance. If the value of the property exceed ten pounds, the reward takes the shape of a lump sum fixed by the Commissioners of Police, in accordance with the particular circumstances of the case, and in a few instances ranging as high as one hundred pounds. Within the last twelve months, cabmen who are now plying for hire have received amounts in this way of twenty-five, fifty, and one hundred pounds.

'Some of the stories of forgetfulness thus brought to light are as curious as they are amusing. A hairdresser leaves behind him a bag containing all the materials of a modern *coiffure* and all the implements of his craft. A merchant forgets his cheque-book, a traveller his portmanteau, an invalid his box of pills, an actress her diamonds. Umbrellas, spectacles, opera-glasses, walking-sticks, muffs, pipes, even boots, all find their way to the Lost Property Department. Little wonder is it then that the total value of the "flotsam and jetsam" of this great sea of traffic was estimated last year to amount to fourteen thousand pounds.'

'WHEN ROSES ARE BLOOMING.'

A MAIDEN sat musing her bower within;
The roses were blooming, cream-white, crimson-red;
The maiden was young, and the maiden was fair,
And strange from such lips were the words that she said:

'Though lovers may woo me,
I ne'er will be won;
In vain shall they sue me;
Of love I'll have none.'

Now Cupid was lingering the bower within;
The roses were blooming, cream-white, crimson-red;
And slyly he smiled as he handled his bow,
And swore that a maiden so fair should be wed.

Soon a youth came awooing,
Both gentle and brave:
'Thou hast been my undoing;
Then, love, thou must save.'

Why trembles that maiden so proudly serene?
The roses were blooming, cream-white, crimson-red;
Why that flush on her cheek, and that quivering lip?
Why stands she so silent, with shy drooping head?

'Though lovers should woo me,
I vowed to be free;
But too well dost thou sue me;
I yield me to thee.'

EMS AND ITS SUMMER VISITORS.

NEARLY every one nowadays has been to Ems, that pretty little German spa, so celebrated some years back for its gaming-tables, and now for its hot and cold mineral waters, and for having been, till within the last troublous year or two, a favourite summer resort of continental royalty. It seems needless to describe a place so universally known; yet, for the few who have passed their lives quietly at home and who do not know Ems, we would say a few words descriptive of its beauties. It is situated in the duchy of Nassau, in the valley of the Lahn. The village, which is long and straggling, lies on the banks of the river Lahn; precipitous rocks ascend behind the houses on one side, and these again are backed up by pine-covered hills; while on the opposite bank of the river, tall hills arise, clothed with trees from their summit down almost to the water's edge. Beautiful villas stud the foreground; and all along the river are pleasure-grounds and shady walks beneath acacia and walnut trees.

Many English people go there as early as May, in order to avoid the extreme heat and the crowded season, which is June and July. The heat then is undoubtedly oppressive; but the cool air of the early morning is always inviting for exercise; and one can during the day find shade and repose in the spacious lofty reading-rooms of the *Kursaal*. The Act which after 1872 made gaming-tables unlawful, met with much approbation from the residents at Ems. Though to them the gaming-season was a golden harvest, the town being so crowded that the meanest lodging commanded a fabulous price, the winning gamblers recklessly spending their money in the purchase of jewels, dress, or anything they fancied for the time, and for which the merchants never failed to demand and receive large prices; yet we have frequently heard them declare they preferred to forego their gains, than have the place overrun by gamblers.

During the summer we spent, several years ago, at Ems, while at breakfast every morning at the

Vier Zeitung Hotel, the tall figure of the Russian Emperor strode past the window on his way to drink at the *kranken Brunnen* in the *Kurhaus*. He went quite unattended, save for the companionship of a large black retriever, of which he was very fond. To see him casually, one might think there were no Nihilists to be feared, that his life was easy and secure; but on a closer observation, if ever a face expressed 'Uneasy is the head that wears a crown,' that face is the Emperor Alexander's. There is something inexpressibly interesting about him. He is a noble-looking man, with the air of a sovereign; but his weary careworn expression could not fail to excite the warmest sympathy. Although going about Ems with such apparent confidence and security, the town was full of Russian detectives in plain clothes, keeping watch in every direction over the safety of their monarch. Notwithstanding their vigilance, however, some ill-disposed person struck the Emperor's pet the black retriever a blow across the back, almost killing the poor animal; and for many days after this cowardly act he was unable to accompany his master in his morning walks.

There could be no greater contrast than that which the German Emperor presented to his nephew of Russia. Always going about amongst the people, jovial, good-humoured, and full of gay spirits, his subjects actually idolised the very ground he trod on. Wherever you saw the old gentleman walking along, with seldom more than one attendant, you saw every one start up to salute him, as if the sight was new, and with the warmth of their hearts beaming in their eyes; while he kept shaking his stick at them, requesting them to 'sit down; put on your hats; sit down.'

We well remember the first time we saw the German Emperor. Returning one day from a walk, we observed a crowd of people in the promenade, standing at a short distance from, and watching an elderly gentleman talking to a very pretty girl. The girl kept courtesying backwards, retreating a step each time. The Emperor William—for he it was—followed her up, making-

believe to bore a hole at her with his walking-stick. The whole scene had a most ludicrous effect, but was highly characteristic, and indicative of the friendliness that existed between him and his people.

Another day, a large party of schoolboys, headed by their master, arrived at Ems to spend a holiday. After exploring the town and drinking the waters, they came trooping along the covered colonnade which forms one side of the Restaurant Gardens, and which is itself lined with stalls belonging to the larger shops in the town. The Emperor walking quietly along in the opposite direction, accosted the foremost boys, saying: 'What brought you here, my lads?'

'We came to spend a holiday and to see the Emperor,' promptly replied their spokesman.

'To see the Emperor! Then have a good look at him!' rejoined the monarch, turning himself round back and front. 'I am the Emperor!' And forthwith he took the delighted boys to a book-stall close by, and presented each of them with a photograph of himself.

One morning there was considerable excitement at the *Vier Zeitung*, waiters rushing in all directions, and Herr Huyn our little host looking fussy and all-important. We inquired the cause, and were told that the Emperor was expected in the afternoon to call upon some ladies of high rank who were staying at the hotel. A huge roll of new carpet which had just been brought in was to be laid down on the grand staircase, and flowers were to be scattered in profusion everywhere. All the forenoon poor little Herr Huyn was in a pitiable state. He did not like to lay down his beautiful carpet, and have its freshness sullied by the numerous feet passing continually up and down the grand staircase; and yet he was in a considerable fright lest he might not have all ready in time when the Emperor should be seen approaching. Waiters acting as scouts were continually running in and out and peering up and down the street. It was a never-ending refrain of, 'Sister Anne, Sister Anne, do you see any one coming?' At last a horror-stricken waiter came rushing from the corridor above us, exclaiming: 'The Emperor is here! He is at this moment in the *salon* of Madame la Princesse!'

Herr Huyn stood aghast. 'How did he get there? When did he come?'

Alas! it was discovered that the Emperor coming quietly and unattended, had turned in at the entry to the baths, gone up an uncarpeted back staircase leading from the court, inquired his way from the astonished servant to the Princess's rooms, and so stolen a march on our poor crestfallen little host.

There was nothing now to be done but carry carpet and flowers round to the back staircase, and spread the one and scatter the others as rapidly as possible. This done, Herr Huyn kept guard at the foot of the stairs, still uneasy lest, through a combination of untoward circumstances, the Emperor might now make his exit by the front entrance, and so, after all, never know of the preparations made to do him honour. However, at last he was heard approaching, accompanied by the Princess. At once noticing the change, he inquired: 'For whom has all this trouble been gone to?'

'For you, sire!' returned little Herr Huyn reverently.

'Alas!' said the Emperor, 'it is a pity to leave such lovely flowers to be trodden on by an old man like me.' And stooping, he selected some of the most beautiful, and presented them to the Princess, and then fastened a blossom in his own coat. Such was the graceful acknowledgment he made to Herr Huyn, and by such simple acts did he daily endear himself to his people.

Prince and Princess Frederick-Charles with their daughters came one day to call upon the Emperors; amongst them was our own Duchess of Connaught. We recollect thinking how rude the people were, staring at the royal party as they sat sipping coffee in front of the *Kursaal*, each spoonful being eagerly watched from the time it left the cup until it disappeared down a princely throat. We too might have stared as earnestly, could we have foreseen that the slight graceful girl dressed in the palest shade of lilac, with a gauzy white bonnet, was to be in after-years one of England's daughters. Later in the afternoon they met the Emperor Alexander in the promenade; and after the interview, at which all Ems assisted at a distance, the Czar remained sitting alone on the *banquette* where he had been conversing with the Princess Frederick-Charles. Presently, out of the crowd and contrary to all etiquette came an old man, dressed very peculiarly in drab clothes, with knee-breeches and gaiters, a large muffler concealing much of his face, blue spectacles, and a broad-brimmed hat. He walked deliberately on until he came opposite to the Czar, stopped within a yard or less in front of His Majesty, and began thoroughly scrutinising him. He then went from side to side, looking at him from every aspect. The Emperor never moved a muscle. The crowd did not know whether to laugh or be indignant. Presently the old man moved off; but before going many paces, he returned, apparently not yet satisfied; and after again taking a side-view of the Czar, he actually walked round on the grass close behind him, and remained gazing at his back for more than a minute. Yet the Emperor never flinched, or made the least sign that showed he was aware of his presence. And yet how unpleasant the position. The man might have been an assassin, his very peculiar dress simply a disguise. More daring attempts on life have been often made; for instance the shameful outrage which occurred in the Winter Gardens of St Petersburg so short a time since; and at all events, even to an ordinary individual it could not fail to give a disagreeable creeping sensation in the spinal marrow to feel that some one with unknown intentions was closely contemplating their back. However, curiosity appeared to have been the motive that prompted this old fellow's extraordinary behaviour; for having gazed his fill, he walked off, every now and then turning to take a parting look.

Never shall we forget the smile of mingled relief and amusement that overspread the Emperor's features as he turned to the people, who had been silent yet anxious spectators of the scene.

Many are the interesting and celebrated characters besides royalty to be met with at Ems. In a walk through that gay promenade, if you are fortunate enough to be with some intelligent foreigner, he will point out to you celebrities of all kinds, such as Herr Krupp, tall, stately, with his high forehead and intellectual face; the

rugged old commander-in-chief of the Cossacks, and his wild unkempt-looking son, whose names, celebrated though they be in the annals of Russian warfare, we could not attempt to pronounce, much less to spell; and the last new singer, come for rest, and to prove the virtue supposed to be possessed by the waters of Ems for strengthening the throat and chest. Every evening at the *Vier Zeitung* we used to enjoy the most delicious music from some Parisian Opera singers who were staying there. One in particular, a Madame C—, though rather *passée* as to her voice, afforded us much amusement. She was most anxious to make a youthful appearance, and her complexion was in itself a miracle of art; while she wore her hair, a lovely golden colour, in the most juvenile fashion, with a number of small ringlets across her forehead. One night at the theatre she was amongst the audience, when feeling the heat oppressive, she removed her veil. In doing so alas! the band of golden curls became entangled, and was removed also, exposing to view some coarse and grizzled hair; while to every one's infinite amusement, the yellow locks dangled for the rest of the evening on her shoulder; and she, unconscious, coquetted away with her cavalier—who was too polite to tell her—as if she had been a beautiful girl of sixteen.

Every one who goes abroad of course enjoys himself after his own fashion, and it is presumptuous in one to dictate to another; but one cannot help being struck with the fact all the same, that the English lose half the benefit of the complete change of ideas they might otherwise enjoy, if they could for the time leave behind them some of their intense insular respectability; and when they go to Rome, do as Rome does. They like to go to the hotels frequented by the English, because they think them more respectable, and because perhaps they get a few more of the luxuries they are used to at home; and no one can help remarking the sort of wet-blanket with which a number of English will envelop the *table-d'hôte* of an hotel mostly occupied by foreigners. During the meal, every one is dreadfully well-behaved, a few little commonplace platitudes only being exchanged; but when the English get up and retire, which they usually do with one accord, it is as if school-hour was over, tongues are loosed, and gaiety and merriment are the order of the day. At such places as Ems and the various bathing-springs abroad, acquaintances are easily formed. Even if they are not always unexceptionable, they serve to pass the time; and when you leave, you are not likely ever to meet your friends of the summer again. But even in this the English are so guarded, that they spoil their own enjoyment. We remember walking one evening with an English lady of large means and good position; a gentleman raised his hat to us.

'Who is that?' she inquired.

'Count L—,' we replied. 'He is a Russian, and attached to the Emperor's suite.'

'O dear, how provoking!' was her comment. 'I dropped my handkerchief the other day, and he stepped forward and picked it up, as it had fallen where I could not reach it. Next morning, when I met him, he raised his hat; but of course I looked another way, as we had not been introduced. I never dreamt he was Count L—.'

It seemed to us that our countrypeople were

always complaining of the dullness of Ems. We did not find it so. Our corner at the *table-d'hôte*, where the same party always met, was the gayest of those long tables. Flowers and fruit were every day found beside our breakfast-plate, the graceful morning gifts of our numerous foreign friends. Expeditions on foot, on mule-back or in carriages, were frequently on the *tapis*, and the evenings we shall always remember with pleasure. When unoccupied by theatre or opera or the amusing dances in the *Kursaal*, the walks through the perfumed gardens, often alight with fire-flies, the band playing soft music, the balmy air of the sweet summer night, a pleasant companion, and a desire to enjoy, without grumbling, the good gifts of this life as they came, made in all a combination so pleasant as not to be easily forgotten.

YOUNG LORD PENRITH.

CHAPTER XXXVI.—AT HOLLOW OAK STATION.

It was dark when Hugh Ashton, stepping from the second-class carriage in which he had travelled from London, alighted on the low brick platform of Hollow Oak Station. Only two or three other passengers got out there, and they were apparently natives of the place; for the porters in attendance greeted them with a growl and a nod, such as in agricultural districts pass current as a polite form of salutation to an acquaintance. But they looked at Hugh with some curiosity, as if marvelling who he might be; and when the steam whistle had sounded, and the train jarred and jolted itself again into motion, like some slow-moving stream of sluggish lava on a mountain side, the most intelligent of them touched his cap slightly, saying: 'Going anywheres, sir, near here?'

'No,' answered Hugh, smiling. 'I am going to stay where I am. You, I suppose, are the head-porter, and I daresay are in charge of the keys?'

'Our new station-master, sir? I thought as much,' said the man civilly, and again touching his official cap in recognition of his superior. 'I've got the keys handy, sir; and if you'll just step across'—

Under the porter's guidance, Hugh crossed the rails, and gained the little wooden platform, screened by the buildings of the station, which corresponded to the little brick platform on the down side. There was a sleepy air about the tiny booking-office, and the tinier waiting-room, and the very clock ticked drowsily, as if its constitution, town-made article though it was, had been affected by the somnolent influences of the place.

The station-master's house, of red brick, like the rest of the buildings, stood a little apart from the business part of the premises, and was trim and in good repair, as such edifices, the property of a wealthy Company, usually are. A creeper, the leafless tendrils of which looked withered and bare, but which waited for the touch of the vernal sun to put forth leaf and bud again, had been carefully trained over the front. The head-porter unlocked the door, and acted as cicerone in exhibiting the four rooms and a kitchen of which the tenement consisted. There

was furniture, of the sort that is put in by contract, and calculated, very properly, to be durable rather than ornamental. There were coals, and there were lamps, gas being, at Hollow Oak, a non-existent source of illumination. The porter bustled about to trim and light a lamp, and to kindle a fire in the chilled parlour grate.

'Mrs Waite—Mother Waite we call her, mostly—the old woman who did the work for the last station-master, who happened to be unmarried—I suppose like yourself, sir—lives hard by, at this end of the village. A respectable, tidy old soul she is, if you'd like me to give her a call in?'

Hugh thanked the man, who seemed to be a good specimen of the railway servant on his promotion, and expressed himself as willing to retain the services of the tidy Mrs Waite.

'I feel new and strange here,' he said. 'And a ship's deck has been more familiar to me, hitherto, than the plank platform of a railway station. Is there anything I ought to do, as a matter of duty, to-night?'

'Nothing worth mentioning, sir,' the porter said. 'It might be as well, for the sake of practice, to look out, and see all clear, when the night express goes by—and so with the up-mail. Never mind the heavy train at 9.45. I'll attend to that, as I have done this fortnight past, since Mr Weeks left. And then there's the locking-up. And that will be about all. But, since it's late, and there's nothing ready in the house, perhaps your best way, sir, would be to get a bit of supper at the *Beville Arms*.'

Hugh could not repress a slight start at the mention of the name. 'Why, *Beville Arms*? ' he asked, in a tone of assumed carelessness.

'On account of my lord, sir,' returned the porter, with some surprise. 'I forgot,' he added, 'you were a stranger here. I mean my Lord Penrith. Most about here belongs to him, and you can see his grand house, Alfringham, on a clear day, from the ridge a mile off from where we stand. That's why it's the *Beville Arms*, sir.'

Hugh made no further remark, but quietly proceeded to take the porter's sensible advice, hiring the experienced Mrs Waite to undertake the charge of his modest housekeeping, ordering the inevitable mutton-chop and potatoes, which the neat public-house of the hamlet—over the door of which creaked the signboard painted with the *Beville* coat-of-arms—was competent to supply, and presently addressed himself to acquiring by examination of the printed rules and time-tables some knowledge of the duties that devolved upon him in his new capacity.

'How strange,' muttered Hugh to himself, when at length he laid his head upon the pillow of the make-shift bed which tidy Dame Waite had hastily prepared for him—'how strange that, of all places in the world, the hand of Fate should have led me *here*! The name of Hollow Oak Station at first suggested nothing to my memory or to my fancy. But Alfringham? Surely it cannot be for nothing that Mr Dicker's good-nature has consigned me to this out-of-the-way spot. Surely there must be something more than mere coincidence in the fact that I, of all men living, have been suddenly transferred to this place, of all places in the south of England. I feel as though I were groping and stumbling through darkness along a rugged road, and yet

with a vague confidence that I should reach the goal at last.'

By the first gleam of the cold gray winter's dawn, Hugh Ashton, an early riser always, as sailors and colonists commonly are, was astir. The station, when he emerged from his own little solitary dwelling, and stood alone on the platform, looked ghostly and cheerless enough; and yet, as the wintry sun struggled through the broken clouds, he could see that in summer at least the place must be lacking in few of the elements of silvan beauty. Even the deep cutting within sight had its steep banks thickly planted—perhaps through the care of some floricultural station-master departed—with rhododendrons, that in due season must carpet the slopes with gay colour. The country around was broken and undulating, and studded here and there with dark copses of holly and ash, or with clumps of fine trees—relics, it may be, of the primeval forest that Canute first, and William after, enlarged and meted out as a Royal Chase.

'I am glad, for more reasons than one, that I am here,' said Hugh to himself. 'My station would have pleased me less had it been among the fat pastures of Leicestershire, or perhaps among the bulrushes and endless windmills of the fen country in the far east.'

It was not, to all appearance, a very bustling career which lay before Hugh Ashton at Hollow Oak. Edmunds, the civil head-porter, who, as a native of the village, though a travelled one, felt bound to say a good word for the borders of the New Forest and all things thereunto appertaining, described the work to be done at Hugh's new station as easy in the extreme. 'Business hereabouts is slack,' he said, apologetically for the quiet that prevailed. 'But in truth, sir, there's never much of it. No mineral traffic, no manufactures, you see. A timber-train now and then, going to some dockyard, or a cattle-train bound for London, we may have; but that's about all.'

Everything was neat and orderly, on a small scale, at Hollow Oak. A slim stripling in uniform sat in his narrow den, full of coils of copper wire, and clock-faces marked with cabalistic characters, and all the miscellaneous properties of a telegraph office, listening, so it seemed, as necromancers of old hearkened to the whisperings of some familiar demon, to the sharp click, click of the mystic little needles that trembled ever, stirred by the unseen subtle influence many a mile away. The porters went about their duty as demurely as though their business had lain in the starting—every axle tapped, and every flange examined—of the 'Flying Scotchman' or the 'Wild Irishman' on its rush of rocket-like swiftness, with a cargo of valuable lives, to Holyhead or Edinburgh. The ticket-clerk was but a boy, but sedate and smart; and the only confessed loungee was the green-coated railway policeman, who seemed to have nothing to do but to brighten his buttons and tighten his belt.

There was, after all, a queer resemblance between a station and a ship, which, after a little while, suggested itself to Hugh Ashton, and tended to reconcile him to his new duties. There was for the station-master the same round of routine cares, the same sense of daily and hourly responsibility, that there is for the captain. The

work might be a trifle more mechanical, the nerves were not braced by the sharp but wholesome tonic of sea-danger; but the similarity seemed to Hugh beyond dispute. He had his watches now to keep, on account of the night-trains, as he had done many a time at sea. He had even his own deck to walk, in the shape of a boarded platform which, however, was neither tight enough nor clean enough, through constant holystoning and the free use of broom and mop, to please a sailor's eye.

'He'll be a good station-master—better by long chalks than old Weeks—but somehow those seafaring chaps can turn their hands to most trades,' said Edmunds the porter, in the taproom of the *Beville Arms*. And here it may be noted that Edmunds, though a good head-porter, and hopeful of promotion, never expected to take such a leap up the ladder of advancement as to become in his own person a station-master. Such functionaries are commissioned officers in the Railway army; whereas porters are likely to rise no higher than does, in a parallel line of life, some sergeant-major, staff or regimental, who is respected in the service, and fairly well off, but who will rise no more.

There was leisure enough, Hugh found, at Hollow Oak. Highly salaried masters of important stations in great commercial centres might be half distracted by the incessant calls on their attention; but at that haven of repose the commandant of the little garrison of railway servants had time to ride a hobby of his own, be the same butterfly-hunting or pigeon-fancying, gardening or authorship. The country, as has been said, was pretty, and in parts wild, lying as it did on the confines of the New Forest.

'They call us Hollow Oak, Mr Ashton,' said the explanatory Edmunds, glad of a new listener, 'because of the Oak itself, five hundred yards, as the crow flies, from Hollow Oak churchyard, on the crest of the Ridge. There it stands, the grand old tree, a mere shell now; but a goodish lot of people could stand inside. It's been printed about, it has, in many books, and many learned gents come to see it. If it wasn't standing, as I daresay it was, when Julius Caesar came, I'll be sworn it was when Rufus came to die of the arrow. It's been hollow this many a year; but'—

'But what?' asked Hugh, as his informant hesitated.

'They do call it the Haunted Oak, as well,' answered Edmunds, dropping his voice. 'Anyhow, odd sounds are heard, and folks keep clear of it on a dark night.'

'Does not the Ridge, as you call it, on which the Oak stands, overlook the Bullbury Road?' asked Hugh suddenly.

'It does. You've read of it, sir, belike?' replied the porter.

'And is there not a place, between the Ridge and a brook, called—let me see—Calder Brook—a place called Lambert's Stile?'

'Murder Stile, we always call it now, sir, or else Bloody Stile, ever since one of my Lord Penrith's sons shot the other beside it, five-and-twenty years ago, or more.'

'I have heard the story,' answered Hugh calmly. 'When I have time, I will stroll out and see the place.'

CHAPTER XXXVII.—IN PERIL.

'This, then, must be the place where the fatal deed was done. It has been often in my thoughts—so often, that it is difficult to believe that these eyes of mine behold it for the first time.' So soliloquised Hugh Ashton, as he stood beside a stile giving access to a field across which a foot-path led, in the direction of the wooded Ridge. Behind him was the narrow country road leading, as a moss-grown old finger-post declared, to Bullbury, Mepham, and Greenend. The field through which the path wound was rush-grown pasture-land, shut in by a huge thorny hedge and tall bank overgrown with giant fern. The stile itself was, to look upon, merely an ugly hog-backed stile, of brown oak, with stepping-stones worn with age and use, and which would have been voted an awkward obstacle by even the most intrepid of fox-hunters. Such as it was, Hugh Ashton stood gazing at it long and fixedly.

'Lambert's Stile?' said a little crowboy, who now came past, in answer to an inquiry on Hugh's part. 'Not as I knows on, master. Bloody Stile, this one is.' And the urchin went slowly back from his dinner to his work, without manifesting any inquisitiveness as to Hugh himself, or the motive of his question.

Hugh Ashton drew a deep breath, and surveyed the spot as if resolved to imprint every local detail indelibly upon his memory. 'From behind yonder hedge,' he said, 'tall, and old, and fern-grown, doubtless, even a quarter of a century ago, the fatal shot was fired. There, no doubt, the assassin crouched amid the fern and brambles, awaiting the coming of his victim. I can fancy Marmaduke Beville, wilful, headstrong, careless of danger, advancing along the path without a thought of the violent death that was so near. It was sudden, terribly sudden! I can see the flash of the gun, and see the blue smoke curl upwards from amidst the fern, and the man that fired the shot— Ah! if I could but drag him to justice, in the open light of day, and right the cruel wrong that has endured so long, and wrecked a nobler life than his who died that day!'

There seemed to be a hideous fascination about the ill-omened spot, for it was difficult for Hugh to tear himself away. He did not actually, however, cross the stile or strike into the footpath, but avoided both with an involuntary repugnance that his reason could not conquer. He went on along the Bullbury Road for some distance, until at last he reached a narrow lane, bordered by ragged hedges, which evidently led towards the Ridge. A few minutes of brisk walking brought him to the verge of a belt of woodland, through which a track, available for foot-passengers, led. Hugh struck into this path; and presently emerged upon the very crest of the Ridge itself, a long chain of low hills, wooded yet as to its sides, but on the highest portion of which the trees had fallen beneath the axe, leaving but a tangled mass of shrubs and brushwood, where once the towering elm and spreading beech had lifted their proud heads sunwards.

Hugh took a steady survey of the wintry landscape, new to him, yet by report so strangely familiar! He could have made a shrewd guess at the real names of more than one of the landmarks, unseen before, that met his gaze. That

clump of fir-trees, rising black against the sky, must be Scranny Holt, famous for its fox-earths; and yonder waste Cheam Common, where a battle had taken place between Royalists and Round-heads early in the Civil War. And that grand house, on whose many windows the sun threw a gleam of pale gold, standing amongst hereditary oaks of mighty growth, with its park stretching miles away, and its mass of buildings suggesting the proportions less of a mansion than of a palace, could be no other than stately Alfringham.

Alfringham! Hugh's heart beat high for a moment, and his eyes glistened as he caught the first glimpse of the majestic pile of which he had heard so much, beneath very different skies, and in the midst of a very different vegetation, from those on which he now looked.

'And to think that a word from me would'—Thus much he said; but he did not complete the sentence, and with a cold, proud smile, turned away. He did not throw another glance towards magnificent Alfringham, but rambled on, nearer and nearer to where, like a wall, rose up on the horizon's edge the girdling belt of trees that marked the edge of the Forest. It was a desolate, but in some respects not an uninviting landscape on which he looked. He had turned his back on the fertile vale reaching to Bullbury and far beyond, which formed the most profitable portion of Lord Penrith's estate, and what he saw before him was a wild and picturesque tract, where half-savage herds of ponies cropped the short herbage of some heath; or peat-cutters could be distinguished far away plying their trade beside a swamp, reed-crested; where patches of woodland were frequent, and few indeed the thatched roofs and wreaths of smoke that indicated human abodes.

More and more did the country resemble a wilderness as Hugh Ashton approached the boundary of the Royal Chase. There had fallen on the previous night a sprinkling of snow, which on the upland remained, unthawed by the pale sun, and crackled crisply beneath his feet as he advanced, pushing his way through stunted heather and lofty fern, until, from a neighbouring thicket of underwood, overtopped by three or four old trees that the lopping axe had spared, the smothered sound of voices reached his ear. He pressed on, pushing aside the nut-boughs as he came forward, and burst into a clearing almost entirely shut in by bushes and golden-blossomed gorse, and there beheld an unaccustomed sight. On the ground, its sinewy limbs entangled in a net, lay a noble stag, gasping, and feebly struggling still to rise, while the blood streamed fast from its throat. Over the prostrate animal knelt two swarthy fellows, whose olive skins, long hair, and glittering black eyes left no doubt as to their caste, one of whom was firmly grasping the antlers of the dying stag, while the other held in his hand a curious sort of a knife, with a broad blade and a carved handle. Two others of the tribe who, leaning against the trunk of a scathed wych-elm, were surveying with much interest the proceedings of their brethren, started, as they heard the dry leaves and snow crackle beneath Hugh's step.

'A spy! a spy!' they exclaimed. 'Ware! Ishmael!' And the man with the knife turned his head and saw Hugh Ashton within a few feet of him.

'So much the worse for the Busne, if he's alone!' muttered Ishmael, scrambling up and clutching the knife more firmly.

Hugh took in the situation—none of the pleasantest, it must be admitted—at a glance. The sight of the deer—escaped no doubt from the limits of the Royal Forest, if indeed those boundaries did not include the place on which he stood—dying on the ground, of the gipsy crew around, of the net and the knife, told its own tale. The wanderers had been busy in securing to themselves, as dwellers in and near the New Forest were till recently wont to do, an illicit share of those rights of vert and venison which are by statute and common law the exclusive property of the Crown. And there was no mistaking the character of the unfriendly glances which those whom he had disturbed in the course of their poaching transaction threw towards him, the intruder on a region which they probably considered as their own hunting-ground.

'Come, come!' Hugh called out in his clear deep voice; 'I am no keeper, my lads, or ranger, whichever they call it, so I have no wish to interfere with you, unless— Ah, my fine fellow, I can't stand that!' he added, less amicably, as a lithe, long-haired stripling, the youngest of the group, stole round and aimed a blow at Hugh's head with the butt-end of a rusty and short-barrelled gun. And before the young gipsy could repeat the stroke, cleverly eluded, the gun was wrenched from his grasp, and that with a force that sent him staggering into the midst of his friends. Ishmael, who seemed the strongest and most resolute of the party, came forward, knife in hand. The others clutched their heavy sticks. One and all had the aspect of wild-cats brought to bay. A male gipsy, as many of us can avouch, is apt to present a singular example of how a savage nature can be kept in check by the constant presence of a civilisation that it abhors and rejects. He is sometimes sullen, not seldom orientally abject in his attempts to please. He is useful too in a spasmodic way, and will get through a job of work, if mending be required, with a patient deftness that regular European workmen do not equal. But you can never quite trust him, and you never know when the vindictive spirit of his lawless ancestors may make itself felt. These gipsies, caught red-handed beside a slain deer, were desperate.

'There's nothing in the gun!' exclaimed the man who was called Ishmael; 'rush the Gorgio!' And he himself set the example by bounding forward, flourishing his knife. To Hugh, the information that the piece which he had captured was unloaded, was an unwelcome one; but he clubbed the gun, and setting his back against a tree, prepared for the worst. The fiercest, as well as the strongest, of the long-haired crew was plainly Ishmael, who now commenced the attack, brandishing the knife with which he had despatched the deer. But Hugh had had to do with those who trusted to such weapons before that day; and he had Ishmael by the wrist, and had struck the knife out of his hand, before the gipsy could well realise the fact that he had met with more than his match. The others, however, were closing in, and the unequal scuffle could not have been long sustained, had not a weird female form flitted, spectral, from behind the trees, uttering

words in a strange tongue, the sound of which produced an instant effect upon the gipsies, for they suspended their attack as though spell-bound.

Hugh had not much difficulty in recognising his rescuer. It was Ghost Nan, the wild, roving mendicant whom he had seen in Cornwall, and for whom he had hitherto sought in vain—the half-crazed gipsy who had threatened and alarmed Maud Stanhope within rifle-shot of Lady Larpent's gates. She stepped forward now, with the air and bearing of a queen, between Hugh and his scowling assailants.

'Lay not a finger on the Gorgio!' she said. 'Seek not to harm a hair of his head, a shred of his garments, unless ye would have the hand ye lift dry and wither, and the eyes grow dim, and the feet pine and perish and grow feeble and frail, within the stone walls of Dorchester Jail. He is charmed, fools! charmed from hurt or ill, until his allotted task be done! Think ye, but for that, that he would ever have come here?'

The words were strange and fraught with mystic meaning, or a madwoman's frantic fancies, as the listeners chose to take them. There was no doubt as to the impression produced upon the gipsies around. They laid aside their threatening aspect, lowered the bludgeons which had been brandished menacingly enough, and slunk off, one by one, like wolves surprised by the daylight in the outskirts of a town. Hugh remained alone, beside the dead stag, confronting the singular woman who had come between him and his foes.

'I have wished to see you more than once,' said Hugh earnestly, 'dame, since you and I met at Treport. You seemed then to fancy that you knew me.'

'I took you for your father!' answered Ghost Nan, with a grim laugh. 'Once you scared me, young man, but now I know better. You cannot call the dead to life, can you? Even I cannot do that!' she added frantically.

Hugh thought that he saw the gleam of insanity in the haggard eyes that this strange woman fixed upon his face.

'If you can,' resumed the gipsy, after a pause, 'go down to Bloody Stile, where I saw you stand to-day, and try your power! Marmaduke Beville, he that died there, and left the place its evil name, should surely rise, if the dead can rise, at your command. Or perhaps the heavy marble of his tomb, the heavy lead of his coffin, may keep him down, ha, ha! and make him deaf to your voice. I saw the funeral pass down the park at Alfringham, a goodly show—and I bethought me of how still and low he lay, on the grass, among the nettles and the kingfern!'

'Woman, you madden me! For heaven's sake, you who know so much, tell me, do you know all? Were you present, or near to the accursed spot, when the foul deed was done? And if so, who was the treacherous villain who contrived to fling the blame of his coward crime upon one innocent, who?'

'Ha, ha! son of the Red Hand!' interrupted Ghost Nan, with her shrill, ghastly laugh; 'would you fain bring a murderer's neck at last to the hempen cord that has long been waiting? Well—it is your star has drawn you here; and if your star prevail over *his*, the truth may yet be known. Meet me, if you will, beside the

Hollow Oak, at moonrise, on the third night from this.'

'I will not fail,' said Hugh; but already Ghost Nan had glided away, as if she had been a ghost indeed, and was lost among the trees and bushes; while Hugh, with a throbbing heart and busy brain, walked back to the scene of his new duties at the railway station under his charge.

(To be continued.)

EAST-END EXPERIENCES.

WINTER, which has had such a persistent reign this year, has been productive of terrible scenes of pinching cold and destitution in some parts of the east end of the metropolis. The casual wards of the workhouses were every night filled of course to repletion; and despite the severe weather, the number of persons of either sex who were compelled to walk the streets every night in default of a lodging was heart-rending.

Let us see how these people exist with no employment, with everything going out, and nothing coming in. Exist they certainly do by some incomprehensible process. Let us visit one or two of them in the hovels where they reside, merely premising that a decently dressed person is seldom allowed to take such a liberty with them. Being confident, however, that we shall be welcomed, we dive down a narrow court, through the half-open door of a miserable two-storied house, in a locality where, but that we happen to be acquainted with the occupant, we would not care much to venture by day, and in which we certainly would not be found at night. Up-stairs, unannounced we come to the room occupied by Mr King, a short, shrivelled-up old man of sixty-five, but who earns a good deal of money at the wharfs and docks in the summer. Mr King's room is his castle, and from it he carefully excludes such city missionaries or district visitors as care to venture near him, even when he is in the greatest distress. But if anybody knows him at his work, or is say his foreman or 'gunger,' Mr King will open the door to him immediately. Entering, we perceive him squatting on the apology for a bed that lies on the floor beside a scrap of fire, his face resting in his hands; while opposite him, in a backless chair, sits a young gentleman chewing a piece of string, and fancying it is tobacco. We recognise them both, and are saluted with a 'Well, captain!' simultaneously. Mr King's *vis-à-vis* has a name of course, but we never knew it, for he is known only by the *sobriquet* of 'Taters' by everybody. The room is plentifully hung with some rather tattered linen in a dubious state of cleanliness, and this is some 'family washing' which Mr King's wife takes in, and is at present completing, iron in hand. Amidst the steaming linen we take a seat in the backless chair, the oscillatory movements of which we are constantly compelled to steady with our legs, the polite 'Taters' in the meanwhile taking a seat on the bed beside Mr King. Well! how have things been going with him? Oh, very bad indeed! no work, not a stroke for the last

six weeks. Yesterday, all he and the 'old woman' had was half a quartern of bread; and he gave a piece of that to 'Taters,' who had called to beg some, as he had not broken his fast for twenty-four hours.

They have had no breakfast this morning, and it is now ten o'clock, and they were both too faint to go out and look for work. What Mr King now lives upon is what the 'old woman' gets by washing, but there is scarcely any of that to be had; and he should not have been so badly off, only the landlord of the public-house where his 'money club' was held, ran away, and so he lost about four pounds he had saved in the summer.—Then why did he not put his money in the Post-office Savings-bank? Oh, too much humbug and bother about that.—Had he applied to the parish for any relief? Well, he thought we had more sense than to ask him such a question as that. We knew very well that unless he went into the 'house' altogether, all he could get would be a meal of food for himself in return for a task of stone-breaking, but he could bring none of his earnings home. As for 'Taters,' he was a single man, and had no business to come sponging on Mr King; but that was like him, for he always spent his money at the public-house when he had any.—Did Mr King owe any rent? Yes; he owed ever so much, and was besides in debt at the baker's and grocer's nearly two pounds.

Honoured as we were by admittance to Mr King's domicile, we felt constrained to offer him a couple of shillings by way of loan, a sum he would have rejected, had it been offered as a gift by his parish clergyman. Smilingly and with eyes dilated, Mr King takes the coin, and at once hurries off, returning shortly with some bread and cheese, tea and tobacco. The tobacco, singularly enough, is attacked first with wolfish ferocity; and the pair having feasted on the bread, express their conviction that 'the captain is not a bad sort after all.' The meal half-finished, we startle them with the intelligence—which we have purposely till now withheld—that the ship *Gamboola* is going up to dock with forty-five thousand bags to land. Up they start as if struck by an electric shock, and with a 'Good luck to you for the news, captain!' hastily pocket the remainder of the bread and tobacco, and scuttle away down the stairs as fast as their legs can carry them. Left alone with the 'old woman,' we extract from that lady that her husband is stupid, and stands very much in his own light; but that for her part she is not so squeamish, frequently obtaining, unknown to him, tickets for bread and coal from the charitable.

Bad as things were with Mr King, there were a few cases where they were worse—cases of families huddling together in a state of starvation and semi-nudity; but such instances were not numerous, as the poor readily assist each other, and but few deaths occurred during the winter from actual want. Passing along a large thoroughfare one bitterly cold night, we were accosted by a respectable, though shabbily dressed man, who with husky voice implored us to purchase of him a small pocket-knife to enable him to pay for a lodging. He was a professor of languages, and an excellent musician to boot, but had walked the streets three nights consecutively,

picking up by day a crust of bread occasionally from some charitable baker. The knife became our property; and with the purchase we threw in a few hints for his guidance, which we are glad to say proved useful, as when we met him about three weeks afterwards, he informed us that his circumstances had slightly improved.

Along the wide expanse of the Mile End Road we find some large Assembly Halls abutting upon the main thoroughfare, where evangelistic services are constantly held all the year round, interspersed with lectures, magic-lantern exhibitions, and other entertainments likely to interest the masses of the people. The most commodious and useful of these is one erected by the promoters of the Tower Hamlets mission; and here there is every variety of preacher, from the Oxford man down to the converted pugilist. During the severest part of the winter, a gentleman connected with the mission voluntarily distributed some bread to a few who were in need; and in the course of a few days the number of applicants had increased so much, that the hall, capable of accommodating about fifteen hundred people, was transformed into a 'draw,' being filled three evenings every week by a hungry crowd of men, women, and children, each of whom received a large piece of bread and a pint of cocoa; the money to provide which was chiefly supplied by readers of some of the morning papers. Edging our way among the crowd on one or two occasions, we saw that the applicants were unmistakably in need; a great many, however, being those who always are upon the fringe of the labour market, and constantly standing on the brink of starvation. On subsequently questioning a number of poor fellows as to whether they had visited the hall and accepted relief, their reply was invariably in the negative. They were afraid that if they had done so it would have reached the ears of their 'mates,' and they would never have heard the last of it.

Thrifless while labour is plentiful, how can such people be assisted? They abhor the parish, though directly or indirectly they pay rates, and they will not have charitable people prying into their homes with bread-tickets. The method of reaching them is a secret. Over and over again have clergymen and others complained to us that they cannot 'get at' the working classes. Certainly not, for they will not let the working classes 'get' into their drawing-rooms to shock them with their vulgarity. Neither do the working classes wish to intrude there. But if any clergyman in his youth has learned some handicraft trade, and can shew them that he can handle a chisel or wheel a truck as well as themselves, he will be received with open arms and more than deference. The working classes hold *laborare est orare* in all its inflexibility, and in their eyes no labour but hand-labour has any value. Your brains may certainly be necessary to guide, arrange, and plan, still they argue that without their handiwork, brains would be at a discount. Hence, when they are in distress, they will not trouble 'brains' to assist them. But from any one who is as competent with the hands as themselves they will gladly receive assistance; and it surely might be possible to arrange on a future emergency that foremen and others who are acquainted with deserving cases should have the means of distrib-

uting a few shillings weekly all round until the bad time be tided over. The money could readily be found, and—treated by the recipients as a loan to be repaid when better times should come—would be carefully expended; the only difficulty would be in finding a suitable method for its distribution.

So long, however, as thriftlessness during good times rules rampant, and money that ought to be laid aside is squandered in dissipation, so long will want and misery prevail when dull times come. If the working-man could be taught that what he makes while the sun is shining *must*, in part, serve for the exigencies of the rainy day, there would be less of periodical starvation in the country.

EPISODES IN THE LIFE OF A BOW-STREET OFFICER.

A WELSH ADVENTURE.

AMONG my other experiences of life, it has been my lot to hold the position of sergeant in the metropolitan police force. I was stationed at Bow Street, and was one of a very small number of officers to whom was delegated the duty of attending at those prisons throughout the country where it was necessary to re-apprehend criminals about to be discharged, but against whom warrants were issued from the Home Office on account of them being 'wanted' to answer for other misdeeds. The task, as may be readily imagined, was sometimes one of no small danger; and a brisk and active life we led at all times, for there was work enough to keep us pretty well always on the move. It was a life of excitement and not without attraction for those who were possessed of an adventurous spirit, such as I fancied I did possess in a very great degree at that period of my life.

One day I had a summons to the presence of the chief magistrate, who put into my hands a warrant that would take me down to the heart of a mining locality somewhere in Wales. I purposely avoid being more definite. From inquiries that I made I learned that the individual whom it would be my duty to bring up to London was a criminal of considerable notoriety, whose presence was most particularly in request, on account of some flagrant misdeeds that the authorities could on no account overlook. I also ascertained that he was a powerful and rather desperate character, and that I need not count on the capture being an easy one. But I knew that in case of need I could arrange with the prison authorities for assistance, and that if I once got the 'darbies' (handcuffs) fairly on I might count the worst of the job over.

It was the spring-time of the year, somewhat raw and gusty, but not by any means bad travelling weather on the whole. Within the hour after receiving my warrant and the needful directions for my route, I was speeding away westwards from Euston; and early in the evening was deposited at a small town a few miles from my destination, the railway going no farther. It was easy for me to procure a conveyance, on my

shewing who and what I was; and I drove over to the county prison, intending to use the vehicle the next day in conveying back myself and capture. The drive was not a very long one; and I arrived in ample time to make all my arrangements with the governor, and to accept of an invitation which he gave me to meet some of the leading tradesmen of the place at the principal inn later on in the evening.

I made a comfortable though somewhat late dinner at the *Wrekin Arms*, and had abundant leisure to smoke a quiet pipe or two before the parlour company began to assemble. My introduction being duly made, I must say that I met with a truly hospitable reception. Vanity apart, I have no doubt that to the tradesmen of the dull place it was no small excitement to find themselves on neighbourly terms with one of the Bow-Street officers, whose fame even now extends all over the country, but who were a good deal more looked up to in the days that I speak of; Dickens having then riveted the attention of the reading public everywhere on the detective and his doings. A pleasant evening was spent, and I had an attentive audience when I told one or two of my best stories; the only thing to complain of—though nobody did complain—was that the sitting was prolonged to rather a late hour, considering the work before me for next morning.

In good time I drove up to the county jail, and leaving my vehicle in charge of a warder who was on the look-out for me, I was quickly in the presence of the governor. We were in the reception-room of the prison; and after a few minutes' talk the order was given for the production of the individual whom I had come to take charge of. Presently he entered the apartment with a lively step and a jaunty air, but which changed in an instant to something very like a look of dismay when he found me with the governor. It was plainly evident that he had guessed my character in a moment, and that he as clearly understood the errand I had come on.

'Here is your discharge Jones, and some things belonging to you,' kindly observed the governor. 'But I am sorry for your sake that I have to tell you this officer is here with a warrant to take you to London; and as go you must, I would earnestly desire you to go quietly, as being best for you in the long-run.'

'I will not give in,' answered Jones sullenly and hoarsely, while there was a twinkle in his eye that foreboded mischief. 'The Bow-Street bobbie,' he continued, 'knows he has no right to grab me inside the prison; let him come outside and try and take me.'

'We know there are a lot of roughs outside, and among them very likely some of your old pals, whom we suspect to be waiting for no good purpose; and therefore,' remarked the governor, 'we think we have a good excuse for stretching the law a bit. Once more I would counsel you

to let the officer put on the bracelets, and spare us the necessity of having to use force.'

Jones's answer was an oath of defiance, which it is not necessary I should write down, and which he had no sooner given utterance to, than, at a nod from the governor, he was in the clutches of two of the warders.

Though a little taken by surprise, the prisoner was not placed at any disadvantage, for he struck out swiftly and strongly. It was a fair up-and-down fight, which admitted of no third party interfering. Now one or other of the warders was down, now the prisoner, but neither party could boast of any decisive advantage. After an ineffectual struggle of some little duration, the two assistants fairly gave in, blown, and quite out of breath.

More defiant than ever, Jones stood as if rather proud of his victory; and I must say the governor looked not a little nonplussed, if not downrightly dismayed. I am a man but little above the middle height, and still tough and wiry; but at the time of which I now speak I had the advantage of being in first-rate training. Jones, as I hinted at the outset, was a big and powerful man, who had gone through many a rough encounter in the course of his criminal career; and it was not, I must confess, without some small misgiving that I made up my mind to encounter him single-handed. To my demand that he should at once submit before more force was called in, he promptly answered by immediately grappling with me.

By birth I am a Devonshire man, and from a part of the county closely bordering on Cornwall. In my younger days I had engaged in many a wrestling-match, and was by no means unacquainted with the Cornish 'hug' and other dodges of those who follow the athletic sport. I soon found that my antagonist was powerful enough, but that he was unskilled. He had much the greater amount of strength; but I had endurance, and could wait my opportunity. After several desperate attempts on his part to get me down, a chance offered, of which I instantly availed myself—a dexterous back-throw, and over he went flat, and with a stunning crash measuring his length on the floor. Before he could recover from the effects of the fall, I was free from his grasp, and he was at our mercy.

In a minute or two he was all right, and holding up his hands, said: 'I give in. You're a somethinged plucky fellow, or you couldn't have done it so neatly.'

The handcuffs were adjusted, and both myself and prisoner bade the governor good-bye; thanks being added on my part for his attentions. When we reached the prison entrance, I did not like the look of things at all. There was a considerable crowd gathered, and among them some very ugly-looking customers, who seemed as if they would not mind a 'scrimmage' in the least. Seeing how things looked, and bent on making sure of my man, I unlocked his right hand, and secured him to my own left wrist. I had not many yards to go to reach my vehicle, and I made a show of meeting the scowling and threatening countenances around me with as easy an air as possible;

and this I found it all the less difficult to do when I discovered in the crowd some of my entertainers of the previous evening, whose presence gave me a certain sense of safety. On reaching the trap, I whisperingly asked the warder in charge of it if he could drive; and being answered in the affirmative, I told him to mount and take the reins. In a moment I had my prisoner in, and off we went at a rattling pace.

When fairly clear of the town, and past all apparent risk of pursuit, I again secured both hands of my involuntary travelling companion, and dismissing the warder, I took the reins myself. Jones sat perfectly quiet, and seemingly quite resigned to his fate. Before, however, we had gone far, he turned abruptly to me and remarked: 'You were in a precious funk when we got outside the prison; and I fancy you had half a mind to call upon the warders to guard you to the trap.'

'No,' I replied; 'I cannot admit that I was in any bodily fear; and besides, there were some of the townsmen in the crowd, who would have come to my help, I have no doubt, had there been occasion.'

'I can tell you, you were in more danger than you mayhap counted on,' rejoined my prisoner. 'There were pals of mine in that crowd who had come for the express purpose of rescue; and had I only but given the word, you would have had a rough time of it before the tussle was over.'

'They would not, however, have got you,' I replied, 'without they had first wrenched off my arm to set you at liberty.'

'Why, they could have got the key and unlocked the darbies—couldn't they?'

'No,' I said. 'I don't think they could have found out where I hid the key; and I'm quite sure they would not have got it if they had guessed where I had it.'

'Why, where on earth *did* you have it?' asked Jones with evident amazement.

'Well,' I answered, 'just to let you into a little bit of a secret, I may mention that I had the key in my mouth all the while; and I would certainly have swallowed it sooner than let any of your chums get possession of it.'

My prisoner was evidently dumfounded, and had but little more to say during the remainder of the drive. In due time we reached the town where we were to take the rail; but long before the time for the train starting, I drove up to the inn where I had hired the vehicle, and asking the landlord for a private room, I ushered Jones into it.

When we were alone and in no danger of being interrupted, I entered freely into conversation with the poor wretch. I frankly pointed out to him that my duty was not by any means an agreeable one even to myself; but that I would be glad to make things as pleasant as possible for him while we had to bear each other's company. 'Trust me as a man, and behave like a man, you shall have a man's treatment. Act like a dog, and you will have to be treated as a dog,' was the conclusion of my brief but very emphatic address.

He seemed pleased, though in a surly sort of way, I must confess, with what I said to him; but still he looked so far softened as to encourage me to add, that if he would pledge me his word to make no attempt at escape, I would relieve him of

the handcuffs while we were not under public observation, and would treat him as a friend until he passed out of my custody. He did not at once respond to my offer; but after a minute or two of thought, he answered in a hearty tone that had a truthful ring about it: 'I'll do it.' Presently, he added: 'You deserve the pledge; and I'll keep it. I like a fellow that shews pluck, and you have shewn plenty of it to-day, both when you laid me on my back—and it's not many could do that—but also when you marched me through among my pals with such a bold front, and they a dozen to one against you.'

Off came the bracelets in a twinkling; and as there was leisure to spare, I ordered a plain but substantial dinner, early as it was, and took care that there should be plenty of good beer, which I knew would be the greatest treat to my charge. After dinner came a pipe or two, which my man enjoyed prodigiously; and I took care there should be ample store of tobacco for the journey, with a modest flask of spirits to cheer the way; for I had no objection to the good things of life myself, and I meant my companion to have all the comfort I could afford while he remained with me.

I had of course to put on the bracelets again when we marched to the station; and as I was known to the guard, a hint from me was sufficient to procure us a compartment all to ourselves by the simple process of locking us in. The conversation of my travelling companion was not without a melancholy interest, for he was a man who had wasted many years, and some small amount of energy and ability, in an unavailing war against society. I remember thinking at the time what a splendid soldier the fellow would have made in a hot campaign, for he had been noted throughout his career for plenty of dash and enterprise, which had latterly degenerated into something like a sullen ferocity.

We reached London punctual to our time. I handcuffed my man, called a cab, and drove off from the station. As we drove along, it came into my head that I would like to give the poor fellow one more taste of freedom however brief. I told the cabman to pull up at a place where I knew we could be private; and on our getting out, I intimated to my charge that I was going to stretch matters a little in his favour by treating him to another drop of beer and a pipe. Relieving him of the bracelets, I set a tankard before him and handed him my tobacco-pouch. He seemed sensible of the attention paid to him, but looked somewhat bewildered, and was very quiet. When the beer was finished, and the pipe smoked out, he put out his hand, took mine, and burst into tears. 'I've been treated like a wild beast for years,' he exclaimed with bitterness; 'but you are a man, and have shewn the kindness of a brother. I will never forget you!' The fierce outcast of society was subdued. Without the preceding display of force, there would probably have been no ground to work upon; but I think I may venture to say that the succeeding show of confidence and kindness was called for to make the subjection complete.

He held out both hands of his own accord for me to put on the handcuffs, and we drove off to Bow Street. I may just add that I never saw Jones again. He got some very lengthened

term of penal servitude, towards the end of which, as I learned quite accidentally, he died of heart disease.

A GOSSIP ABOUT FEES.

VERY pleasant to a young lawyer is his first fee, the forerunner, in his mind's eye, of many a retainer and refresher in store for him as he works his passage from the bar to the bench. But it is oftentimes weary waiting for that first modest reward, mortgaged, maybe, long before it comes; like the future celebrated Counsellor Scott's half-guinea, which had to be handed over to his Bessy, in accordance with the agreement between them, that he was to take the receipts of the first eleven months of his barristerhood, and give her all he earned in the twelfth month for her own use.

Parsimonious as he is reputed to have been, that was not the only instance of the future Chancellor Eldon cheerfully surrendering the fruits of his labour. While he was still only a rising man at the bar, not overburdened with riches, his hairdresser remarked to him, that if everybody had their own, a certain friend of his, then in indifferent circumstances, would be enjoying the possession of a fine estate. Scott sent the hairdresser to Solicitor Bleasdale to have the facts reduced to writing, and then set about the necessary proceedings to recover the property for its rightful owner; asking the solicitor to keep an account of the fees to which he would be entitled, until the termination of the suit. When it did terminate in the triumph of Scott's client, Mr Bleasdale presented him with a purse containing the whole of the fees due, in gold. Sending for the hairdresser, he congratulated him upon his friend's success, and tossing the well-lined purse to the astonished man, said: 'You have had a good deal of trouble in the affair, so take that purse.'

Another Scott, more famed as a poet than a pleader, had a housebreaker for his first client at Jedburgh, and did his best for the rogue, who in thanking him after the trial, expressed himself as much grieved at being unable to repay him in current coin; but lacking that, gave him two valuable bits of information; assuring him that a yelping terrier inside a house was a better protection against thieves than a big dog outside a house; and that no sort of lock so bothered one of his craft as an old rusty one. Philosophically accepting the inevitable, the author of *Waverley* consoled himself by turning the couplet:

Yelping terrier, rusty key,
Was Walter Scott's first Jeddart fee.

Yet more unsatisfactory was the product of M. Rouher's first brief, held in behalf of a peasant. When the verdict had been given in his favour, that worthy asked his eloquent advocate how much he owed him. 'Oh, say two francs,' was the answer. 'Two francs!' exclaimed the ingrate; 'that's very dear. Won't you let me off with a franc and a half?' 'No; two francs or nothing,' was the counsel's ultimatum. 'Well then,' said his client, 'I would rather pay nothing;' and with a bow, he left M. Rouher to reflect upon rustic simplicity.

To be taken at one's word is not always agreeable, as Daniel Webster found when outwitted by the Quaker. The Clockmaker is responsible for the story, and we must let him tell it. 'This Quaker, a pretty knowin' old shaver, had a cause down to Rhode Island; so he went to Daniel to hire him to go down and plead his case for him; so says he: "Lawyer Webster, what's your fee?" "Why," says Daniel, "let me see. I have to go down south to Washington, to plead the great insurance case of the Hartford Company; and I've got to be at Cincinnati to attend the Convention; and I don't see how I can go to Rhode Island without great loss and fatigue. It would cost you, maybe, more than you'd be willing to give." Pressed to name what he would take, Webster said a thousand dollars. The Quaker well-nigh fainted when he heard this. But he was pretty deep too; so says he: "Lawyer, that's a great deal of money; but I have more causes there. If I give you the thousand dollars, will you plead the other cases I shall have to give you?" "Yes," says Daniel; "I will, to the best of my humble abilities." So down they went to Rhode Island; and Daniel carried the case for the Quaker. Well, the Quaker he goes round to all the folks that had suits in court, and says he: "What will you give me if I get the great Daniel to plead for you? It cost me a thousand dollars for a fee; but now he and I are pretty thick, and as he is on the spot, I'd get him to plead cheap for you." So he got three hundred dollars from one, and two from another, and so on, until he got eleven hundred dollars; jist one hundred more than he gave. Daniel was in a great rage when he heard this. "What!" said he, "do you think I would agree to your letting me out like a horse to hire?" "Friend Daniel," said the Quaker, "didst thou not undertake to plead all such cases as I should have to give thee? If thou wilt not stand to thy agreement, neither will I stand to mine." Daniel laughed out ready to split his sides at this. "Well," says he, "I guess I might as well stand still for you to put the bridle on this time, for you have fairly pinned me up in a corner of the fence anyhow." So he went good-humouredly to work and pleaded them all.'

Lawyer Dudley, a fellow-countryman of Webster's, was not to be so easily beguiled into giving advocacy gratis. Having to defend a man accused of helping himself to a hog belonging to a neighbour, he succeeded in obtaining an acquittal. 'How can I ever repay you, Mr Dudley?' said the lucky rascal. 'I haven't a cent; accept my thanks.' 'Thanks?' cried the lawyer. 'Send me a side of the pork!'

This reminds us of Abraham Lincoln's story of the hog-stealer who insured his safety by judiciously placing his ill-gotten provender. The theft and the identity of the thief were so incontestably proved, that Mr Lincoln did not see his way to fighting against a conviction, and intimated as much to his client. 'Never mind about that,' said he; 'just abuse them witnesses like the deuce, and spread yourself on general principles.' Mr Lincoln obeyed instructions. The jury retired, and after a short consultation, astonished everybody but the prisoner by declaring him not guilty. 'You see, squire,' he explained, 'every one of the fellows had a piece of them hogs!'

Let things go well or ill with the world in

general, there is never any lack of work for gentlemen learned in the law. Every parliamentary session sees the creation of new offences, the invention of fresh openings for litigation; a game increasing every day in costliness, thanks to the liberal use by solicitors of their clients' money, till one is inclined to echo Uriah Heep's saying, 'lawyers, sharks, and leeches are not easily satisfied.' In taxing the costs in a cause tried at Carlisle, the Master only allowed a counsel's fee of thirty guineas on the brief, with fifteen-guinea refreshers from the second day of hearing. Against this decision the parties concerned appealed, stating that they had paid a Queen's Counsel a retainer of a hundred guineas, and given him a daily refresher of twenty-five guineas, commencing with the first day of the trial. This astonished the court; and one of the judges remarked that he had never before heard of a counsel receiving a refresher for the first day, and could not imagine what he could want with one; whereupon a learned brother suggested that he possibly required it to refresh himself after his long journey. But the court declined to sanction the innovation, or to interfere with the Master's award.

The relative positions of solicitor and counsel would appear to be reversed in France, if a story told lately by the Paris correspondent of a London newspaper be really true. 'We have long had the fable of the lawyer eating the oyster and giving a shell to each pleader, and now we have a pendant. A French lawyer in a separation case pleaded very warmly for his client, who, he said, was literally dying of hunger, and who had two little children. He demanded the immediate aid of two thousand francs, in the name of humanity and in the name of justice, and full of confidence threw himself on the equity of the court. A few days later his client received the following letter: "Madame, I am happy to say we have succeeded in obtaining the provision of two thousand francs. I have handed a thousand francs to your attorney, who has given me a receipt, and I am much obliged to you for the surplus in settlement of fees."'

In a case tried at Dunfermline in 1876, two Edinburgh doctors deposed that there was no fixed scale of fees for consulting-physicians, but that the ordinary charge was from two to three guineas per hour; and three local doctors testified that they usually paid a consulting-physician fifteen guineas a visit. From a medical journal we learn that London physicians and surgeons of ordinary repute charge a guinea a visit, two guineas for consultation with another practitioner, one guinea a mile for journeys by road, and two-thirds of a guinea per mile for journeys by rail. Fees for performing operations, or assisting at them, are left very much to the judgment of the individual; but there is a sort of loose understanding that for the great operations involving a risk of life a hundred guineas is a proper average fee; half that amount sufficing in minor cases. Ophthalmic surgeons have made a hundred guineas the current charge for extracting a cataract; fifty guineas that for iridectomy; twenty-five guineas that for strabismus; and so on, with more or less variation, according to the standing of the surgeon and the means of the patient. The principle, however, of charging for a thing not according to its value, but by the presumed depth of the purchaser's purse, is open to question; every

man, be he rich or poor, has an equal right to get his money's worth for his money; whether he has much or little is beside the question. That one practitioner, however, should exact a higher fee than another, is proper enough; we must expect to pay for experience, whether it be our own or that of other people.

A young Parisian lady after being relieved of a tormenting tooth, laid down ten francs in payment. Looking at the fee contemptuously, the dentist asked if that was for his servant. 'No, sir,' responded Madame with a sweet smile; 'it is for both of you.'

A worthy baronet handed his medical adviser his fee rolled up in paper, to find, after the doctor's departure, the proper fee still in his pocket, and a couple of mint lozenges gone. Meeting the defrauded doctor a few hours afterwards, he asked him how he liked his fee. 'Oh, it was very sweet,' was the reply. The next morning saw amends made by the sending of a sovereign and a shilling, with the lines:

The fee was sweet—I thank you for the hint.

These are as sweet; they've both been through the Mint.

The famous Dr Fothergill was once, by his own election, very strangely recompensed for his professional services. A merchant-vessel arriving in the London Docks with captain and crew down with yellow-fever, Dr Fothergill removed the captain to his own house, and succeeded in pulling him through. At first, Fothergill refused to accept any payment at all; but the grateful seaman persisting in rewarding him, he said there was one thing he could do for him—if he were making a voyage to the East and passed through the Straits of Macassar, he should be glad if he would bring him two barrels of the earth of Borneo. This the captain readily promised to do. However, when he reached the spot on his voyage out, his heart failed him; and fearing to incur the ridicule of his men, he sailed through the Straits without fulfilling his promise. Returning by the same route, the same thing happened; but after he had left the Straits two hundred miles behind him, his conscience smote him for his ingratitude, and putting the ship's head about, he made for Borneo, and took in the earth. When Fothergill received it, he had a piece of ground prepared by the burning of the surface, and laid the Borneo earth upon it; and in due time had the satisfaction of making the acquaintance of a number of curious plants new to him.

We hear a good deal nowadays of 'payment by results,' a method of remuneration seemingly not unknown in Savagedom. The Utes, says an American authority, have a peculiar and exemplary mode of disposing of medicine-men unlucky in their dealings with disease. Such a practitioner lately contrived to kill two men and one woman. That, the chief of the tribe, quietly took down his Winchester rifle and made the doctor's three wives widows; believing that a maladroit medicine-man was better fitted for the happy hunting-grounds than for this mundane sphere.

The Fee family is a large one; but we have occupied too much space with the legal and medical branches to have any left for the rest; still we cannot refrain from quoting from an old song glorifying the only fee that is pleasant

alike to giver and taker, and that leaves the giver no poorer:

'Let's kiss,' says Jane.

'Content,' says Nan;

And so says every she.

'How many?' says Batt.

'Why, three,' says Matt,

'For that's a maiden's fee.'

✓ THE MONTH. SCIENCE AND ARTS.

THE audiometer invented by Professor Hughes has been employed, with interesting results, by Dr B. W. Richardson, F.R.S., in testing the hearing of a number of persons. A telephone, microphone, a small battery, coils, and a clock are required in the construction of the instrument. Extending from one of the fixed coils to the other is a graduated bar, from two hundred degrees down to zero, on which the induction coil in the form of a ring may be readily shifted. Place the coil at two hundred degrees and the listener hears the clock ticking surprisingly loud; but from degree to degree as the coil is shifted downwards the sounds decrease, and end at last in absolute silence. The point of silence varies: some persons can hear down to two and a half degrees; others stop at thirty, twenty, or ten degrees, as the case may be, according to their state of health or the sensitiveness of their hearing. Complete silence is necessary during the experiments; and the person under examination should be placed so as not to see the movements of the coil on the graduated scale. It is found in practice that the faintest sounds can be heard only when the decrease is gradual and continuous; and that they are lost by jumps and pauses in the shifting of the coil.

As a rule, the right ear is better than the left; but instances to the contrary have been met with among persons accustomed to exercise their left ear. Some deaf persons fail to remember sounds. A youth was tested who was unable to 'catch all the sounds lying between one hundred and thirty and one hundred and seven degrees until he could remember what he had to listen for;' but by practice he succeeded in identifying all the intervening sounds. These facts, says Dr Richardson, 'seem to indicate that deafness from imperfection of the tympanum or other parts of the organ of hearing may be increased beyond the mere physical failure, either from some lost power of automatic adjustment in the auditory apparatus, or from failure of receptive power in the cerebrum itself, so that the memory rendered imperfect is slow to assist the listener until by exercise of function the readiness is restored.'

The hearing is improved by holding the breath after a deep inspiration; and also by a high barometer. The influence of atmospheric pressure can thus be tested. In his own case, when the barometer is at thirty degrees, Dr Richardson can hear on both sides close down to zero; but below thirty degrees he fails to reach zero on the left side by two degrees. He is of opinion that the audio-

meter will be 'an essential in all physical examinations of men who are undergoing examination as to their fitness for special services requiring perfect hearing, such as soldiers, sentries, railway officials, and the like.' Also in diagnosis; in differentiating between deafness through the external ear and deafness from closure of the Eustachian tube—throat deafness; and in determining the value of artificial tympanums in instances of deafness due to imperfection or destruction of the natural tympanum. In actual practice Dr Richardson finds the best artificial ear-drum to be a small gold cylinder, with which he restored fifty degrees of hearing to one of his patients, who without it could not hear lower on the scale than one hundred and ten degrees.

By attaching a microphone to a sphygmograph, and connecting with an electric battery and a telephone, Dr Richardson has discovered a method for making the movements of the pulse audible. The instrument or sphygmophone, when prepared, is placed on the pulse in the ordinary way, and as soon as it works properly, a distinct series of sounds is heard in the telephone keeping time with the beats of the artery. 'When all is neatly adjusted,' says the Doctor, 'the sounds heard are three in number—one long sound and two short, corresponding to the systolic push, the arterial recoil, and the valvular check. The sounds are singular, as resembling the two words, *Bother it*,' and in a quiet room may be heard at some distance. Here then is a new appliance for the medical profession, for although not so good a recorder of the pulse as the sphygmograph, 'it may be made,' as Dr Richardson remarks, 'very useful in class, for illustrating to a large number of students at one time the movements of the natural pulse and the variations which occur in disease.' It may become very useful also in studying the effect of stimulants on the circulation. Let the person under examination drink whisky and in three minutes the pulse gallops, and sounds are heard at times which may be described as screams.

A German professor has arranged a flexible stethoscope in such a way that, as is reported, he can hear the rush of the blood through the capillaries of the skin; also the sounds of muscular contraction, tendinous extension, and the vibration of the long bones. The name of this sensitive instrument is dermatophone.

The Institution of Mechanical Engineers have published a long list of 'subjects' on which they desire to receive papers for reading and discussion at their meetings. Machinery of all kinds, manufacturing operations, and mechanical devices are included. In some instances the refinements of science are required, as in lighting by electricity, and in improvements in the construction and insulation of electric telegraphs, in the transmission of messages, and in telegraphic writing. The Council of the Institution intend to propose that during the present year three hundred pounds shall be expended in promoting 'experimental research on unsettled mechanical questions,' which can hardly fail of acceptance. Three questions have been chosen for a beginning: 'the conditions of the hardening, annealing, and tempering of steel; the corrosion of different classes of steel and iron; and the best form and proportions of riveted joints, both for iron and steel plates.'

It has been ascertained by experience that a rail of Bessemer steel will last nine times as long as an iron rail. About one-third of the railway mileage in this country is laid with Bessemer steel rails, and the economy thereby effected is well pointed out by Mr Price Williams, who states: 'It is estimated that the annual saving in labour alone, in the ordinary maintenance of the lines, which has resulted from the less frequent breaking up of the permanent way where steel rails are now used, is equivalent to the saving of the services of at least a man in every three miles; and this at seventeen pounds per mile will, on ten thousand one hundred and ninety-four miles of single line already laid with steel rails, these being the most heavily worked sections, represent an annual saving of one hundred and seventy-three thousand two hundred and ninety-eight pounds:' to which must be added the much larger sum saved by not having to renew the rails so frequently as in former years.

In a discussion at a meeting of the Institution on Economy in Railway Working, Captain Douglas Galton pointed out that the traffic best deserving of attention by railway companies is third-class traffic. The first class is stationary; the second class declines; but the third class is always growing, and the receipts therefrom could be 'very largely' increased by a further reduction of fares. This was corroborated by Mr Price Williams, who stated that while the profit on first and second class traffic amounted to not more than twenty per cent. the third-class profit might be 'roundly put at seventy-five per cent.' And further: 'Taking the whole of the third-class passengers of the kingdom, the average fare per person was one shilling, and detailed statistics conclusively shewed that ninepence out of that shilling was clear profit to the railway companies. That being so, it would be well for railway managers to consider whether Captain Galton's suggestion of a still further reduction in third-class fares could not be adopted with advantage.'

Professor Osborne Reynolds, President of the Scientific and Mechanical Society of Manchester, in his address to that Society, instanced the past year as one of mechanical improvements and mechanical disasters; the latter, collisions and sinking of ships, and collisions and so-called accidents on railways. He shewed that our achievements in speed have gone far beyond our means of stopping and turning, and that the important problem now is to stop and turn with a readiness and completeness proportionate to our locomotive speed whether on land or water.

The problem as regards stopping a railway train seemed easy of solution: it was known that a single carriage could be suddenly stopped by screwing the brake blocks tight, and so skidding the wheels. But Captain Galton's experiments have proved that it is not the same with a number of carriages, for he discovered that 'by skidding the wheels the brake loses nearly half its greatest power of stopping a train. If the brake is applied with the greatest force short of skidding the wheels, the train will stop in something like half the distance required if the wheels are skidded.'

Professor Reynolds's conclusions on the question of speedy turning of ships so as to avoid a collision were stated in a recent *Month*: it is as much an error to expect the rudder to act on reversal

of the screw of a steamer, as it is to stop a train by skidding the wheels. 'The whole error,' we are told, 'arises from a failure to grasp the circumstances on which the action of the rudder depends. As long, and only as long as the water is rushing backwards past the rudder, will the rudder exert its normal tendency to guide the ship.' The problem in this case is far from being solved.

Niagara is confessedly a 'water-privilege' of the foremost rank for power and grandeur. If that prodigious power could only be transmitted to a distance, what a number of places which are now idle for want of power, might avail themselves of the electric light, and take to spinning and weaving, hammering, sawing, planing, grinding, and other mechanical employments! Surprising statements on the question have been put forth: one, that the cost of an efficient cable would be sixty dollars a foot; another, that the copper deposits of the Lake Superior region, ample as they are, would not suffice for the construction of a cable to transmit the power of the mighty waterfall. In answer to these statements, Professors Thomson and Houston of Philadelphia, whose electro-magnetic researches we have before noticed, tell us that should it be deemed desirable, the total power of Niagara might be conveyed a distance of five hundred miles or more by a copper cable not exceeding one-half of an inch in thickness. For the consumption of one million horse-power, they say that a cable of three inches diameter, if perfectly insulated, would suffice. Of course no single locality could make use of such a vast amount of power; but 'the important fact still remains, that with a cable of very limited size, an enormous quantity of power may be transferred to considerable distances.'

Similar views were expressed by Sir William Thomson in the evidence which he gave a few weeks since before the Select Committee on the Electric Light. 'There would be,' he said, 'no limit to the application of electricity as a motive-power; it might do all the work that could be done by steam-engines of the most powerful description.' And he thought that 'legislation, in the interests of the nation and in the interests of mankind, should remove as far as possible all obstacles, such as those arising from vested interests, and should encourage inventors to the utmost.'

Experiments have been made by the Trinity House on the lighting of buoys with gas, which is manufactured from waste fatty matters or the refuse of oil-works. This gas is passed into the buoys under severe pressure, until a sufficient charge is accumulated to burn for three or four weeks, shewing a bright light by night and day, even in boisterous weather. Here then is a means of lighting an intricate channel, or a passage, or of indicating the position of a wreck, which cannot fail to be useful; and the Trinity Board have ordered the construction of two buoys which will hold compressed gas enough to burn from four to six months. With these, further and, as we may assume, conclusive experiments will be carried on in the estuary of the Thames. The same kind of gas is, we are informed, used for the lighting of railway trains.

The difficulty of raising sunken ships from deep water has led to the invention of the 'gripping camel,' which, when floating over the wreck, lets

down two long arms to which air-bags are attached. The arms are intended to grip the wreck; but the grip is a flexible grip, for air is forced into the bags, which press with increasing force against the sides of the ship, and impart an element of buoyancy. At the same time the lifting power of the floating camel is augmented, and thus the sunken vessel will be lifted. Should it have sunk into a deep bed, a special contrivance sends down a strong jet of water, which, properly directed, soon washes away the heavy pressing sand.

Another method has been made known and discussed at a meeting of the United Service Institution. An iron tower is placed upright by the side of the sunken ship: from the inside of this tower, holes can be bored, into which attachments are fastened. The boring is carried on by means of compressed air, and a man in the tower guides the tool. There may be two or more towers according to the weight to be lifted. When all the attachments are properly made, a floating dock is placed directly above the vessel to be raised; and by alternate pumping out and taking in of water, and taking advantage of the tides, the lifting is accomplished, the dock steams shorewards; the wreck grounds, and is again lifted, until, after a series of repetitions, she is safely placed in the floating dock and carried into port.

That the different colours of the spectrum have an influence on vegetation, has long been known. Plants grown under green glass soon die; under red glass they live a long time, but become pale and slender. Mr Yung of the University of Geneva has placed the eggs of frogs and fishes in similar conditions, and found that violet light quickens their development; and blue, yellow, and white also, but in a lesser degree. Tadpoles on the contrary die sooner in coloured light than in white light. As regards frogs, Mr Yung has ascertained that their development is not stopped by darkness, as some observers have supposed, but that the process is much slower than in the light.

In an account of a simple and sure method of detecting the difference between natural and artificial turquoise, the *Journal* of the Chemical Society states that artificial turquoise is manufactured in at least three countries of Europe. And further, that these imitations possess all the characteristic physical properties of the natural stone in regard to colour, hardness, density, fracture, and appearance under the microscope; even the brown ferruginous inclosures characteristic of some inferior oriental turquoises being added, while a qualitative analysis simply shews the composition of the imitation to be almost identical with that of the true turquoise.

An extra volume of Philosophical Transactions has been published by the Royal Society, containing 'An Account of the Petrological, Botanical, and Zoological Collections made in Kerguelen's Land and Rodriguez during the Transit of Venus Expeditions, carried out by Order of Her Majesty's Government in the years 1874-75.' The two islands thus visited are so peculiar and so little known, that the particulars given by the painstaking naturalists of the results of their adventurous endeavours will be found unusually interesting to general as well as to scientific readers.

A French inventor residing at Sermaize les Bains (Marne), who has been engaged in perfecting his apparatus for applying electricity to agri-

cultural work, has had a public trial of his electric plough. The electricity which propels the plough is not produced by voltaic batteries, but by a powerful gramme-machine which works under shelter, while copper wires, resembling those of the ordinary telegraph, connect it with the plough. The gramme-machine for generating the electricity, though usually worked by a small steam-engine, may be driven, when convenient, by wind or water power. The process—any questions concerning which may be addressed to M. Peronne, Sermaize les Bains, Marne—has been patented, and a Company formed.

A PROVIDENTIAL ESCAPE.

It was in the summer of 1855 that a party of some thirty children, ranging in age from five to ten years, were returning for dinner from the 'District School,' some few miles west of Cincinnati, Ohio, United States, when one of those sudden thunder-storms, so frequent during the hot season in that part of the world, burst on them. The school-house was situated in the midst of a piece of waste land known as 'The School Common,' and before the children had cleared the Common they were nearly wet through, and the terrific lightning and reverberating thunder were quite enough to appal older and stouter hearts; and they had still another quarter of a mile ere they could reach the village.

Although the Common itself could boast of neither tree nor shrub, yet just at its edge stood one of those gigantic oaks which the settler's axe had spared. Beneath its branches the whole party could easily find shelter, and although the storm had been raging some five minutes, its foliage was so dense that the ground underneath it was quite dry. 'Let us get under the oak,' said one little panting mortal. 'Ay, ay!' was echoed and re-echoed by several; whilst all as quickly as possible put the resolution into practice. Just then, one little girl suddenly said: 'We ought not to stay here. I've heard of lightning striking trees and killing any one who happened to be under.' And at last she persuaded them to face the storm once more; nor did they stop again till they had reached the village, where they took refuge.

The storm, furious in its character, soon spent itself; and an hour and a half after, several of the same little people, well fed, and attired in dry clothing, were again making their way to the school, when suddenly, with blanched cheeks, they saw the old oak which had withstood the storms of centuries, still standing certainly, but with several of its branches torn off, others broken and hanging loose, and its huge trunk scorched as though a fire had been kindled all around it. The tree had been struck by lightning. The news of the narrow escape was soon known; and feelings of admiration for the presence of mind displayed by the little girl were mingled with thankfulness for the narrow escape which she and her companions had made.

Perhaps the story may teach those who are unaware of the danger, to avoid the shelter of solitary trees during a thunder-storm. Nothing can be more hazardous, a fact which the death-rates by lightning thus attracted, shew.

KNITTING.

Knitting gaily in the sunshine,
While the fragrant roses blow,
And the light wind stirs the petals,
Till they fall like flakes of snow;
Laughing gladly, glancing shyly,
At the lover by her side—
Saucy dimples, coy confessions,
All a maiden's love and pride;
Weaving in with skilful fingers
Girlish fancies, pure desires,
While the brightness of the future
Flashes through the twinkling wires;
And a young heart's fond ambitions,
Tender hopes, and golden dreams,
Deepen as the sunlight deepens,
With its thousand darts and gleams.

Knitting silent in the shadows,
With a drooping, weary head,
Gazing out into the twilight,
Whence the life and light have fled;
Moving nerveless, languid fingers;
Striving to be bright in vain,
And to still the heart's wild flutter,
Throbbing in its mighty pain;
Working through the silky texture,
All a woman's anguished fears,
Looking out on past and future,
Through a mist of burning tears.
Knitting patient in the twilight,
Quietly bearing all her woe,
While the roses shed their petals
In a fragrant summer-snow!

Knitting fiercely, in the anguish
Of a burning, fiery strife;
Or quietly in the sunlight
Of a calm heart's happy life.
Knitting heavily and slowly,
In life's last fitful hours;
Or skilfully and gaily,
Among the summer flowers!
Weaving in a glorious future;
Or a soul's dumb aching pain.
With the memory of pleasures
That will never come again!

Thus a woman's life is bounded
By the humble, daily task,
Meekly taking up her burden,
Pausing not to strive or ask.
Ah! how many hearts beside us,
Were we not so worldly wise,
Might we see in gentle moments,
Looking out from wistful eyes!
And how often, did we listen,
'Neath a gay and laughing tone,
Could we hear the bitter yearning
Of a strong heart's restless moan!

BEE.

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'
- 2d. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.
- 3d. MANUSCRIPTS should bear the author's full *Christian* name, surname, and address, legibly written.
- 4th. MS. should be written on one side of the leaf only.
- 5th. Poetical offerings should be accompanied by an envelope, stamped and directed.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

FASHIONABLE VAGARIES.

THERE is one thing which we have never been able to understand, and which we believe few can possibly comprehend or explain. It is the vagary of female fashion. Who it is that invents it, and has the knack to maintain it as long as he pleases, and then with equal audacity and success starts something fresh, is all a mystery. The phenomenon is by no means new. A hundred and sixty years ago, the old essayists were at a loss to know how the extravagant oddities of female attire originated, and were so cleverly kept up in spite of torrents of ridicule. Then, as now, a new fashion had its run of a few years, and dropping out of use as mysteriously as it commenced, was followed by something equally preposterous. High-heeled shoes, lofty head-dresses, hair-powder, long and short waists, painting and patching, all had their day. For a time the wearing of hoops, by which a lady could enter a door only sidewise, was a favourite frenzy. The fashion of taking snuff, usually from a pretty circular box with a picture on the lid, was just going out of practice among ladies in our early days. The last lady whom we saw taking a pinch and handing round her box was—

She, the fair sun of all her sex—

Burns's Clarinda! Such a circumstance seems now very absurd; but it was only of a piece with a long catalogue of fashionable vagaries, in which no rational meaning can be discovered.

The world is said to be getting wiser every day. Certainly, there is an abundance of teaching, reading, and lecturing, from which presumably there should be an increase of intelligence. In almost nothing has there been such a signal advance within the last hundred years as in female education. Yet, with all the visible elements of diffused knowledge and thoughtfulness, no one can observe the slightest abatement in the frolics of feminine fashion. Ladies aspire to be social reformers, to be voters at elections, to be members of school-boards, actually to be

doctors; and some think they do not acquit themselves badly. The strange thing is, that, with rare exceptions, the wisest and most accomplished ladies are quite as much the voluntary thralls of Fashion in its more contemptible forms as the less instructed in the sisterhood. There they are like the rest, wearing the grotesquely shaped dresses which remind us of the drolleries of a pantomime.

In these vagaries of Fashion there seems for the time-being to be a kind of mental derangement—perhaps more correctly the prostration of intellect, through a deficiency of moral courage. Forty years ago, the lady part of mankind fell into a mania for wearing dresses with huge shoulders blown up like balloons. It amounted to a purposeless distortion of the person. So everybody said it was. But the avowal made no difference. Sleeves must be made six times larger than they need be. Shoulders must be distorted, rendered positively ugly. It was the Fashion, and that was enough. In due time, when the mania had run its course, the ballooning was given up, and shoulders shrunk to their natural figure. When it was all over, no one ventured to explain how the frenzy had originated, or what was its meaning. On the contrary, as if ashamed of the weakness, the subject was skilfully dropped. Next in the order of this species of feminine dementia, came the crinoline vagary. A petticoat of horse-hair and whalebone was employed to distend the outer dress far beyond the person. It was a resumption of hoops, with the difference, that while hoops expanded sidewise, the crinoline spread out all round. Every woman had the shape of a hand bell, wide at the lower edge, and small above. Gracefulness was out of the question. If the object was to produce a monstrosity, it was eminently successful. Avowedly, the Fashion had some practical inconveniences. The space taken up by a lady in a public meeting or on the pavement was greatly beyond her proper share. The wide contour was apt to sweep the ground, and send clouds of dust upwards, much to personal discomfort. The quantity of material required for a dress

was so largely augmented as to suggest the idea that silk-mercers had something to do with the invention. Whatever were the drawbacks, the crinoline mania had a fair run of several years. When given up, there occurred the fresh surprise how it ever had received the slightest encouragement.

Crinolines of every variety having been relinquished, feminine society is sorely in want of a new eccentricity. It would be against all rule not to appear ridiculous. So wits are at work in the grand arcana of Fashion. The world had not long to wait. The fiat goes forth from somewhere that, as a superlative novelty, dresses are to be worn tight to the person from top to toe. Instead of paddings and ballooning, there is to be squeezing so tightly as to be hardly able to breathe. To impede walking, and if possible to prevent sitting, the legs are to be held back with strings. By way of compensation for the tightening up, the dress is to be so long as to trail three or four feet on the ground. Such may be called the present fashionable régime, maintained as usual with the force of inexorable law. Woe-be to the fine lady who does not make herself as lank as a skinned rabbit, and who fails in the tuckings and tyings to restrain locomotion! What her natural shape may be is nothing to the point. She may not be able to go up or down stairs, except by one foot at a time, like a child learning to walk, but that is of no consequence. Fashion demands that she shall appear maimed in the lower limbs. The law is to be obeyed, and there's an end of it. Objections, however, are not even hinted at. The chief anxiety is rather to go to extremes. In the furor for being as slim as it is possible to be, the ultra-fashionable young lady gives up wearing the usual under-garments. She clothes herself in tight-fitting vest and pantaloons of chamois leather, over which is a slight exterior dress with trailing skirts. To be in leather is the height of Fashion. 'How do you like your leathers?' asks Lady Betty confidentially. 'Charmed with them beyond measure; could not do without them.' The proverbial expression, 'Nothing like leather,' has obtained new significance.

The unchallengeable authority that by self-election regulates female costume, is doubtless European in character. It may issue its decrees from no very exalted sphere, but it at least possesses the power of gauging the feminine tastes and habits that prevail on the eastern side of the Atlantic. Were it analysed, it might turn out to be nothing more than a shrewd man-milliner, who with an eye to profit in ringing the changes, graciously issues his edicts from a back-shop in Paris. Our smart friends, the Americans, once took it into their heads to set up a rival despotism. The effort was audacious and seemingly well meant. It consisted in substituting light trousers with a kind of kilt for the wonted gown and petticoats. Bloomerism, as this new form of female

attire was designated, never took. It did not proceed on the old lines. It amounted to a revolution, and got so unceremoniously laughed at, that it failed to gain a footing. Yet, there was some good in Bloomerism. It might have answered for female doctors and lecturers, with other varieties of strong-minded ladies who are determined, at all hazards, to assert the rights of women.

Under the sanction of what is deemed to be Fashion, there has sometimes been a cruel waste of innocent and helpless animals. On a former occasion we spoke of the odious practice of slaughtering larks, robins, finches, and other small birds, in order to embellish ladies' head-dresses. The vile practice continues, with some additional and costly eccentricities. In one of the monthly records of Fashion we see it stated that, 'After having admitted lizards as side bouquet fasteners, and mice as hat-trimmings, we have now instances of ladies wearing dresses made entirely of scarabæus, birds, insects, and other animals. I have not seen the dress, but a friend of mine tells me that the other evening she saw a lady dressed as an owl! The foundation of the dress was of dark blue, and was trimmed with owls' feathers. In front the apron was entirely of these feathers, and instead of a bouquet in front of the bodice, there was an owl's head, with a similar head in the hair.' The same authority informs us that the right thing is a toque or evening head-dress, 'trimmed with birds' wings, or silver mice, birds, or lizards.' We are not told whether these are real animals or only effigies in the precious metals. A report has reached us, however, that a lady of fashion in London wears an ornament consisting of a live scarabæus, or Egyptian beetle, which is tethered to the front of her dress to prevent its elopement. It has apparently come to this, that in the vagaries of Fashion the animal world is freely laid under contribution, with a view to secure something piquant— a lizard, a mouse, the head of an owl, or a beetle. What are we to think of the intellect that seriously occupies itself with these frivolities?

Slim in figure, squeezed like a wasp, and with head-dresses as fantastic as can be devised, there is one more token of high Fashion. It is a return to the antiquated practice of wearing high-heeled shoes, which happily falls in with the plan of bandaging back the legs, to prevent freedom in walking. The folly of distorting the foot, by throwing the pressure unduly on the toes, is so manifestly vicious, and has been so frequently the subject of remonstrance, that it calls only for a passing denunciation. Those who are guilty of the error will in this as in some other matters live to regret their weakness. The wonder is how the ridiculous extravagances in attire which are here barely alluded to, should for a moment have met with any degree of support. In the article of dress, men and women appear to have pursued an entirely different course for the last

fifty years. The tendency in male attire has been towards extreme simplicity—perhaps too extremely so—while as regards the female mode of dressing, according to Fashion, it has been a succession of wild eccentricities, always going from bad to worse.

Obviously, the mania, now as formerly, is demonstrated in its more outrageous forms by the idle, the thoughtless, and those to whom money is a matter of little consideration, whether as a result of wealth or otherwise. As partially tending to solve a perplexing social question, it might not be uninteresting to ascertain if the numerous bankruptcies of late years were any way due to the vulgar extravagance in dress of wives and daughters contrary to every rule of taste or propriety. Admitting that the articles are honestly acquired, in extravagance of this sort a bad example is set. Crowds of young women dependent on their personal industry, are constitutionally unable to withstand the mania for imitation, and being piteously dragged at the tail of every prevalent Fashion, they throw away means that ought in some degree to have been consecrated to a thrifty regard for the future. Even those ladies who but to a limited extent yield allegiance to fashionable vagaries have something to answer for. In no shape protesting against absurdities which apparently they know to be wrong they practically countenance the current folly; whereas a spirited policy in resisting what is manifestly ridiculous as well as wasteful, would, we feel assured, be appreciated by the male part of the community.

For some such policy, an argument could be found in improving the health of the young. By all who treat on the subject, exercise of the limbs is recommended as a matter of first importance. Girls do not require the boisterous recreations of boys, but due and recreative exercise is nevertheless desirable, with a view to strengthening the frame, expanding the chest, giving an appetite for food, and throwing the bloom of health into the cheeks. How base therefore are the present idiotic fashions of artificially trussing up the person to prevent freedom of movement! Has any one gravely inquired what is to be the destiny of the beings who are so enfeebled? Certainly it is not to be wives! Wherever fathers and mothers can exert their proper influence, this heinous offence against the laws of health should be peremptorily checked. Let girls, of whatever grade, freely exercise their legs and arms at all suitable opportunities. Let them run at lawn-tennis, play at battledoor and shuttlecock if they have a fancy, and take walks and skate in winter. Above all, they should learn the art of swimming, for independently of the healthful exercise, it may some day be the means of saving their life. To make themselves useful, and prepare for the battle of life, let them help in household work. We have heard of a physician who prescribed the daily sweeping of an apartment with a long broom as an excellent means of expanding the chest of a

young lady; and the prescription answered. Away, at all events, with the paltry tricks which, on the ground of being fashionable, are undermining the health and damaging the prospects of that interesting section of our social system, the young ladies of England!

W. C.

YOUNG LORD PENRITH.

CHAPTER XXXVIII.—AT ALFRINGHAM.

THE third drawing-room at Alfringham, which, as has been mentioned, was so favourite a room with Mrs Stanhope, on account of her belief that its pink hangings suited her complexion, was large enough to accommodate a numerous family. It did, for a wonder, contain for the moment so many as three persons, since, besides Maud and her mother, Lord Penrith himself was there. The master of this grand house very seldom entered any of its sumptuously furnished drawing-rooms. He lived in his own suite of apartments, and was rarely seen out of them except at dinner-time, when he and his sister habitually dined alone, in an enormous room that could not be cheerful in the absence of guests, despite the array of serving-men in and out of livery, and the blaze of gold and silver plate upon a sideboard that would have graced a royal festival.

What Mrs Stanhope, naturally fond of gossip and tattle, of harmless dissipation, and a town-life, must have suffered year after year during Maud's visits at Llosthuel Court and elsewhere, and when she was compelled to dine alone with her solemn, silent brother, it would be difficult to estimate. Even the great fire of blazing logs could not in winter bring the social thermometer much above freezing-point on these melancholy occasions. There was state and splendour in abundance. The stalled ox was served without the sauce of either hatred or love, merely garnished with frigid ceremony. There would sit the old peer, eating without zest, caring little or nothing for the wines which the grave butler poured into the array of glasses before him; there on the walls, frowned or smiled a double line of pictured ancestors, as if criticising the conduct of the then tenants for life; and there was the London ex-beauty, racking her modicum of brains to find scraps of conversation that should prevent the dull meal from taking place in mere dumb-show. When Maud was at what was conventionally called her home, matters were pleasanter. Even my lord would be induced to talk a little then. For if Lord Penrith cared for any living soul, it was Maud he cared for; and any servant of the house, any agent, or tenant, or whosoever was connected with the House of Beville, would have staked his life that Miss Stanhope was the destined heiress of Lord Penrith's estate.

And now, for a wonder, Lord Penrith was in the third or pink drawing-room. He had come in, leaning on the arm of his valet; and he had been lodged on a sofa, and propped up with pillows at precisely the proper angle, near the fire; and there he was, spreading out his shrunken hands to get the benefit of the welcome heat. His lordship was always cold. His lordship was always ill, though smooth Dr Bland would have been puzzled sometimes, had

he been called upon to state before a jury of experts the precise nature of his noble patient's malady. Yet that the old lord was ill, no unprejudiced person who looked attentively at his face could doubt or deny. He was that most pitiable, perhaps, of all sights, the wreck of a strong man. Handsome he may possibly have been; but he was not comely now, as old age often is. The high forehead was crossed by a thousand wrinkles; the eyes were bloodshot, restless, and unutterably sad; and the mouth, the most tell-tale of all features, had a silent eloquence of its own which told of pain long borne, but in no spirit of resignation. Altogether it was a speaking countenance, the face of a proud man, whose very pride had been caused to sting him, scorpion-like.

'How cold it strikes!' said my lord peevishly. There was a hot fire of crackling logs and glowing embers, ruby-red, and Alfringham Hall was supplied with all manner of cunning contrivances for sending heat everywhere throughout the spacious pile; nor was the weather by any means comparable to what people mean when they speak of an old-fashioned Christmas. But Mrs Stanhope cordially agreed with her brother as to the severity of the weather; and, had he pleased to aver the Dorsetshire climate to be one of arctic rigour, his devoted sister would have been as ready to endorse the assertion as were Hamlet's courtier-friends to liken the cloud to whale or weasel as his Highness pleased. Nor was Mrs Stanhope consciously a hypocrite or a time-server, only that she had laid it down as a rule through life to defer to a brother who had so much in his gift.

Lord Penrith did not seem to care much for his sister's opinion as to the inclemency of the temperature. He was used to hear his words re-echoed, and regarded the circumstance as one of the adjuncts of his position.

'This pillow slips away each time I stir my head,' was the noble invalid's next remark. 'Jackson said he had placed it properly; but Jackson is a fool, a self-sufficient fool, pig-headed like all Cornishmen; and how I put up with him, or how the Duke bore with him, I cannot conceive, except that Glamorgan is a fool too.'

Lord Penrith, in his querulous moods, was severe in his judgments, and did not spare his own order, as his observations on His Grace the Duke of Glamorgan, K.G., and his body-servant Luke Jackson, who was as careful and considerate a valet as a nobleman needed to have about him, sufficiently proved. Maud rose, and with feminine dexterity adjusted the pillow under the old man's head.

'Thank you, my dear!' said Lord Penrith, more gently.—'Kate, have you had an answer to that letter of yours?'

'From the house-steward at Penrith House, do you mean, dear?' asked Mrs Stanhope, hesitatingly.

'Of course I do,' said the old peer tartly. 'Did you not desire him, at my wish, to get everything ready to receive us when we go up to London to-morrow, and ought he not to have sent the answer before this? Unless, indeed, Mr Smith has gone down to spend Christmas with his relations in the country, and has left Penrith House to take care of itself; which would not surprise me. Nothing does.'

Mrs Stanhope feebly suggested that the post-bag

had not yet arrived; and Maud reminded her uncle that Smith the defaulter had not as yet had time to reply in due postal course, but would doubtless do so by telegraph that day.

'Whether he does so or not,' said Lord Penrith, decisively, 'we go up to town to-morrow. My health is too precarious for me to be any longer a subject for your precious Dr Bland, Kate, to try experiments upon. Bland is a smooth-tongued charlatan, kicked out of London practice to poison us in the country. I tell you he does not understand me in the least, not in the least. Sir Joseph does. Old Sir Joseph Doublefee is a humbug; but he is a physician, and he does know my constitution; and I choose to put myself under his hands again, at least for a time. As for any other things, London will be a shade more tiresome, if that can be, than Alfringham.—Maud, would you kindly ring for Jackson?'

Jackson the valet came nimbly in response to the summons of the bell; and leaning on the man's arm, Lord Penrith tottered, rather than walked, back again to his private apartments. There was not a stable-lad or a weeding-boy employed at Alfringham who probably did not get more enjoyment out of his life than did the noble master of all.

'My poor uncle!' said Maud Stanhope, when she and her mother were left alone together; and her tone expressed a pity that was more than conventional.

'So altered—so sadly different,' sighed Mrs Stanhope, 'from his former self. In one thing, my dear, he is unchanged, and that is his kindness to me. That has been unfailing since the days when I, quite a little child, used to look admiringly up to the bold, tall, elder brother who was even then a young man; for I am eighteen years his junior, you know.'

Maud had most likely been informed on other occasions of the difference of age between Lord Penrith and his sister. At anyrate, she expressed no surprise, but merely said: 'Poor Uncle Penrith! His has been but a sad life. I never realised it, I think, as I do now.'

'How altered he is!' repeated Mrs Stanhope. 'Yet I can remember him as a handsome young man, hot-tempered, fiery, and determined to have his own way always; but generous, and not the less liked because of his strong will. His temper, poor man, has cooled itself down now to mere fretfulness; and his very pride has turned inward, and become moroseness. But it was not always so. Before the great sorrow of his life, when Marmaduke the heir was brought back to the house dead, he was so different.'

'I never quite understood that sad story, often as I have heard it mentioned,' said Maud. 'Those whom I remember to have spoken of it did so as if they feared to be overheard, like superstitious people who talk of ghosts and witches after dark.'

'It was a terrible disgrace to the family, besides the horror of the crime,' answered her mother. 'But you, Maud dear, who may come to be mistress here some day, should surely know the truth, melancholy as it is. Marmaduke, the eldest son, was his father's favourite, and in disposition very like his father—only harder and more imperious. Even when almost a child, he domineered over the whole household, I think,

and especially over his younger brother, George Beville, the—the murderer, you know’—

‘Tell me,’ said Maud, with some interest, ‘what sort of person was this unfortunate man whom you call George?’

‘I liked him,’ answered Mrs Stanhope. ‘He was a sweet-tempered boy, and grew into a young man, handsome, indeed—all the Bevilles were that—but shy, timid, and a bookworm. His father, who idolised Marmaduke, and encouraged him in his high-handed line of conduct, despised poor George as a milksop—though George was brave enough, as I remember, in time of need—on account of his preferring books to field-sports, and there was not much in common between them.’

‘Now George, as I have said, had a sweet temper, and his patience with his brother was astonishing; but sometimes it gave way, and there would be a heavy quarrel, in which, I am bound to say, Marmaduke was always obstinate, and always in the wrong. There had been such a quarrel, I recollect to have heard, on the morning of the miserable day when the wicked deed was done. The elder brother had a notion that, as the heir of Alfringham and future chief of the family, he had a right to dictate to his cadet not only what he should do, but what he should think. And poor George in the course of his reading had picked up some newfangled notions—about the poor, I believe—which vexed his father, and made his brother very angry. But the dispute this time, though loud and hot, came to an end; and both brothers left the Hall together, and apparently on more friendly terms than had of late been usual.’

‘Hours passed, and neither George nor his brother came back; but there was no uneasiness; until just before dark—’—it was winter, as it is now, and the days were short—there spread a rumour through the place that Mr Marmaduke was killed. It was too true. His body had been found lying near a stile, at the end of a footpath leading from the Ridge to the Bullbury Road. He must have been dead some hours, for he was quite cold. He had been shot through the heart. And beside him in the snow lay a pistol, silver-mounted, and with arms and initials engraved on a plate in the stock; a pistol which my nephew, George Beville, was known to have bought in London only a month before. And George did not come back, and all knew that he must be the murderer of his brother.’

‘How dreadful!’ murmured Maud.

‘Dreadful, indeed!’ replied her mother. ‘My brother’s anguish was such as we seldom behold, at least in a man. But then he had loved Marmaduke so fondly, and had gloried in the prospect of leaving an heir so worthy to succeed him in the title and property—indeed he had begun to allow Marmaduke to interfere with the management of the estate in his father’s lifetime, which many wise folks thought wrong—that the blow was hard indeed to bear. He never held up his head again.’

‘But the unhappy man who did it—George?’ asked Maud.

‘George wrote from abroad—from Paris, I think, but I am not sure as to the place—so soon, he said, as the report of his brother’s murder, and that he was himself suspected of the crime, reached him

through the newspapers. He indignantly protested his innocence.’

‘Perhaps he *was* innocent, after all,’ said Maud eagerly.

‘No, no!’ returned Mrs Stanhope, with a sigh; ‘no one could believe that. The chain of circumstantial evidence—for of course there was no witness—was too strong. There had been a quarrel that very day between the brothers, by no means the first; then there was the discovery of the pistol; then George’s absence; and then the younger brother’s interest in becoming, as Marmaduke’s death made him, heir to the title and estates. And George never ventured to come back and stand his trial. All regarded this as in itself a proof of guilt; but I, remembering his sensitive, nervous nature, and how he shrank from blame, have never been quite sure. His father was sure. He would not even consider his son’s assertions, made by letter, of his innocence, or trouble himself about the reasons George gave for his strange absence just then. He merely wrote a violent letter, cursing the fratricide, and casting him off for ever, with bitter regret that in going abroad as he had done, George should have cheated the hangman. There came back but a curt reply to this, saying that the discarded son would trouble his unjust father no more. And that was the last news of George Beville, who died, we believe, in Australia, in poverty; but even that remains uncertain.’

‘Perhaps he was innocent,’ repeated Maud thoughtfully.

THE FRONTIER-LAND.

IN this which is pre-eminently the age of travel, the frontier-land of America yields to none in the attractions which it offers to the traveller in search of adventure and sport. All of us, it is true, cannot share personally in such prairie experiences as Major Campion describes in his book *On the Frontier*; but the many debarred by the force of circumstances from such silvan delights, cannot do better than turn their backs in imagination on the comforts and luxuries of nineteenth-century civilisation, and accompany him into the land of the bison and the scarcely less savage Indian brave.

Major Campion’s party consisted of five—himself and a friend, two hired backwoodsmen, and a clever well-educated ne’er-do-weel yeleft Jack, who volunteered for the office of cook to the party. This gastronomic volunteer proved himself in fact to be no mean disciple of Soyer; although the difficulties he had to contend with in the shape of a smoky camp stove would have taken the heart out of almost any other *chef de cuisine*. The outfit, in addition to the aforesaid stove, consisted of a light covered wagon, four mules, a tent, a watch-dog, and two good horses trained to the sport of buffalo-hunting, and hence technically known as buffalo-runners. The possession of a good buffalo-runner is of the utmost importance to the would-be buffalo-hunter, as should the rider momentarily lose his presence of mind, as is not unusual with a novice when first brought face to face with the stupendous rush of an enraged buffalo, the trained horse performs his accustomed evolution, and by

a sudden spring to one side evades the murderous charge.

Major Campion bears his testimony, as almost all travellers have done, to the expansion of spirit and wonderful exhilaration of body and soul produced by travelling in fine weather through the vast plains of the western wilderness. 'Around us,' he says, 'was a rolling prairie, with an horizon like the ocean's; and a balmy, invigorating, almost intoxicating air blew over it into our faces, coming untainted and unpoisoned by the breaths, smells, and smoke of cities, from the Rocky Mountains, seven hundred miles off.'

Day after day the travellers journeyed over these grassy plains, which ever as they advanced lengthened out before them into what seemed an endless immensity of verdure; till one day scanning with anxious eyes the wide ocean of green, it was seen to be dotted with small black specks, which in the distance massed themselves into little groups, which again were defined into a dark line on the horizon. A sudden jubilant shout rent the air, for there at last were the much desired buffalo. It is one thing, however, to sight buffalo, and quite another thing to kill or even to stalk them, as our travellers found. The first thing needful was to pitch their camp. Without much difficulty a site was found for this movable hunting lodge, which was christened Camp Gibraltar; and from the top of a high tree in its vicinity an anxious look-out was kept upon the herd of buffaloes. At first they seemed stationary; but by degrees the shaggy forms of the bulls, which always feed upon the outskirts of the herds, became more distinct, and it was evident that they were slowly approaching. Soothed by visions of buffalo humps and tongues on the morrow, each aspiring Nimrod wrapped himself in his blanket and sank into a fitful but not unguarded sleep of expectancy.

A sentinel was always posted at night at Camp Gibraltar, and the sentry of the prairies be it understood has in some respects a much more arduous task than his European congener. He must in the first place neither walk nor stand; to do either would make him a sure mark for the silent arrow of the prowling Indian scout. No; he must grovel ingloriously but safely upon his stomach, hidden by the long prairie-grass—'with his elbows far apart, his wrists brought together, his chin supported on his hands, his ears open, and his eyes everywhere.'

In this position of little ease the sentry of Camp Gibraltar had been already squatting for a couple of hours on a fine moonshiny night, when he suddenly heard a sound which he could not at all make out. It was low at first and indistinct, like the faint far-off murmur of the sea; but it increased every moment in strength and volume till it sounded like the roll of distant thunder, or the roar of the surf on a rocky shore. Thoroughly puzzled, the sentinel awoke his comrades, and a hurried council of war was held. Was it a prairie-fire? No; the grass was too green for that. Was it a sudden rain-storm to the west, and was the Republican River, on whose banks they were encamped, coming down in flood, to sweep away the sandy foundations of their temporary home? This contingency was alarming enough; but after a few anxious minutes the sound was clearly perceived to come from the direction of the herd of

buffaloes; and thoroughly tranquillised by this discovery, the novices turned in again, and were soon fast asleep. Even the sentinel grovelling among the long prairie-grass owned afterwards to a few moments of profound unconsciousness, when there was a sudden crash, as if the whole universe around them were falling to pieces with a deafening roar; and with a start the inmates of Camp Gibraltar awoke. 'The scene around them was terrific. The air shivered with noise, the earth trembled under their feet. The main herd was crossing the river close to their camp. The roar of the bulls, the lowing of the cows, the tramp of thousands of feet, the splash of water as the huge mass of animals plunged and struggled through it, the crumbling fall of the bank as the buffaloes forced their way up its steep face—all were blended in one mighty tumult.' Sheer astonishment at first held them speechless and motionless; but this soon gave way to the instinct of self-preservation. They were in imminent peril; if the herd came their way, they would be ground to powder; their only safeguard was a fire, which was piled up, and fed all through that memorable night, whose long hours were spent in watching the continuous tramp and din of the ever passing, apparently interminable herd.

Major Campion says of this striking spectacle—which bids fair, from the rapid decrease of the buffalo on these western plains, to be soon numbered among the things of the past: 'I have stood on the deck of a ship aflame in mid Atlantic; I have been startled from deep sleep by the firing of rifle-balls, the quick zip-zip of flying arrows, the death-scream of a slaughtered sentinel, and the war-whoop of the Red Indian—but none of these scenes recall themselves more forcibly to me than does that midnight crossing of the Republican River by that mighty host of buffaloes in thousands.'

Next day the whole prairie was alive with them; and our traveller, after two hours of patient stalking, was rewarded by an old bull coming lumbering round the corner almost up to him, and then gently trotting off. He gave chase at once; and the wily patriarch finding his pursuer gaining upon him, suddenly wheeled round; then pivoting on his hind-legs, he lowered his head, tossed back his shaggy forelock from his fiery eyes, and switching his tail into the air, made a sudden charge, which would inevitably have ended for ever Major Campion's hunting adventures, if it had not been for the sagacity of his horse, a well-trained buffalo-runner. He had fired just before the brute charged, but without success; and now his comrade did the same, and wounded it, but so slightly, that it in no way interfered with its rolling gallop. Spurring their horses to their utmost speed, both men now gave chase, and as they closed upon the bull, fired off their pistols, wounding him as before, but failing to kill him. The horses were now thoroughly exhausted; and very reluctantly the patriarch of the prairies had to be abandoned to his fate, which meant most probably the tender mercies of the prairie-wolves; and the two crest-fallen hunters, minus hump, tongue, or juicy steaks, sneaked back to camp. Meanwhile the two backwoodsmen and Jack the cook had with a single shot killed a buffalo which had come down to the river to

drink; a piece of good fortune which, however mortifying to the *amour propre* of their masters, had the attendant consolation of buffalo-steaks for dinner, and marrow-bones which were voted delicious.

A great proportion of the buffalo-meat, all that cannot be used fresh, is jerked; that is, it is cut into strips of equal thickness and as long as possible; these are dipped into brine, laid upon a rough wooden table, under which a fire is kindled to keep off the insects, and dried in the sun.

This free jolly hunter's life at Camp Gibraltar came like all superlatively good things to an all too sudden close. One frosty night when wreaths of silvery mist were creeping up from the river in the moonlight, the sentinel, grovelling as usual upon his stomach among the long damp grass, became aware of an indistinct object approaching through the mist. Looming gigantic in the distance it resolved itself as it drew nearer into a horseman, carefully tracking in the moonlight an easily followed trail. Arriving close to the camp, where all the trails blended into one, he reined in his horse; and there, in the clear full light, stood revealed the striking figure of an Indian brave. His bow and arrows and his long thin lance hung crosswise at his back; his rifle lay athwart his saddle-bow; the fringes of his hunting-shirt and the stained feathers of his head-dress stirred and fluttered in the night-air; while he, motionless as a bronze centaur, gazed steadily in the direction of the camp. Meanwhile the sentinel in the grass above, with his rifle at full-cock and the index finger of his right hand laid against the hair-trigger, was anxiously debating the question to kill or not to kill. Prudence suggested the former alternative; but it was too like murder in cold blood; he could not bring himself to shoot, and the dusky spy was allowed to ride off in safety; but no sooner was he gone, than the camp was roused, the wagons packed, and a hasty backward march made to Fort Riley, where their safe arrival created no little sensation. They were declared 'to have crowded their luck;' and were assured that three tribes of Indians were out upon the war-path, so that the usual frontier military toast, 'The hair on the top of your head, and long may it wave there,' had a deeper significance than usual in their case.

Camping out in summer or autumn, when the wide grassy plains and clumps of forest are one mass of green luxuriance, when a thousand sweet perfumes load the air, and the verdure is brilliantly flecked and dappled with masses of gorgeously hued flowers, is a very pleasant thing. But Major Campion had experience also of a long winter-camp—out in the Rocky Mountains. He had with him his comrade of Camp Gibraltar, and two men who had long been in their employment—Joe, a big ruddy complexioned Missourian; and Lafayette or Laughfy, a tall thin sallow Yankee from Maine. They had two light strong wagons built for mountain-travel, a variety of stores, two powerful dogs Nip and Tug, and twenty beaver-traps, as they meant to trap beaver as well as hunt. They chose for the site of their winter-camp a large secluded valley called Wet Mountain Valley. It covered a tract of country forty miles long by twenty broad, and was inclosed by high rocky peaks. It was entered by a defile known as the Gate of the Plains, and was in itself a little lonely

world, composed of glades, glens, and small valleys opening into each other, with abundant willow-fringed streams well peopled with beaver. In the central valley a rude hut was built with oak and cedar branches; a great fire was laid; a hole was dug in the ground, and lined with stones for an oven; and a high platform was made where meat could be beyond the reach of wolves and pumas. The valley was then explored and was found to contain a large quantity and variety of game—white-tailed, black-tailed, and spruce deer, ashata or big-horns, elks, bears, wolves, foxes, lynx, and pumas, wild-turkeys, wood-grouse, and mountain partridges.

In this hunter's Elysium the weather continued charming and the fare of the best till close upon Christmas Day, when a foot of snow fell, and the game all disappeared, leaving them with a larder well nigh empty, and the cheering prospect of making their Christmas dinner off fat bacon and the traditional plum-pudding, the materials for which they had brought with them. This dismal look-out was a little brightened by one of the hands, who brought in word on the evening of December 23d, that he had seen wild-turkeys feeding five or six miles from the camp. Now wild-turkeys are the most wary and cautious of birds; they are as difficult to stalk as the shyest of deer; and our Major, who started in pursuit of them at daybreak next morning, had a charming day of it. Early in the forenoon he came upon the track of eight turkeys, and followed them up hill and down dale, through thickets, and across half-frozen streams for many a weary mile and hour, until at last he lost all trace of them. This looked gloomy; but there was a silver lining to the cloud, and he was cheered by finding the tracks of a large deer in the snow. Fat venison may serve at a pinch for a Christmas dinner as well as fat turkey, so he started at once in pursuit of the fresh game; but in crossing a wide stream the ice broke, and down he went waist deep in intensely cold water with a crash loud enough to startle all the deer in the valley. With difficulty he scrambled out benumbed with cold and feeling his clothes beginning to freeze upon him, but amid all his discomforts still intent upon a turkey. He was still watching and longing under the cotton-wood trees, when his comrade came up with two turkeys slung over his shoulder; and these, with two others which were afterwards secured, and a fat buck shot down by the backwoodsmen, made a very respectable Christmas dinner.

The fur of the beaver attaining its highest perfection about Christmas, exclusive attention was now given to beaver-trapping. Beavers have been often written about; but our author considers that a want of practical experience about the habits of the animals has prevented this information from being very precise. He himself has often dug up beaver-houses, and his uniform experience of them is, that the entrance is invariably a round hole, nine or ten inches across in the bank of the pool which their dams make in the stream. This hole runs back from four to ten feet into the bank, and ends in a circular basin four feet across, and four feet deep, with a vaulted roof about a foot above the water with which it is filled. The ingenious creature thus secures for itself a winter bath, in which there is no danger of the water freezing. From this bath passages lead off to the dwelling,

breeding, and store rooms of the beaver family, of which there is only one pair to each house, the old ones helping the young ones when they leave the family mansion to build one precisely similar for themselves. In autumn, they lay in a supply of winter-food, consisting of the small twigs of osiers and the inner bark of cotton-wood trees, alders, willows, and marsh-maples. Their dams have been often described; but to shew what wonderful undertakings they are, it may be mentioned that the building of them often involves the felling of a tree forty or fifty feet high, and that the beaver never fells a tree too short for his purpose, and seldom one too long. They are always built upwards from the bed of the stream, and in mountain streams are generally eight feet high. The object of these dams is to keep the water in their pools at a uniform level; and during a flood the beavers break up a portion of the dam, to allow the surplus water to escape. When the water is sufficiently extensive and unfluctuating for their purpose, the beavers build no dam. This little creature is one of the most sagacious and cautious of animals. If a beaver escape alive from a trap in one of the most frequented trapping-grounds, no more traps need be set there that season. 'Beaver-trapping,' says Major Campion, 'is a contest of acquired skill and knowledge, of patient unremitting care and attention, of energy and of endurance, versus the natural instinct, if we may not call it reason, of the most sagacious, acute, and wary of all the brute creation.'

Owing to a late and unexpected snow-storm which had driven away all the game, the camp in Wet Mountain Valley was almost reduced to the point of starvation. The hunters had little else to live upon except a handful of Indian corn served out to each man per diem, and boiled in a little melted snow-water.

In a few days, however, the two men who had been sent for succour returned with supplies, and the camp in Wet Mountain Valley was broken up, all the sooner that a party of Ute Indians appeared on the scene and soon drove away all the game.

On their way to Fort Mojave on the Colorado River they passed through a tract of sterile country, the salt desert, where the grass and sand were covered with a salt efflorescence which had the appearance of white frost. In this desolate land is Soda Lake, which at a distance looks like a clear beautiful sheet of water with patches of verdure along its banks; but which near at hand is found to be a dreary expanse of baked mud thickly covered with shining efflorescent salts, and fringed with beds of marsh-grass. After toiling at a slow pace through two hundred and fifty tedious miles, the beautiful Colorado Valley came in view. This valley, or rather succession of valleys, is fertile and well wooded, and in its upper reaches is sparsely peopled by Indian races, the Mojaves and the Apache Yumayas. With Pah Squal, the war-chief of this latter tribe, the Major and his friend partook of a very appetising meal. One dish was wood-rats, roasted in their skins, skinned, and served each on a large leaf, plump, white, and piping hot. The smell was most savoury; and the Major wisely concluded that he was safe in throwing European prejudice to the winds. 'I took one,' he says, 'seasoned it

well with pepper and salt, ate it; and hereby testify by these presents that wood-rat properly cooked is most excellent eating.' These Apaches are cool, cautious, daring savages, and determined cattle-stealers. If they once get away with a herd, it is almost impossible to recapture the lost animals. An application is usually made, it is true, to the nearest fort for a detachment of cavalry to pursue the marauders; but before the cavalry can be put in motion, one-half of the cattle are slaughtered or have fallen a prey to wild beasts; and in Major Campion's words, 'they return, men and horses done up with rapid travelling, short commons, exposure, and disappointment; so has ended many a hard scout I have been on in that desperately difficult country to campaign in—the home of the Apache.'

For those who delight in tales of wild adventure, we recommend the graphic descriptions contained in Major Campion's stirring volume.

A PIOUS FRAUD.

'GOOD-BYE!'

'Good-bye! You will not fail to come to us next week?'

'O no! Give my love to Bessie, and tell her how anxious I am to know her personally; I have heard so much of her from Joe.'

The last speaker was my wife's sister-in-law. Brother Joe, as we all call him (my wife's brother), had gone to Canada a very young man, and by steadiness and perseverance, having risen to a good position, he had in due course taken unto himself a wife. Kate Morton, our sister-in-law, was an orphan, having an only brother, who was now settled in the old country; for though he and his sister were born in the Dominion, their parents both belonged to old Essex families. Kate had already become a familiar friend to us, through the medium of the post office; and now in failing health she had visited England, *en route* for Nice, where her medical advisers had recommended her to winter.

Joe was to have accompanied her, but at the last moment, business called him away to New York; and as it was uncertain when he would be at liberty, it was deemed advisable that she should take the journey as far as England by herself, rather than risk an uncertain delay.

Her first visit, on arriving in England, was naturally to her own brother, who had settled down to the life of a gentleman-farmer at Sewardstower, and thither I had come to introduce myself to our sister-in-law.

Sewardstower—as everybody must know who knows anything about it at all—is, though very charming, by no means a popular resort. In fact, therein lies one of its charms; for though not more than an easy journey from the metropolis, no railway Company has as yet been venturesome enough to organise a series of cheap trips to it. Indeed the most modern enterprise has brought no station nearer than two miles to this earthly paradise. It is beyond the radius for pleasure-vans; and were it not, no accommodating hostelry is there to offer good entertainment for man and beast. It is not a town; you could hardly describe it as a village. It is rather an area occupied by landed gentry and gentlemen-farmers.

It is a bright moonlight night, and I have

preferred to walk to the neighbouring station, rather than allow any of Mr Morton's horses to turn out; besides, I enjoy a brisk walk at any time; and to-night the look-out from the high ground at Sewardstower, down over the wooded slopes, and away for miles across the marshy flats below, is really charming.

I have not gone very far from the house when something glittering on the roadway attracts my attention, and on picking it up, I find that it is a ring. I examine it as well as I can by the moonlight, and while I am thus engaged, a stranger overtaking me wishes me good-night. I am nothing loath to have a companion for my two-miles' walk, so I return his salutation cordially, and we are companions for the rest of the journey. My friend, from his style of dress, is evidently a dissenting clergyman. He is well informed, and inclined to be companionable; and I am delighted to find that he, like myself, is bound for the metropolis. I find that he has such a fund of general information, and we have so many sympathies in common, that before long we have exchanged cards and mutually promised ourselves the pleasure of improving each other's acquaintance.

On our way to town, in unconsciously groping in my pocket, I come upon the ring, which in the animation of conversation I had almost forgotten. I take it out, slip it on my finger, and examine it more closely. I am surprised to find that it is apparently a diamond ring, the stone of unusual size, and so far as I can judge, of great value. My friend and I have become so very confidential that I am half inclined to tell him all about it; but on second thoughts I consider this hardly prudent; so instead, I put the ring, hand and all, into my pocket again; and for the remainder of the journey am perhaps a trifle less companionable, for I am turning over in my mind what I had better do with my treasure-trove. The result of my cogitations is that the next day I send advertisements to all the leading journals, offering to restore the ring to the rightful owner on a correct description of the lost trinket being given. The external appearance of the ring is somewhat unusual—a large diamond set in a band of rubies and emeralds; but in the inside is engraved simply a date—December 12th, 1870. Here is a test that defies the attempts of any impostor.

It was not long before the first claimant appeared. A very respectable elderly gentleman called upon me that evening. He could not be sure where he had lost his ring. He had lost it he knew on the 7th of September. (Date correct.) He had been visiting friends at Walsfield and Entham that day, and had likewise made a call at Sewardstower. He could not say if he had lost it at any of these places, or in London after his return. It was a very valuable ring, but to him it was precious above all things as being a souvenir of his only son, who had been lost in a shipwreck on his voyage out to New Zealand.

The old man's half-suppressed emotion as he alluded to the sad fate of his son was so touching, that I felt it rather a delicate matter to cross-question him as to the peculiarities of the ring, seeing that the date and place of his losing and my finding it were coincidental. However, when he had quite recovered himself, he gave me a very

exact description of the outward appearance of the ring I had picked up.

'May I ask,' said I, 'if the ring you lost bore any inscription?'

'Not any.'

'It is rather odd,' I replied. 'You have given a wonderfully accurate description of the ring I found; and I am sorry it is not yours, since you have so good reason to set an additional value on it; but this ring bears an inscription.'

'Then it cannot be mine; but the ring I lost my son had made especially, and it is odd that there should be two so much alike.'

'Perhaps it might be a satisfaction for you to see this ring,' said I, producing it from my pocket.

The old gentleman stretched out his hand in eager haste, and as he did so, I observed tattooed on his wrist an anchor and the letters D. C. It seemed so out of place that I could not help noting it. He recovered himself, and apologised for his eagerness; the ring was so remarkably like the one he had lost, that for a moment he could not control himself.

After a careful examination, he returned it to me with a sigh. 'No,' he said; 'it is certainly not my ring; but it is an odd coincidence. I must apologise for having troubled you. Good-night.'

Next morning I had an early visitor. A smart business-like young man, who apologised for intruding on me at so inconvenient an hour, but he had called at my place on his way to the City. He had seen my advertisement, and had called as a forlorn-hope; not that he for a moment expected that the ring I had found was his. In fact, he had lost it in such an out-of-the-way place that it was far from likely I had been there to pick it up.

'Might I ask when and where you lost it?'

'At Sewardstower, on the 7th of September.'

Rather odd that this secluded paradise should have had so many visitors on that particular day.

'Will you describe the ring?'

'It is rather an extraordinary one—a large diamond surrounded by a band of rubies and emeralds, and inside engraved the date December 12, 1870.'

'Is this your ring?'

'No doubt of it, sir,' returned he, after a careful survey. 'This is most extraordinary! You will of course allow me to defray all expenses for advertising.'

'Of course; that is only fair.'

'I hardly know how to propose such a thing, but the ring is of considerable value. Could I not offer any reward?'

'Certainly not. But if you think fit, you may send a contribution to the Indian Famine Fund in the name of "A recovered relic."'

'I will send a cheque for twenty guineas as soon as I get to the City.'

I examined the list next morning; but found that my friend had not kept his promise. The second and third day the same. I began to suspect that he had broken faith with me.

On the fourth day, our sister-in-law arrived, and all sublunary things were forgotten for a while in the excitement of receiving her. After a long discussion on family matters with my wife, and a prolonged visit to the nursery, which is the treasure-room in our house, and an almost as pro-

longed and interesting visit to the wardrobe where Canadian and European styles and prices had to be compared and discussed—these subjects of paramount interest being exhausted, the conversation fell to the more ordinary level, and my wife gave Kate an outline of the adventure of the found ring.

'It is very strange,' said Kate; 'but my brother is in some trouble about a ring that he has lost.'

'What sort of a ring was this?'

'Oh, a very unusual one. It was an heirloom, and has been in our family for many generations. A large diamond set in a circle of rubies and emeralds.'

'Had it any inscription on it?'

'Yes. When it came into my brother's possession, he had the date of our father's death, December 12, 1870, engraved inside it.'

'Did he lose it at Sewardstower?'

'Yes; last Wednesday.'

'The seventh of this month.'

'Yes; I believe on the seventh.'

This was enough. I paid an early visit to the nearest police station; and in the course of the evening a detective was sent round to confer with me. Sergeant Rolls was a very silent man. If he entered into the case with any enthusiasm, he certainly gave no outward manifestation of it. He heard my story without comment, filling up the pauses with an occasional nod, the only variation being a shake of the head indicative of disapproval when I told him of my volunteering an exhibition of the ring to the old gentleman. He made a few memoranda in a well-worn pocket-book.

'Do you think there is any chance of our recovering the ring?'

'I can't say much about that, sir; but I think I know our man. If it is one of his jobs, he's wanted for a bigger one; but he's a rare slippery fellow.'

'I would willingly give twenty pounds to recover the ring I have so stupidly parted with.'

'If I hear anything, I will send for you at once.'

Two days later, I received an intimation that I was wanted; and on going round to the police station, I was received by Sergeant Rolls in the same quiet manner that had characterised our first interview.

'Well sergeant, have you heard anything of the ring?'

'You may set your mind at rest about that, sir. Be kind enough to step this way. Please take notice of every one you see in here; but do not make any remark until we are alone again.'

He led me into a room at the back of the court, evidently used as a recreation-room, for the men while waiting for their turn of duty. A long deal-table occupied the centre of the room, on which were scattered newspapers, publications, chess, draughts, and dominoes. The whitewashed walls were ornamented with maps, illuminated texts of Scripture, and a framed copy of police regulations for the private instruction of the force.

Around the table were seated five men in plain clothes, and on duty were two policemen. With one of these Sergeant Rolls entered into an inaudible conversation, while I made my survey of the other occupants of the room. I thought them on the whole rather a villainous company, but probably my mental vision was distorted by

the influence of the place. The first two I dismissed after a very brief survey; but I could hardly suppress a start as I recognised in the third the smart young man who had so adroitly gained possession of the ring. Very disreputable were his looks now; but a sojourn in a police cell is rarely advantageous to one's toilet and general appearance. The fourth called up no memories in me; but I had a haunting recollection of the face of the fifth. He was certainly the most respectable-looking of them all—an elderly, gentlemanlike man. Could it be possible that he was the plausible patriarch who had beguiled me into displaying the private marks on the lost ring?

A look of intelligence from Sergeant Rolls, and he passes out of the room, I following.

'Well?'

'The first, second, and fourth I have never seen before.'

'Very likely not; they are three of our own men.'

'The third is beyond a doubt the man who got the ring from me.'

'Very little doubt of that, sir. We have the ring; and it will be restored to you in due course.'

'The fifth I am not sure about; but I strongly suspect him of being the old gentleman who called upon me the evening before I parted with the ring.'

'Steady there, sir; steady! That's our district superintendent. Our books here will prove an alibi for him if necessary.'

'But I am sure I have seen the face before.'

'Very likely. He took down the information the first day you came to us; but he was in uniform then, which makes all the difference.'

'To be sure,' I exclaimed, my memory being recalled to the circumstance.

'Let me see,' said Sergeant Rolls, producing his pocket-book. 'I think you described some peculiar marks on the old gentleman's wrist.'

He walked over to a speaking-tube in a corner of the room; and almost immediately after he had taken it into his confidence, the occupants of the adjoining apartment began to file out. As number three left the room under careful escort, the sergeant brought him forward into the bright light.

'Turn up your right cuff.'

The order was sullenly obeyed; and what was my surprise to see the tattooed anchor and D. C., which had distinguished my first visitor. At a signal from the sergeant he was again removed.

'You are rather surprised.'

'I confess I am.'

'The man's career has been very extraordinary, perhaps one of the most remarkable biographies in our strange library. Educated at Eton, he believed that a naval career was the most suitable for him. His friends had different views; and as they would not purchase him a commission in the navy, he shipped in the merchant service on his own account. One voyage convinced him that his friends were right; but he was too much of a Bohemian to settle down in respectable society and go in for the Church, as his people wished. The first time he came under our notice was as a "drunk and disorderly," and very often afterwards we had him as a lodger. At that time he was an actor, and of unusual talent when he was

sober, but so unreliable, that he could get no employment except at second or third rate houses, where they were glad of something superior at a small salary, and where his audiences rather enjoyed the excitement of an occasional rumpus, when his potations left him in an obstinate or quarrelsome humour. He always had a contempt for his supporters, and having lost their favour, the temple of the drama speedily closed its doors on him. He had a hard life of it for a while; but suddenly he took a sober fit, and we lost sight of him altogether. By-and-by a number of impostures, robberies, and other matters of that sort puzzled us for a while. The individuals connected with them answered to different descriptions; but from a professional point of view, we soon detected one hand at work through them all. We got enough information to give us a strong suspicion that our old friend was using his acquired experience in making up and playing a part. He is a slippery customer, however; and I don't know if we should have landed him now had it not been for your ring.'

'How did you discover it?'

'Ridiculously simple. He had just completed a big job that had occupied him some time, and which had necessitated his being a strict teetotaler for a few weeks, and pretending an unusual amount of morality. I suppose this was so unpalatable to him, that he had given way to his old vice, and in an unguarded moment he was flashing about the ring. His old experience of the Brummagem gems which he wore in big theatrical parts, had given him a weakness for jewellery.'

'I suppose I will be bound over to prosecute?'

'I don't think so. The fact is he was wanted for the big job I spoke of just now, if we can bring it home to him. A very clever thing it was too. Would you like to hear of it?'

I am surprised to find that the taciturn sergeant can be so talkative, and encourage him to proceed.

'Well, sir, Mr — is a very earnest, pious gentleman, and does a power of good in his part of the country. He is very wealthy, and anybody who has a really benevolent scheme is sure of a hearty welcome at his house. Our friend, by means of a forged letter purporting to come from one of the great American revivalists, introduced himself to Mr —, and was received with open arms. He must have played his part to perfection, for his host keeps open house at all times to clergymen and missionaries of all denominations. When he had his plans thoroughly matured, he organised a meeting, to which all the neighbourhood was invited, and in which the servants of the household as usual took part.

'The singing was evidently to be the signal for his confederates.—You may have attended some of the services at the Agricultural Hall, and know with what hearty good-will the hymns were always rendered.—The coast was clear, the whole household being in the dining-room. The noise of the singing was ample enough to drown any that might be made by the burglars, and so many of the neighbours were present, that the chance of disturbance from without was reduced to a minimum. By the time the benediction was pronounced, the house had been stripped, and the robbers were fairly on their way to the purlieus of Whitechapel.'

'Where and when did this happen?'

'At Sewardstower, on the evening of the 7th September.'

'I must have come up to town that night with one of the ministers who had attended the meeting.'

'And you gave him your card?' said Sergeant Rolls with more eagerness than he was wont to display.

'Yes,' said I; 'we exchanged cards in the train.'

'Do you happen to have his?'

I find it in my pocket-book, and hand it to the sergeant.

'The Rev. Timotheus Bracebridge. The very man. One of the cards he must have had printed specially for this job. You did not mention this meeting to me when you stated your case.'

'I hardly thought of it, and did not see what bearing it could have on the subject.'

'How did you suppose that the old gentleman was able to give you so accurate a description of this remarkable ring?'

'I see it all now. I remember taking it out of my pocket in the train. How clearly it has all come out!'

'Yes; I think that the two cases dovetail beautifully. The fact is our friend has so thoroughly taken in Mr — that he thinks we are on the wrong scent. But the circumstantial evidence is pretty strong now.'

I have no intention to take the reader through all the lateral circumstances connected with the memorable trial which followed, the details of which are foreign to my story. Suffice it to say that in the able hands of Sergeant Rolls the clue afforded by the recovery of the ring was so vigorously followed up that in a week's time the whole gang were in the hands of justice. Mr —, much against his will, was convinced of the perfidy of his protégé, who has now resigned his many aliases for the permanent title of 'No. 9247,' and whose ingenious making-up will for the future be restricted to the monotonous one of a close-cropped wig and an unbecoming suit of gray.

Reader, the moral of this story is evident: beware of submitting your valuables to the scrutiny of a stranger.

HAPS AND MISHAPS OF LAND TELEGRAPH LINES.

IN a former number of *Chambers's Journal*, No. 708, we recorded the haps and mishaps which commonly befall a submarine cable buried in the depths of the sea. Our present purpose is to give an account of the contingencies which occur to an overland telegraph erected in the air. The haps and mishaps of submarine cables have proved themselves to be of a kind totally unexpected by even the highest authorities on the subject; and although, from the exposed nature of land-lines, many of the ills which they are heir to might have been anticipated, still we may be able to shew that there are some curious experiences in their lot, which even the wisest could not have foretold.

One of the worst enemies to the telegraph wire in various parts of the world is man himself. Even in civilised countries, the soot from chimneys and railway trains is ever settling on the little

cups which insulate the wire from the poles and the ground; shreds of twine or cloth, and kites' tails, are constantly getting entangled in the wires, and connecting them to each other or to the supporting poles, so as to make the current leak from one wire to another, or to the earth itself. Mischievous boys are occasionally guilty of throwing stones and breaking the insulating cups, or climbing the posts and cutting the wires. These, and the evils which sometimes arise from snow-storms, are among the chief mishaps to which our overland telegraphs are liable.

It is in wild countries however, and from savage man, that the telegraph encounters its most dangerous foes; though at the same time, less trouble has been met with amongst the barbarian races through whose territories the telegraph has passed, than was formerly expected. The two great causes of this comparative immunity from trouble are 'backsheesh' (money donations) and superstition. The most suspicious natives soon found that once the line was erected it was a very harmless affair, and they were none the worse for it; while the money paid to them to make them respect the line was very easily won, and very welcome. When the great Indo-European line from England, *via* Russia and Teheran, to the head of the Persian Gulf, was made, the wild Arab and Tartar hordes of the Euphrates Valley were soon quieted by an annual backsheesh to their sheiks. In Senegal the wooden posts are often burned by the natives firing the tall grass of the hills; but this is mere accident, as they have a superstitious dread of what they term the white man's talking-jumbo. It is a powerful and malignant 'fetich' to them, which they would not willingly meddle with. Similarly, a number of the North American prairie tribes, such as the Navajoes, regard the line with a reverence highly creditable to them as a race; and it is remarkable that during former troubles with the Kaffirs, the fierce Galeka and Gaika warriors left the frontier telegraph wires almost entirely unmolested.

The strongest opposition to a telegraph line from uncivilised races is always met with when it is first erected. Fear of the strange thing, and jealousy of territorial encroachment, naturally excite the savage mind to resent the innovation; and most construction parties in wild countries have to be protected by an escort of troops. The great trans-Australian overland line recently completed, was carried for hundreds of miles through desert solitudes, unharmed by the blacks; but on the Macdonald Range a band of hostile natives were encountered; and the electricians gained a bloodless victory over them by connecting the poles of a powerful battery to the wire, and administering shocks unawares to those of the natives who were prowling curiously around. The mysterious power, which seemed to them like a thunder-stroke, inspired them with a wholesome terror of the wire, and they gave it a wide berth ever after. Both in Australia and New Zealand, several erecting parties have been attacked by the aborigines and massacred. Of late however, in New Zealand the Maoris have shewn a different spirit, probably because of a better management on the part of the whites; and Maori squatters now help to build the line, which they look upon as a triumph of their scientific abilities.

The telegraph line has very often to suffer from

the thievish propensities of natives. The Arabs of the Nubian desert are continually stealing the wire of the line which runs from Cairo to Khartoum on the Blue Nile, for the purpose of pointing their spears. In India the sepoy cut the lead soldering from the insulators to make slugs of it; and the Chinese have long regarded the wire as a very convenient source of tea-box nails; while some of these childlike individuals caught in the act of cutting down the posts have been known to plead that they thought they grew there. The Celestials have hitherto shewn a peculiar spite against the telegraph, both cable and land-line; and it is satisfactory to learn that they are now much better disposed to it; the telephone having opened their eyes to its advantages. The fact is, they did not understand the former telegraphs, and they were unsuited to the Chinese language, which has no alphabet. But now the telephone enables them to converse, and transmits with peculiar fidelity the metallic twang of their monosyllabic language. They are vastly delighted with it, and have just discovered for the first time that it was originally Chinese, having been invented in the year 960 by Kung Foo Whing; an announcement which will satisfy their self-complacency, without disturbing the equanimity of Professor Bell.

On one occasion the wires of the Pagoda Company having been repeatedly cut and stolen, the Chinese Board of Foreign Trade issued a proclamation to the following effect: 'These fellows really shew an inveterate and detestable love of mischief. Although telegraphs are a foreign invention, still the line has been purchased by the government, is managed by the government, and is government property. The laws shew no leniency to those who steal goods belonging to the government. Telegraphs are war material also, since they are used in times of war for transmitting military messages; and people stealing war material are liable to severe punishment. The authorities might seize and punish these persons rigorously, but forbear because of their ignorance. All of you were originally good; how is it that you do not shew any self-respect? Fathers must warn their sons, and elder brothers their younger ones, to prevent violation of the laws. People found stealing wire will be seized, tried, and executed on the spot as a warning to others. For the apprehension of such persons two hundred dollars reward is offered. It will be impossible to shew mercy hereafter. Therefore let everybody ponder over this three times, that he may have no occasion for repentance afterwards. Tremble and obey!'

The American civil war first introduced the plan of 'tapping' the wires, and abstracting or eavesdropping a message, which now plays an important part in all military operations. One of the first acts of a hostile army in an enemy's territory is to cut the telegraph lines. Even the Sepoys in the Indian Mutiny knew the advantage to be gained from this, and native troopers had to be kept patrolling the lines in order to protect them where possible. A line can be 'tapped' without cutting the wires, by simply connecting another wire on to the line and joining the instrument between this branch wire and the earth. The 'circuit' necessary for the transmission of the fluid is thus made, and messages can be intercepted in their progress to places beyond.

Mademoiselle Dodu, the superintendent of a French telegraph station, was decorated with the Legion of Honour for the patriotic crime of having, at the risk of her life, intercepted a despatch between two German generals during the Franco-Prussian War. This tapping of the wires is sometimes practised in America for fraudulent purposes. A few years ago there was a notorious mining case being tried in Virginia City, Nevada, in which the title to a mine, valued at fifty million dollars, was in dispute. The future market-value of the stock in San Francisco depended entirely on the result of the suit. If the prosecutor won, the stock would fall; if the defendant won, the stock would rise. If one of the 'mining sharps' in San Francisco could obtain reliable information of the decision of the court a few hours in advance of the others, there would be 'millions in it,' as the Americans say. A telegraph operator accordingly agreed to furnish one of the leading stockbrokers in San Francisco with the desired information; so, dressing himself as a gold 'prospector,' and taking a portable apparatus with him, he set off to the hills, and took up his quarters in a deserted hut near the line. He attached his instrument to the line by a loop of wire, so that the messages were diverted through his instrument, but not necessarily checked, as they passed on their way. By this plan he followed the development of the trial from the nature of the messages passing over the line. And when the final result came along, he connected his instrument to earth, and completely intercepted it by playing for the time the part of the receiving-operator at San Francisco. When he had done this, he took on himself the rôle of the Virginia City sending-operator, and sent the message on to San Francisco to the broker with whom he had arranged. By this piece of clever rascality he gained a fortune of twenty thousand dollars.

The troubles caused by the animal creation in primeval countries, and especially in the tropics, are of a more varied and curious character than those due to man. The termites or white ants, the curse of these regions, ruin the wooden posts in a very short time, and either posts impregnated with creasote or poles of iron have to be adopted, although at greater primary expense. In Java the wires are carried on the living *kapas* trees pruned of all their branches. Such is the vitality of the tree that the trunk continues to grow, putting out horizontal sprouts at its top, and the living pole is proof both against dry rot and termites. In India, the crows have been known to collect the odd ends of wires cut off in erecting a line, and build their nests between the posts and wires with them, thus destroying the insulation of the line. Similarly, wasps' nests, often dropped by birds of prey on the wires, monkeys playing at gymnastics, frequently cause a serious leakage of the current; and freaky elephants, rejoicing in the strength of their trunks, occasionally feed their vanity by uprooting dozens of poles right off. On the plains of the Far West, the shaggy bisons find a welcome scratching-post in the poles of the overland lines; and as bisons scratch with extraordinary vigour, they soon loosen the poles, and level them with the ground. An ingenious Yankee hit upon the idea of driving sharp spikes into the poles to keep the buffaloes

off; but what was his surprise when he found that they ever after selected the spiked posts as a currycomb, and left the plain ones alone. The large number of prairie hens killed by flying blindly against the wires has often been remarked by travellers. Even in England a similar fate occurs to sparrows, partridges, woodcocks, and other birds, numbers being annually killed by flying against the wires. Such haps as these should, however, be entered in the other side of the ledger, since it is the wires which inflict them on the animals.

Though the foregoing foes are at times exceedingly trying to the working power of the telegraph, they are simple compared with the ravages committed by the action of the elements. Their influence is ever at work, slowly and imperceptibly, or sudden and violent. The posts rot away in five or six years even in dry countries, unless preserved by impregnated creasote oil or other preservative. The wires rust in the open air, especially along railways and in cities, where steam and acid vapours corrode them rapidly. In some situations a wire will rust through in a few years; in others it will last for forty years. Lines along the sea-coast preserve well; but lines in the warm, humid tropics decay very quickly. Gales of wind often level dozens of poles at one swoop; and the tangle of wires falling across railways has been known to throw a train off the rails. During some of the severe sleet-storms of the northern United States and Canada, the wires and poles, burdened by the frozen sleet and strained by the blast, have given way over the whole track of the storm, and rendered it necessary to re-erect nearly two hundred miles of line. A mishap which is often brought about by high winds, in the forest tracts of America, but which also results from forest fires and natural decay, is the falling of trees across the wire, which either breaks it or levels the poles to the ground. Generally however, there is a track fifty feet wide cleared of trees and brush, for the line to run through, and the wire is loosely hung in the insulator so that it will yield to a falling tree and not break. In Brazil this track requires to be eighty feet wide and constantly lopped clear. When we consider the enormous amount of labour involved in this clearing on each side of tropical lines, together with the proposal recently made, to carry a land-line through Central Africa from Khartoum to the Cape Colonies, we may well shrink from the danger and expense of the undertaking.

We come now to the last and the least understood source of trouble to land telegraph lines, 'lightning' and 'earth currents,' those rushes of electricity in the air above or the earth beneath us. Until recent times a single lightning flash would destroy hundreds of telegraph-poles in this country; but now every pole is protected by a lightning-rod, which conveys the dangerous fluid to the ground. In America, however, where they do not uniformly protect their poles in this way, great numbers are still shivered in pieces by the discharge. In India, lately, on a line near Calcutta on which lightning-rods are not fixed to every post, some twenty posts were destroyed, and the solid porcelain insulators were shattered by the flash in passing from the wires to the posts, thus overcoming a resistance

equivalent to several million miles of telegraph-wire. 'Earth-currents,' as they are technically termed, are always traversing telegraph-wires in greater or lesser strength, but they are usually so feeble as not to interfere with the working of the telegraph instruments. They are sometimes caused by thunder-clouds in the atmosphere, and sometimes by some unknown cosmical influence. They frequently precede or accompany earthquakes, the aurora borealis, or disturbances of the earth's magnetism. On the evening prior to the Indian earthquake of December 14, 1872, the earth-currents were so powerful on some European lines as to stop all telegraphing for several hours. The Egyptian earthquake of January 12, 1873, was preceded for some days by strong earth-currents on the Valentia to London line. This earthquake was accompanied by an eruption of the Skaptar Jökul volcano in Iceland.

As the barometer foretells the approach of the storm, so does the galvanometer herald the aurora borealis. This telegraph instrument, which we have described in former articles, predicts magnetic storms and auroras by the earth-currents traversing the wires. Sometimes these currents are as strong as the current from a battery of two thousand Daniell-cells; and when we take into account the fact that only some twenty or thirty cells are necessary to work the instrument on an ordinary line, we can form an idea of the power of these usurping interlopers. They are rarely steady during an auroral display, but are perpetually changing in strength and sign every minute or two, in accordance it is believed with the fluctuations of the auroral streamers. During the great aurora of 4th February 1872, which was visible all over the northern hemisphere, the telegraph lines in every part of the world, cables and land-lines, were possessed by currents so powerful as to overcome all instrument work and interrupt the message traffic for hours. On the French Atlantic cable, sunk as it was at the bottom of the ocean, earth-currents were flowing all night equivalent to the current from ninety Daniell-cells. At Toronto the telegraph instruments for a long time were enveloped in a blaze of light, and sparks could be drawn from any part of the circuit. Most of the English lines stopped working from 4 P.M. 4th February, to 2 A.M. next morning.

These earth-currents, even when they are comparatively weak, play strange freaks with the telegraph instrument. Signals made by no human hands, are motioned; bells are rung; and inflammable material is ignited by their mysterious agency. When very powerful, as for instance during thunder-storms and auroras, they destroy the magnetism of the instruments, or fuse the metal-work, and sometimes set fire to the office. It is not uncommon for the spark caused by an earth-current to set fire to the cotton tape of the connecting wires within the office, and from this beginning the fire spreads.

The saddest mishaps of all which attend these intense earth-currents are the injuries to life and limb which sometimes take place, especially in America. Thunder-storms are often very violent there, and it is the custom to cut the instrument out of the line circuit on the approach of a storm, at the same time keeping the lightning-protectors on the line. These precautions are not always

taken in time however, and sometimes an operator gets a thumb or finger burned off by a great spark from his signalling-key, or is blinded and deafened by the shock. Every now and again one hears of operators being killed outright by the induced lightning-stroke proceeding from their apparatus; and perhaps the most melancholy of these was the case of Miss Lizzie Clapper, a young lady operator of Readville, United States, who, during a thunder-storm, was sitting at the window too near her apparatus, when the lightning leaped from the instrument to her neck, a distance of about a foot, and killed her instantaneously—a painless yet a dreadful death. Thus we see that the subtle fluid, to which we give the name of electricity, is an agent which, while it has been rendered subservient to man's convenience and even to his safety, is, when uncontrolled, fraught with terribly disastrous consequences.

CURIOUS HABITS OF AMERICAN ANTS.

THE Rev. H. C. M'Cook, an American entomologist, has made a series of observations on the social and domestic economy of various species of American ants. His enthusiasm in behalf of his industrious friends is so great that he actually pitched his tent in the midst of the huge mounds of certain species in one of the western states, and had to engage a small army of three men to drive off the attacks of the indignant insects while he was studying the interior arrangements of their elaborately constructed houses.

The agricultural ant—and the remark applies to all other ants of which Mr M'Cook has knowledge—is one of the neatest of creatures in its personal habits. He thinks he never saw one of his imprisoned harvesters in an untidy condition. They issue from their burrows after the most active digging, even when the earth is damp, without being perceptibly soiled. Such minute particles of dirt as cling to the body are carefully removed. Indeed the whole body is frequently and thoroughly cleansed, a duty which is habitually attended to after eating and after sleep. In this process the ants assist one another, which makes the general 'washing-up' an exceedingly curious sight to witness. In order to observe their habits closely and at his leisure, Mr M'Cook took home with him a collection of what are termed agricultural ants; and the observations he made with regard to their 'toilet habits,' as he calls them, are exceedingly curious and interesting.

In the evening, when the lamp on Mr M'Cook's table was lit, he had leisure to watch his insect friends in the act of cleansing each other, the operation being conducted as follows: The ant to whom the friendly office is being administered—the cleansed, she may be called—is leaning over upon one side as the observation begins. The cleanser—as we may name the other party—is in the act of lifting the foreleg, which is licked, then the prothorax, then the head, after which the cleanser leaves the cleansed to operate upon herself. This process may be seen throughout the entire group of assembled ants. Take another couple; the cleanser has begun at the face, which is licked thoroughly, even the mandibles or jaws being cared for, they being held

apart, for convenient manipulation. From the face the cleanser passes to the thorax or middle part of the body, thence to the haunch, and so in the same manner along the first, second, and third legs, next around to the abdomen, and thence up the other side of the ant to the head. A third ant may approach and join in the friendly task, but soon abandons the field to the original cleanser. The attitude of the cleansed all the time is one of intense satisfaction, quite resembling that of puss when one is scratching the back of her head. The insect stretches out her limbs, and as her friend takes them successively in hand, yields them limp and supple to her manipulation; she rolls gently over upon her side, even quite over upon her back, and with all her limbs relaxed, presents a perfect picture of muscular surrender and ease. The pleasure which the creatures take in being thus 'combed' and 'sponged' is, we can readily believe, really enjoyable to the observer. Mr M'Cook had seen an ant kneel down before another, thrust forward the head, drooping, quite under the face, and remain there motionless; thus expressing as plainly as sign-language could, her desire to be cleansed. The supplicated ant quite understood the gesture, for she at once went to work. If analogies in nature-studies were not so apt to be misleading, one might venture to suggest that our insect friends are thus in possession of a modified sort of emmetonian Turkish bath.

The acrobatic skill of the ants, which had often furnished Mr M'Cook amusement, was fully shewn one morning in these offices of ablution. The box containing an ant's nest was taken from his study, where the air had become chilled, and placed in an adjoining room upon the hearth, before an open grate fire. The genial warmth was soon diffused throughout the nest, and aroused the occupants to unusual activity. A tuft of grass in the centre of the box was presently covered with them. They climbed to the very top of the blades, turned around and around, hanging by their paws, not unlike gymnasts performing upon a turning-bar. They hung or clung in various positions, grasping the grass blade with the second and third pairs of legs, which were spread out at length, cleaning their heads with their fore-legs, or bending underneath to comb and lick the abdomen. Among these ants were several pairs, in one case a triplet, engaged in the cleansing operation above described. The cleanser clung to the grass, while the cleansed hung in a like position below, and reached over and up, submitting herself to the pleasant process. As the progress of the act required a change of posture on the part of both insects, it was made with the utmost agility.

The ants engaged in cleaning their own bodies have various modes of operating, all very curious, but which space prevents us from detailing.

Mr M'Cook made a series of experiments upon two species of ants, as to the mode of recognising each other, and distinguishing fellow formicarians from congeners of alien nests. It seems there is a kind of ant very common in many American towns popularly known as 'Pavement ants.' Early in the spring, he tells us, as soon as the season has gathered a comfortable degree of warmth, the insects are seen issuing from the gravel or soil of garden-walks, or from the earthen

seam that binds together the bricks of the pavement. The chief characteristic of these ants, not unlike their fellow-creatures of the genus *homo*, is their martial instinct. Hundreds, even thousands of them may often be seen waging battle with great ferocity and persistence. One battle, Mr M'Cook tells us, which was waged close by the wall, within the inclosure of a church in Philadelphia, was prolonged for a period of two weeks and several days. At least the same spot, during that period, whenever observed shewed always the same phenomenon of a battle-field, the combatants of which were apparently the same. Two points have arisen concerning these Amazonian emmets—for they are veritable Amazons, the warriors being composed wholly of workers or neuters, which are undeveloped females.

First, why do they fight at all? They are of one species, apparently of one formicary or nest. Their very first act, according to Mr M'Cook, upon issuing from winter-quarters, is to engage in this war, which is often well-nigh a war of extermination on both sides. Frequently throughout the season, these hostilities are renewed. If the individuals be of one formicary, Mr M'Cook suggests that this is Nature's mode of either distributing the species from the home-centre, by causing the worsted party to emigrate; or, if the combatants be of separate, adjoining communities, a process by which the surplus population is reduced and kept within bounds, much to the future comfort of the survivors, and more to the satisfaction of man. This, of course, is only conjecture.

A second question, even more interesting and more perplexing, Mr M'Cook asks, and tries to answer—namely: How do the combatants recognise friend from foe? They are all alike, indeed even more alike 'than peas in a pod,' as the proverb goes. Take a group of combatants into the hand, put them under a magnifier, and the most careful observer will not note the slightest difference between the individuals of the two factions. Yet do they infallibly distinguish between the parties, recognising at once members of their own formicary, and with equal certainty those of the enemy. While watching an ant-battle, according to Mr M'Cook, individuals will frequently be observed running to and fro, challenging, by certain movements of their antennæ, all whom they meet. As one ant meets another, these organs touch and embrace the face; if the parties be friends, they pass on; if foes, they straightway interlock mandibles and 'fall to.' Here we will see many scores of ants struggling together in a heap that is chaos to mortal eyes, but which seems to the tiny combatants to present no difficulties in the way of recognition. Smaller groups are scattered over the battle-field, often aggregated as follows: two individuals in combat are joined by a third, who applies her antennæ, distinguishes the enemy, and falls upon her. A fourth, fifth, many other ants, will sometimes be found massed upon one poor warrior, who is literally being torn limb from limb. Other groups are composed of several members of one faction and many of another.

It occurred to Mr M'Cook that this recognition was based upon a certain odour which in different degrees of intensity is emitted by the respective factions; or, which seems less likely, upon the presence in the individuals of two

distinct odours. This degree of odour, or difference in odours, he supposed might be dependent upon some temporary difference in the physical condition, age, or environment of the antagonists. Supposing that there were any basis of truth in this theory, it further occurred to him that the presence of an artificial and alien perfume of sufficient strength to neutralise the distinctive animal odours, or degrees of odour, and surround the combatants with a foreign and common odour, would have the tendency to confuse the ants and disturb or destroy their power of recognition. In which case he conjectured that the result might be their pacification and reconciliation. He therefore made the following experiments.

First, he collected a number of combatants from a battle which was being fought upon a flower-border, close to a fence, at his residence, and placed them together in a glass jar upon some soil. He shook the jar vigorously several times, so that, if possible, the mechanical agitation might separate the combatants. The ants emerged from the soil and continued the fight. When the surface of the earth was well covered with them, and the battle was again at its height, Mr M'Cook introduced into the jar a pellet of paper saturated with eau de Cologne. The effect was instantaneous. The ants shewed no signs of pain, displeasure, or intoxication; indeed, some ran freely over the paper. In a very few seconds the warriors had unclasped mandibles, released their hold of enemies' legs, antennæ, and bodies, and after a momentary confusion, began to burrow galleries in the earth with the utmost harmony. On the part of some there was the appearance of their escaping from the artificial odour; but there was no renewal of battle. The quondam foes dwelt together for several days in absolute unity and fraternity, amicably feeding, burrowing, and building. Thus the perfume of Cologne proved an eminent pacificator of the contending emmets, and so far verified Mr M'Cook's theory.

A second experiment was tried in another glass jar, with a like result. There was one exception; two ants continuing to fight after the perfume was introduced. After closer examination, Mr M'Cook found that one of them was nearly dead, and was holding fast an antenna of her enemy with a death-grip, from which escape was impossible. Three days after this he decanted the contents of this jar, ants and soil, into jar No. 1, and the two parties fraternised completely.

A third experiment was made. A large number of the warring ants had been lifted into a box, partly filled with soil, which communicated by a glass tube with a smaller box. The larger box was about ten inches long, and eight inches in depth and width; both boxes had sliding glass covers. The original purpose was to observe the battle at leisure, determine how long the creatures would fight, and also if eventually the parties might not separate, and the defeated retreat to the smaller box. However, Mr M'Cook concluded to follow up the above observations, and abandoning his original purpose, introduced Cologne as before into that end of the box in which the combatants were principally engaged. The same effect followed. In less than two minutes every sign of hostility had ceased, except in the case of two pairs in that end of the box, and of one small group and two single combatants in the opposite end. The two

pairs proved to be in conditions similar to the exception above noted, and a small pellet of perfumed paper dropped in the opposite end of the box dispersed the warriors there. Previous to this, occasional stragglers had passed along the connecting tube into the smaller box. Most of them seemed to be of one faction, only one of the opposition having entered, upon whom six or eight ants were expending their wrath. This was the only remaining centre of strife when Mr M'Cook replaced ants and earth upon their native territory. The battle was continuing there, between greatly diminished numbers of course, after the removal of the large battalions into the box; but the application of a feather dipped in eau de Cologne to the neighbourhood of the warriors caused the instant cessation of strife.

Mr M'Cook next directed attention to the large Pennsylvania Carpenter ant, and made a series of experiments of the same nature as the above. In his study he had an artificial formicary of these insects, which had been sent to him from the Alleghany Mountains. The ants had been taken from a branch of an oak-tree in mid-winter, and were sent frozen up within a section of the formicary. This section was about one foot in length and seven inches in diameter. The most of the ants were removed from the nest and placed in a glass bottle, to all appearance quite dead. On entering his study the following morning, Mr M'Cook was surprised to find that the ants had revived in the heat of the room, had cut a clean tubular hole through the cork, and were crawling over the lips and sides of the bottle, just ready for an emigration. They were deposited in a large glass jar, and were the subject of various experiments, until the death of the queen, eight months thereafter. Among these were the following, by way of testing the theory above stated concerning the recognition of alien ants. First, Mr M'Cook placed in the formicary, which at the time consisted of a piece of the original branch-nest planted upon several inches of soil, some individuals of the same species taken from trees in Philadelphia. These were instantly attacked, and were beheaded, that being the favourite mode of dealing with aliens among these Pennsylvania carpenter ants. Individuals—still alien, but of the same species—were then thoroughly covered with the perfume of eau de Cologne and put into the formicary. They too suffered decapitation. Individuals were then taken from members of the formicary, subjected to the Cologne fumigation, and restored to the nest. They were welcomed home unharmed. The whole formicary was then strongly perfumed by means of cotton pellets soaked in the perfume, and alien ants of the same species, which had been treated in the same way, were put into the midst of their mountain congeners. The result which had followed in the previous experiments appeared once more. The intruders were not attacked with quite the same promptness; but in the end they were brought to the mandibular guillotine, and their carcasses deposited in, or rather on, the cemetery which these insects are nearly always sure to establish when there are numerous deaths among them or on their premises.

THE TWO CROSSES OF HONOUR.

AMONGST the Orders and Crosses bestowed as symbols of merit, the Legion of Honour and the Victoria Cross hold the foremost place, and their true nature is worthy of being popularly known. The Legion is not quite so exclusive an Order as the Victoria Cross; for it is not confined to deeds of valour, but is bestowed upon all, soldiers, sailors, and civilians alike, for all kinds of service to the state—military, naval, political, or scientific. It is much respected by the French people, who eagerly and persistently seek for the honours which the wearing of the 'red ribbon' confers on its possessor. The Legion of Honour was founded in 1802 by Napoleon Bonaparte when First Consul, for the express purpose of rewarding all civil and military merit; and it superseded all the monarchical orders, which had been abolished by the Revolution. Napoleon intended at first that the Legion should have a white ribbon as the emblem of purity; but this being the colour of the Bourbons, red was chosen instead, although this was already worn by the Knights of St Louis.

The Order acquired great lustre during the reign of Napoleon I.; for at the period of his captivity and final exile, six thousand Frenchmen had acquired it, and out of this large number five thousand had received the distinction for bravery on the field of battle, the honour being enhanced in many cases by the fact that the great Emperor often conferred the insignia with his own hand on the spot, immediately after the deed was done which had earned the honour; at times even taking the golden cross from his own breast to place it on that of a common soldier. On the restoration of the Bourbons, the old monarchical Orders were revived; but the Legion of Honour had so entirely supplanted them in the affection of the people at large, that it was deemed prudent to continue it as the chief national reward for services rendered to the state. In such esteem was it held at this period that sentries were obliged to present arms to all bearers of the celebrated red ribbon; and

this compliment was paid to the members of the Legion up to the year 1824, when the number of 'legionaries' having increased to twenty-eight thousand, it was found that the work of saluting was growing very onerous for the sentries—that in fact there was too much 'saluting' going on—and the somewhat absurd system was suddenly discontinued.

Louis-Philippe, the 'Citizen' king, abolished the old Orders, and retained only the Legion, and this he distributed so indiscriminately as to raise the number of members in a very short time to more than fifty thousand. After his flight from Paris, the Order was suppressed by the Republican government; but was revived by Napoleon III., under whose *régime* it became the vehicle for bribery and corruption of the most flagrant kind. Though endowed with a new set of rules, ostensibly to purify it, the Legion was used to decorate men of the most questionable character; and any political service rendered to the Emperor or his ministers was, apart from its nature, almost certain to be rewarded by the bestowal of the famous red ribbon. It was never more fairly bestowed however, than when it graced the breasts of the bronzed heroes of the Crimean War; and so long as the Order was kept for purely military purposes, its value and character were beyond question. The French greatly esteem it, as shewn by the fact that the late President of the Republic, M. Thiers, who during his term of office never wore any uniform whatever, always bore in the button-hole of his plain frock-coat the red ribbon of the Legion—the only Order which he chose to wear from among many others in his possession. It is now the highest honour which it is in the power of the President and his ministers to bestow; and its value is enhanced by the fact that every member of the Order is entitled to appear at court ceremonies, and at his death to have military honours paid to his remains. It is eagerly sought after by all Frenchmen, and when obtained, is proudly and ostentatiously worn.

The majority of the members are Chevaliers or Knights; and next above them in rank come the

Officers, the Commanders, then the Grand Officers, and highest of all, the Grand Crosses. Civilians on whom the Order is conferred have to pay certain fees for the privilege; but in the case of soldiers or sailors it carries with it a pension, varying between ten pounds for Knights, and two hundred pounds for Grand Crosses. The Knight's insignia of the famous Order are a red ribbon at the button-hole when in plain clothes, and a silver-mounted enamelled cross when in uniform. The Officer has a red rosette when out of, and a gold-mounted enamelled cross when in, uniform; the rosette being worn also by all the members of the superior grades when in morning-dress. In evening-dress or uniform, the Commanders wear a red collar with a cross pendent; the Officers a star on the left breast in addition to the collar; and the Grand Crosses a larger star, and a broad red ribbon or sash across the breast.

Officers of the army or navy receive the Cross of the Legion of Honour by right after twenty years' good service; but the private soldier or sailor is compelled to win it by distinguished conduct in the field, and often deserves it over and over again before he succeeds in obtaining the much-coveted honour. Civil servants, prefects, procurators, &c. also get the Order after a certain term of service as such; but authors, artists, poets, inventors, engineers, and others have to knock long and loudly at the official door before their claim to the decoration is allowed. None but persons of irreproachable character—that is, those who have never stood as criminals at the bar of a court of justice—are admitted to the companionship of the Legion; and it is therefore looked upon everywhere and by everybody in France as a certificate of or testimonial to honesty and merit.

It is stated that the Commissioners of the Paris Exhibition having been intrusted by the government with the bestowal, upon persons who had rendered services in connection with the great International Show, of three hundred Crosses of the Legion of Honour, no less than twenty-two thousand applications for the honour were received! Certainly, the Order could not be better bestowed than in rewarding those who have fought in the great battle of the Arts and Sciences, and thus done their utmost to promote peace and good-fellowship among the nations. But it is somewhat strange that the great Cross which was the guiding star that led Napoleon's famous troops to so many victories, should have developed into a prize-medal for successful traders or a guerdon for political adventurers. There, certainly, is a decline, which if not stopped, will work its own cure, by rendering the decoration valueless.

At Austerlitz, Napoleon bestowed the Cross from his own breast on a grenadier of the Imperial Guard who had saved the Emperor's life when he was fired at by a Russian sergeant of the line. The veteran dashed out of the ranks—in itself an offence against discipline which on ordinary occasions neither Napoleon nor Wellington would forgive—and with his musket struck up that of the Russian, whose shot was thus diverted from its object, only however, to find another victim in the shape of one of the Emperor's suite. The old grenadier then despatched his enemy, and gallantly and successfully defended himself against a horseman and two other infantrymen who sought

to avenge their comrade. Napoleon was a witness of the faithful Guardsman's act; and riding up to him as the latter rejoined his company, he detached from his own breast the golden Cross which glittered there, and pinned it upon that of the veteran. Shouts of 'Vive l'Empereur!' rang through the air from the ranks of the Old Guard, every member of which accepted the decoration of their comrade as a compliment paid to the regiment itself.

So much for the great French Cross. And now we will briefly recount the story of one which is as dear to the hearts of Englishmen—though in a quieter way—as the Legion of Honour is to our neighbours across the Channel—namely the Victoria Cross. This is a purely military and naval distinction, and is only conferred for gallant conduct in the field or in action at sea. Englishmen as a rule do not care much for Orders and Crosses, and the few which are in the gift of the sovereign as the fountain of all honour—namely the Garter, the Thistle, the Bath, the St Michael and St George, and the Star of India—are generally reserved for persons of high rank in the social or official scale who have rendered great services to the state in various capacities. Perhaps the nearest approach to the Legion of Honour on this side of the Channel is the Order of the Bath, which is conferred upon all classes as a general distinction, and for long and zealous service in the cause of the state or in any particular profession.

The Victoria Cross was founded in the year 1855, the period of the Crimean War, and was instituted as a special military and naval distinction for distinguished conduct in the field. It consists of a plain unpretentious piece of bronze-metal in the shape of a Maltese Cross, and is manufactured from guns which have been taken from the enemy. On the front of it is the figure of a lion above a scroll, which bears the simple and appropriate motto—'For Valour'; and on the reverse are inscribed the name of the recipient and the date of the deed of bravery for which it has been conferred. On the top of the cross is a crown and the initial letter V, through which passes the ribbon by which it is suspended. The Cross is conferred on all ranks alike in the army and navy, and when worn, is distinguished by a red ribbon for the army, and a blue one for the navy. It also carries with it a pension, varying from ten pounds for a private to one hundred pounds for an officer. Apart from this, there is no distinction whatever; and its bestowal on a drummer or private as well as on an officer is duly announced in the Gazette, accompanied by a full recital of the brave deed which has won it, and giving its possessor the right, if he chooses to exercise it, of placing the letters V. C. after his name. In the case of officers, this last-named privilege is taken full advantage of; but the privates or drummers have never, as far as we are aware, attached these honourable initials to their names. Perhaps this is because their superior officers have never encouraged them to do so, and the modest fellows—for the truly brave are ever modest—have never had the moral courage to assert their right in this respect.

The Victoria Cross is very sparingly bestowed, and its value is enhanced by the fact that it can only be obtained by a genuine act of bravery

performed in the presence of others and certified by the hero's commanding officer. The recommendation is then forwarded through the general commanding to the Secretary-at-War, who in his turn submits it to the Queen. Though conferred on officers as well as the rank and file, it is essentially a soldier's distinction; and the majority of the members of this most honourable of all military Orders consists of non-commissioned officers, drummers, and privates. It reflects great honour on the drummers of the British army that so many of their comrades have gained the Victoria Cross; the records of the Crimean, Indian Mutiny, and other later wars containing splendid deeds of bravery and devotion performed by the holders of this once despised rank. This is the more to be admired, as the bugler or drummer has very few chances of distinguishing himself; but when an opportunity does occur he is never remiss. It was a drummer who helped to fasten the powder-bags on the gates of Delhi, the destruction of which resulted in the capture of the mutinous city of the Great Moguls in 1857. The act was performed amid a perfect shower of shot and shell, and was rewarded—some months afterwards—with the Victoria Cross. It was also a drummer who, while acting as field-bugler to Lord Napier of Magdala in the Abyssinian War, left the general's side, and dashed first into the stronghold of the tyrant Theodore.

Perhaps the most daring deed that ever won old England's Legion of Honour was that which was successfully performed by Kavanagh during the Indian Mutiny. Lucknow was besieged, and its garrison was starving. Besides the little band of devoted men, there were also women and children croped up in the Residency, at the mercy of some fifty or sixty thousand savage and relentless foes. Daily, nay hourly, the little garrison was growing weaker and weaker, and nearer and nearer were pressing the dusky sepoys, until it became a matter of life and death to the heroic few that Sir Colin Campbell, who was known to be advancing to their relief, should be at once informed of their real state and their utter inability to hold out much longer. A volunteer was called for, a man who would consent to be disguised as a sepoy, and who would risk his life among the mutineers, in order to make the best of his way to the advancing army. The call was immediately responded to—as it generally is by Britons in the moment of supreme danger—and two or three men expressed their willingness to undertake the task.

From these brave volunteers, an Irishman named Kavanagh was chosen, who, to his other various qualifications, added a knowledge of the enemy's customs and a thorough acquaintance with their language. The Commandant shook the brave man by the hand, and frankly informed him of the dangerous nature of the task he had undertaken; how it was more than probable that he might meet his death in the attempt. But the gallant fellow persisted; and his skin was at once coloured by means of burnt cork and other materials to the necessary hue. He was then dressed in the regular outfit of a sepoy soldier. When night set in, he started on his lonely and perilous mission, amid the hearty 'God-speeds' of the famishing garrison. In his breast he carried despatches for Sir Colin Campbell, with the con-

tents of which he had been made acquainted, in case of their loss.

We have not the space at our command to give all the particulars of his remarkable journey. He succeeded however, after many narrow escapes and great hardships—during which he often had to pass night after night in the detested enemy's camp, and to march shoulder to shoulder with them in the daytime; and when he left them, to swim across rivers, or to crawl through the tangled thickets where the deadly tiger asserts his sway—in reaching Sir Colin Campbell's camp; where, to finish his stirring adventures, he was fired at and nearly shot by the British outposts. Kavanagh's narrative was listened to with rapt attention by Sir Colin, who immediately gave orders for the army to advance as quickly as possible to the aid of the gallant defenders of the Residency. How the latter were rescued is a matter of history. Kavanagh lived long enough to wear his Cross, though he lost his life shortly afterwards in battle with the same enemy; but the noble example he left behind him was not lost on the brave hearts who eventually saved India for England.

In concluding our article, we wish to give expression to the feeling of satisfaction with which we, in common we believe with all Englishmen, have heard that the Queen has bestowed upon certain officers and men England's Cross of Honour; amongst other deserving officers and men, to Lieutenants—now Majors—Chard and Bromhead, of South African fame. Their noble deed—how, with about a hundred men, they covered the retreat of an army, and saved a whole colony from ruin and devastation—is fresh in the public mind, and needs no recapitulation. It will ever live in history as an exploit *unique* in military annals, and will shed a bright light over a period of dread and unparalleled disaster.

Such then is the story of these two famous Crosses; but whole volumes could be filled with the glorious deeds of those whose breasts have borne or are now bearing the honourable insignia. Though somewhat dissimilar in the manner in which they are now conferred, yet both carry out the intentions of their founders by keeping alive within the hearts of the people that spirit of chivalry and honour which is the real strength of a nation.

YOUNG LORD PENRITH.

CHAPTER XXXIX.—COME TO HAUNT ME.

'Push, men, with a will! All together, now. And you, Barker, lock the wheels of that van, to stop its slipping down as fast as we get it up. One more try at it, and the thing is done.' It was Hugh who spoke, and he was just then busily engaged in superintending the removal—technically called shunting—into a siding of a number of empty cattle-vans and horse-boxes with which, in anticipation of Ballbury horse-fair, the wisdom of the goods-manager had encumbered the small station of Hollow Oak. There was very little accommodation there in the shape of sidings unoccupied; and since it was necessary to clear the rails on the 'down' side, this superfluous rolling-

stock was, by Hugh's orders, forced up the steep incline of the only available siding, and the brakes put hard on.

'That's very dangerous, Edmunds,' remarked Hugh, as the empty vans were at length disposed of.

'It is, sir,' replied the shrewd head-porter. 'No siding ought to be so steep; and a trifle would bring the whole lot of wagons down again, just, mayhap, as a train was passing. But we haven't time to think of that now. My lord's going up to London by the 12.17 to-day. Word's been brought from the Hall.'

Hugh reddened, and then looked very stern and cold. 'What will Lord Penrith require?' he said, not in his usual pleasant voice. 'There is sure to be room in the train. I suppose he has only one carriage, so you can get a truck in readiness to convey that one.' And then he walked away, leaving Edmunds, who had been used to see the lord of Alfringham received with almost royal honours, sorely puzzled.

In due course Lord Penrith's carriage came down the road that led to Alfringham, and drew up at the station door amidst much lifting of caps and touching of hats. Within it were the old lord, propped up with cushions; his sister Mrs Stanhope, and his niece.

'Train not in?' said Lord Penrith querulously. 'Then I'll go into the waiting-room. I won't stay here, to be chilled to the marrow. I will go into the waiting-room, while you attend to the carriage.'

The train, technically known as the 12.17 on the 'up' line, was not very punctual that day. The hands of the clock crawled on around the dial-plate. It was 12.30, then 12.40, and still no train. The subordinates at the station looked out impatiently for a distant puff of white smoke, listened eagerly for the sound of a steam-whistle. The train 12.17 was provokingly behind time, and with 'my lord' waiting for it.

'Most shameful misconduct! Where is the station-master?' demanded Lord Penrith. Edmunds replied diplomatically, that the station-master was at that moment busy. He did not comprehend Hugh's conduct in keeping aloof, any more than did the noble master of Alfringham, who, like many another magnate, was accustomed to be treated with deference by all with whom he came in contact. How could Edmunds guess that, as the party from the Hall alighted, Hugh had got one glimpse of Maud's unforgotten beauty, and had then withdrawn beyond reach of recognition? He had his own reasons for not desiring to be presented to Mrs Stanhope and Lord Penrith as the fisherman who had saved Maud's life, at the risk of his own, when the pleasure-boat was lost on Bala Lake.

Presently—it was a good while first—the train that should have been there at 12.17 hove in sight. 'Yes; we're a goodish bit overtime—rails were slippery, and clogged in places with the snow,' said the guard, leaping from his van. 'But now we'll catch up lost time. Won't we, Jem?' Part of which confident speech was addressed to Hugh as station-master, and part to the engine-driver.

'We'll try, anyhow,' said that grimy and resolute person, as he stamped his feet on the footboard to warm them.

'You had better be quick then about that carriage. Surely the express is not far behind you?' said Hugh.

'Never you fear, Commodore,' returned the guard with a grin, as he bustled towards where Lord Penrith's carriage was being wheeled upon a truck; 'I'm too old a railway bird to be caught napping. Express hadn't been telegraphed when we passed Stedham,' he added jubilantly. 'Expect it's the state of the rails.'

Hugh, less confident, glanced towards the signal-box; but no warning sign from the semaphore told of the approach of the express, which passed Hollow Oak without stopping. Meanwhile Lord Penrith, by the exertions of his valet and footman, had been placed securely in a corner of a first-class carriage, amidst pillows, cushions, and all the paraphernalia with which a wealthy invalid sets off on a journey. Maud and her mother had also taken their seats. The doors were closed.

'Go ahead, Jem!' called out the cheery guard, when at that moment Hugh, looking over his shoulder, saw the danger-signal, all too late, hoisted at the entrance of the deep cutting, and saw the swift express, unannounced, come thundering along the rails at a speed that nothing could resist.

There had been negligence somewhere—that was certain; there always is when a railway accident occurs; and it is invariably a task from which Minos would have shrunk to apportion the blame so as to make censure and punishment fall on those who really deserve it. Station-masters and signalmen, telegraph clerks, guards, and drivers, had very likely each and all contributed their quota of blundering or indolence to the misconduct that threatened to end tragically enough. But the danger was so near and so dreadful that the thought of it swallowed up all other thoughts. Others besides Hugh Ashton saw the swift express come rushing through the gorge between the deep banks of the cutting, a torrent of wood and iron on its headlong way. There was a cry of horror, another, and then a loud shout, and an uplifting of arms; and Edmunds, with more presence of mind than the rest, snatched up a red flag, and waved it, to attract the attention of the driver of the coming train.

Alas! it was all too late. This was no case for puny remedies, such as shouts and gesticulation and the waving of flags. A train going at such furious speed as the express cannot be stopped like a horse flung back upon his haunches by the pressure of a powerful bit, in a moment. Those in charge of the express train had taken the alarm; but it was little that they could do. The driver had tried to reverse his engine. The guards were not idle. The spectators on the platform could hear the harsh rasping sound of the brakes, as, with a sort of stony-eyed horror akin to the dread fascination with which some fluttering bird gazes on the cold, gleaming eyes of the rattlesnake, they watched the onward rush of the rapid train.

There was no hope that the tardy train of 12.17, hardly in motion, and gliding with a scarcely perceptible movement along the platform, should avoid a fatal collision with the swift pursuer now so near. No hope save in the courage and the readiness of one man—and that man Hugh

Ashton. The presence of mind which he had shewn many a time in the face of danger, stood him in good stead now. Hardly had he seen the coming peril before the only means of averting it flashed, like a heaven-sent thought, upon his mind. Those wagons and vans in the steep siding—mere lumber an hour ago—now afforded the only available means of averting the catastrophe that was so imminent. Without an instant's hesitation he dashed across the line, undid the brakes of the foremost waggons, and with desperate strength set the whole array of horse-boxes and cattle-vans in motion. Down they came with a rattle and clang that was heard even above the thunder of the advancing express, and with the impetus of the descent added to their own weight, rushed clear across the lines, blocking the railway from bank to bank. It was all that Hugh could do to escape from being crushed beneath their weight as they brushed him by; but the deed was done, and a score of empty wagons and horse-boxes were interposed between the two passenger trains.

Then came the crash! No earthly power could have prevented the express from running into the empty rolling-stock in its path, with a rending and a splintering of iron and wood, and a cloud of dust and fragments, and from tearing its way through the impediment with a force that brought the wreck of the cattle-vans into sharp collision with the ordinary train ahead. But the violence of the first blow had been spent, happily, on horse-boxes and wagons, and the accident was not the terrible one that it had threatened to be. A carriage or two of the 12.17 train were wrecked utterly; all had panels and windows the worse; but of the passengers and railway servants there not a life, thanks to Hugh's boldness and forethought, was lost. There were bruises and contusions in plenty; some bones may have been broken; but such injuries passed almost unheeded in the general joy and thankfulness. Not a life lost! Thank God for that! And forget not the brave man who risked his own to save others!

What a cheer it was that greeted Hugh Ashton when, breathless and bareheaded, he made his way back to the opposite side of the line, where already a crowd, such a crowd as the village could supply, was gathering to lend help to the passengers in the broken train. There were men who asked it as a favour to be allowed to shake his hand. There were mothers who as they clasped their children to their hearts addressed him as the preserver of their own lives and the lives of their dear ones, and prayed God to bless him! But the passengers of the express were not fortunate enough to escape more serious accident, since the force of the collision, checked as it had been by the strenuous efforts of engineer and brakesmen, had still been sufficient to convert the two leading carriages into a shapeless mass of wreck, and two of their occupants were killed, and thrice as many maimed and wounded.

In the midst of this excitement, Edmunds came suddenly up and laid his hand on Hugh's sleeve. 'My lord's hurt, I'm afraid—Lord Penrith, you know, sir,' said the head-porter; and Hugh turned to see the old lord, supported by his servants, who were removing him from the carriage in which he had been seated. Beside him were Mrs Stanhope, who had fainted, but seemed uninjured;

and Maud, who, unhurt, was bending over her mother.

'Is Lord Penrith wounded?' asked Hugh, and at the sound of his voice Miss Stanhope started and looked up. Her eyes and those of the young man met. Maud was very pale; she grew paler still, and it seemed as though she would have fallen, had not Hugh Ashton passed his strong arm around her and held her up. 'My darling!' he exclaimed, reckless, in that moment, of all studied reticence, all worldly barriers that rank and fortune interpose between loving hearts. 'My darling Maud!'

And Maud looked up, a timid wonder in her beautiful eyes mingling with a truthful admiration that enhanced her loveliness. 'I was frightened,' she said, in a low voice. 'I did not know you were here. I always feel so safe when you are near me.'

Simple words these, and such as the terror and agony of the moment might excuse; but Maud for the moment neither resented Hugh's daring speech nor attempted to free herself from the clasp of the arm that supported her.

'Mr Ashton, our station-master, saved your lives, yes, of all of you, Miss, begging pardon for speaking so free,' said Edmunds, still under the influence of the exciting scene.

'Is it *your* praise that I hear on all sides? Must I thank you again for my life, that you saved before? It is so like you!' murmured Maud; and never had music been so sweet in Hugh's ears as the sound of that low voice; but in the next moment Miss Stanhope, blushing, extricated herself from his hold, and said to her mother, now recovered from her faintness, and who was kneeling at the old lord's side: 'I fear he is very ill, my poor uncle—he has not spoken since the shock. A doctor!'

At this instant Lord Penrith, who had seemed insensible, opened his eyes, and moaned feebly, looking first at his sister, and then at Maud, with evident recognition.

'What is it? Ah! I remember. Yes, I am hurt,' muttered the old man; and then his restless eyes met those of Hugh, who was bending over him. Instantly Lord Penrith's pallid face assumed a look of horror and dismay. 'Go, go!' he said, shuddering. 'Why has he come here, to haunt me at the last!' And then his eyes closed, and Mrs Stanhope shrieked, for she thought him dead.

'He is not dead, but severely hurt, I fear,' was Dr Bland's verdict, when, five minutes later, he arrived at the station. 'It will be better to send his lordship up to Alfringham at once, whilst I look after some of the other wounded passengers who are sadly in need of aid. And I should advise that medical assistance—the most eminent—be summoned by telegraph from London. Say, Mr Blades, my old principal, and of course Sir Joseph Double-fee, and any other leading man. No time, in such a case, should be lost.'

As Lord Penrith was placed in his carriage, which fortunately was not much the worse for the shock of the collision, for removal to his stately home, he spoke again, and twice, after he had reached Alfringham and been laid in his bed, surrounded by every care and luxury available to the ailing rich, he repeated, monotonously, the same words: 'Come to haunt me!'

'He must be wandering in his thoughts, from the effects of the blow. Poor Marmaduke!' said Miss Stanhope. And before night, the great London doctors, called down by telegraph, arrived at the bedside of their noble patient. But the medical town mice could but confirm the dictum of their colleague the country mouse.

'Severe internal injury,' said Sir Joseph and Mr Blades, M.R.C.S., but they said it very gravely; and they added that his lordship could not be in more careful hands than those of Dr Bland.

It was long that night ere Maud could compose herself to sleep, so vividly did she recall, with strangely mingled sensations of shame, and what was almost pleasure, Hugh's words and looks, and the pressure of his encircling arm, at Hollow Oak Station. Something had suddenly awakened in her feelings towards Hugh Ashton as yet unsuspected; and she felt, with a sort of half-terror, that all unconsciously to herself, her heart, from the very first must have been drawn, as by a resistless force, towards Hugh.

AMERICAN FOOD-SUPPLIES.

ONE of the conspicuous phenomena of the age is the inability of the British Islands to supply sufficient food for the teeming population, and the corresponding necessity for procuring supplies from abroad. The principles of free-trade have beneficently permitted all the needful importations. The world at large pours its superfluity into the United Kingdom. Food of every kind is cheap and abundant. There seems no end to the good that is done to buyers as well as to sellers. In the great competition for securing the trade of supply, a first place has been gained by the United States, which is only what might be expected from the boundless expanse of that country and the enterprise of its inhabitants.

At one period in its history our chief importation of food-material from the United States to this country was flour; at all events, flour was one of our earliest importations, as we read of large quantities of it being brought to England at the close of last century for the relief of people suffering from famine; and generally, throughout the 'dear years,' American bread-stuffs came into notice. It was not, however, till after the Atlantic had become a highway for the powerful steam-boats which now traverse it, that our grain-trade with America assumed its present dimensions; and now the Americans, while making flour for themselves and for all the world besides, have set up upwards of twenty-five thousand flour-mills, capable of turning out at present over fifty million barrels per annum.

In Ohio the annual wheat-crop averages twenty-two million bushels per annum. Last year the crop reached thirty million bushels, while in Texas four hundred and fifty thousand acres of land are devoted to the growth of wheat. Farming in America, and especially in California, has of late assumed proportions, and is carried on in a way totally different from anything known in Great Britain. Our old-world

farmers still do in most things as their fathers did before them; growing in particular a variety of crops on their farms, and doing by the aid of hired servants all the necessary work; ploughing, seeding, and reaping; stacking and thrashing their wheat; milking their cows and making their butter; sending what they prepare, as soon as it is prepared, to market. But in our farm across the Atlantic, business is managed in a different way. A speculative American farmer of the modern school considers it unnecessary to divide his allotment into fields on which to grow different kinds of grain. He puts all his eggs, so to speak, in one basket, and makes a big venture for the favours of Fortune by growing only one article, such as cattle, wheat, or Indian corn. In saying this, we are not of course including thousands of struggling agriculturists of the old school whose farms are dotted over the vast American continent; we are alluding to the new order of things promoted by the new men who have arisen; to the 'Corn Kings of California' and the 'Cattle Kings of Indiana,' men whose oxen are numbered by tens of thousands, and whose fields of wheat are measured in miles; likewise to the great dairy-farmers who turn out their makes of butter and cheese by tons.

An English or Scottish farmer would be astonished could he see a stretch of wheat extending for miles in length: a field in which a good day's work is for a team of oxen to make one furrow, and where ploughing on a gigantic system must be had recourse to. Such extensive fields are only to be found on our 'Farm across the Atlantic.' Stay-at-home farmers will be still more astonished perhaps to know, that in most instances the person speculating takes no trouble whatever about the preparation of his ground or about the sowing or reaping of the crop; nor does he interfere in any way whatever. He simply puts himself forward as a speculator in the matter, and is prepared to stand the 'hazard of the die.' His crop may be blighted, or it may bring him a fortune; but whatever may happen, the farming of the land gives him no personal trouble. He keeps no army of ploughmen, no stud of work-horses. He simply contracts with people who make it their business to provide the requisite labour for cultivation, and devote to it their own personal supervision; such persons are amply provided with the appropriate machinery, and the necessary army of labourers; they find the seed and sow it; they reap the harvest and thrash out the grain; they winnow the corn, pack it in sacks, and transport it to the place whence it is to be transported to the market at home or abroad.

Hundreds of thousands of bushels of wheat or other grain are thus dealt with every year. A field of one thousand acres we shall say, will yield twenty thousand bushels; twenty bushels an acre being no uncommon yield in the wheat-fields of America. Thirty, forty, and even fifty bushels have been obtained with deep ploughing and a little

care in the manipulation of the seed. At a profit of one shilling per bushel, the wheat-field specified should yield a return of one thousand pounds sterling. In the state of Oregon splendid crops of fine wheat are annually obtained. Scratch the ground, drop in the seed, and lo! a crop will arise of from twelve to eighteen bushels per acre! Moreover, crop after crop may be taken from the same field, and yet after the expiry of four or five years, with a little rest and careful weeding, the land will still be responsive.

On the great speculative tracts of wheat grown in California and Oregon, the grain is not made up into sheaves, and as with us carted to the barn-yard and laboriously built into stacks, just to be again taken down; but is thrashed out on the field almost as it is reaped, placed in sacks, and then shipped for Liverpool and other English or Scottish ports, whence it is distributed over the length and breadth of Great Britain; and so our farm across the Atlantic is made to yield a large proportion of our daily bread. As an instance of what can be done in the United States, it may be mentioned that in the course of a recent harvest, while a wheat-field was being cut down, a portion of the grain was cut, thrashed, made into flour, baked into bread, and fired, in the course of a very few minutes; biscuits out of the same crop being distributed to the harvesters as they were at work!

The largest grain-farm in the United States is in all probability that of the Brothers Grandin, on the Red River of the North in Minnesota. It embraces over thirty-eight thousand acres, most of which is good wheat-land. One hundred horses and mules are already in use for cultivation, as well as seventy-five ploughs, fifty-five harrows, twenty-four self-reapers, and seven steam-thrashers. Elevators for loading the grain have been erected by the side of the river; and up to the present time fully seven thousand acres of land have been broken upon for cultivation. The same firm have a stock-farm of twenty-seven hundred acres. The wheat that is grown and the beef that is fed on this great farm all come to Europe. In the United States during the year 1878, it may be mentioned, that for the use of the American people and for the population of other countries, there were grown and harvested three hundred and sixty million bushels of wheat, and four hundred and five million bushels of oats, whilst of Indian corn there were grown in all one thousand three hundred and forty million bushels. Of the latter grain, countless acres are also sown for the feed of cattle and swine. In those seasons in which it is impossible for this cereal to be grown and reaped at a profit, it is sometimes converted into fuel, which burns excellently!

The way the American farmers look at the question of Indian corn is an eminently practical way; they say: 'We are far from a market; and to plant, reap, and thrash out corn, then carry it a long distance to market, would scarcely pay us, as the grain would not bring more than about twenty-eight cents per bushel. But by converting the corn into beef, in other words by feeding cattle with it, it brings us from forty to fifty cents; and the cattle are bought and taken away as they stand.' And

that is a thoroughly sensible way of putting the case.

It was in the United States that the production of cheese in factories was begun; and some of the dairies, or rather butter and cheese manufactories, are on a large scale. Enormous quantities of these excellent comestibles are made on our farm across the Atlantic and sent to us for consumption. The extent of the trade will be apparent when it is known that for freight alone, the butter and cheese exported cost as much as two hundred thousand pounds. American cheese is yearly becoming of greater importance to the British commissariat; and several English landlords have warned their tenants that, unless they speedily develop a new style of manufacture and produce a better article, they will be beaten by American enterprise and ingenuity. Indeed they are already beaten; the cheese of last season in many a farm of the dairy districts of Scotland is so unsaleable that arrangements are seriously contemplated for sending the milk to Edinburgh, Glasgow, and other large towns, instead of making it into cheese as formerly. Throughout the United States cow-keeping is carried on both on a small and a large scale. In Californian dairies, butter is the chief product; but in districts where there is no market at hand, cheese only is made. In Californian dairies, great attention is paid to the feeding and general keep of the cattle; and by the most unremitting care large milkings are obtained; while the butter supplies are in keeping with the produce. Some dairymen, many of whom are Swiss, keep from three to four hundred cows; but plenty of dairies exist with a smaller herd. Many of the dairies in America belong to Scotchmen; there is for instance George Campbell's Dairy. George, we are told, keeps one hundred and ten head of grade short-horn cows, which average during the season two hundred pounds of butter per cow; some of the animals yielding as much as fifty-five pounds of milk per day. In 1876, Mr Campbell milked seventy-four cows on pasture, raised twenty-one calves, and turned out six thousand four hundred and forty pounds of cheese, and eleven thousand four hundred and forty-eight pounds of butter.

Californian dairies, however, are on a small scale compared with the cheese manufactories in other states of the Union; they yield, so to speak, but a drop in the bucket compared to the 'oceans of milk' which are operated upon in the eastern portion of the state of New York, where the milkings of many farms are put together on the co-operative system, or where the owners of a cheese factory contract to buy the milk of many farmers at a fixed sum per gallon all the year round, for conversion into cheese, to be sent chiefly to the markets of Great Britain. Utica is the heart of the great cheese district of New York state. There is at that place a cheese exchange, where a large amount of business is transacted; from ten to sixteen thousand boxes will be sold at a meeting, ninety per cent. of the whole being destined for the English markets; and special trains are necessary at certain seasons for its transport to the place of shipment. At the sales there is very little sampling, thousands of boxes changing hands on the reputation of a factory. A few samples are sometimes shewn; but it may be safely asserted that two-thirds of the cheese business is accomplished on the reputation acquired

by makers. A cheese factory of moderate dimensions will take in the milk of two thousand cows per diem; the milk of each patron of the establishment is weighed and credited to him as it is received, the weighing vessel being of a capacity to hold five hundred pounds of milk. The cows which are most valued are Holsteins and Ayrshires; the former will yield from eight to ten thousand pounds of milk in a season. There are over thirteen million cows in the United States, which is six times more than there are in Great Britain, and which is calculated at the rate of a cow to every five persons!

It is known that there are over three thousand factories for the making of cheese throughout America, and that one thousand five hundred million pounds are made annually, as also three hundred and fifty million pounds of butter; the combined value of the two products being three hundred and fifty million dollars. The cheese is manufactured on a uniform plan, each factory having its own formula and its own particular 'wrinkles.' Much machinery is used in the manufacture; indeed the uses of machinery of all kinds, as well as the benefits which result from a division of labour, are largely recognised throughout the United States.

The growth of the trade in 'dead-meat' between America and Great Britain has been rapid. It is yet barely three years old; but there is every probability of over a hundred million pounds-weight of excellent beef and mutton reaching us during the current twelve months from the United States, in addition to an increased importation of live sheep and oxen. There are few who are able to realise how enormous is the stock of beef-cattle in America. The territories of the wild-horse and the bison are now chiefly occupied by oxen, whose destination is the Mersey or the Clyde; and in the end their destiny will be to afford wholesome food to the people who inhabit the British Islands. It has been computed that there are now being fed in the United States more than twenty millions of cattle, thirty-four millions of sheep, thirty-two millions of swine, together with thirteen millions of milch-cows; while for use in the cultivation of the land and for the purpose of carting and carrying, there are twelve millions of horses and mules.

Another contribution made by American producers to the British commissariat is in the form of enormous quantities of corned or preserved beef packed in tins, without any bone. Other preserved meats than corned beef also reach this country in quantity; in the space of two months as many as eighteen thousand cases of such food have been known to enter the Clyde, in addition to the enormous quantities arriving in the Thames and the Mersey. As each case may on the average be taken to weigh seventy pounds, the reader will be able to form his own idea of the important part which is played in strengthening our commissariat by these wholesale importations of cooked food of a palatable and wholesome kind. Some of the American 'packeries,' as they are called, kill and dress in the season over a thousand cattle per day for the purpose of cooking, canning, and exporting to Europe the meat alluded to. For a period of four months the preparation of these tinned meats goes on at Chicago with great industry, hundreds of persons

being employed in the business at remunerative wages.—Many other food-products reach us from America to which we need not at present refer, enough having, we think, been said to shew how valuable to all parties is this important traffic.

TWICE BETROTHED.

IN FOUR PARTS.—PART I.

'You had better forget me, dear—better learn to forget—and I, too, must school myself to do the same. Indeed, indeed, Leonard, it must be so.' And the girl's lip trembled as she faltered out the words; and she bent her eyes upon the ground, that her face might not be seen as she spoke them.

'It is a lesson I shall be very slow to learn,' answered the young man bitterly. 'Women, it seems, are apter pupils, and can throw over those they love, or who at anyrate love them, as lightly as they discard a soiled ribbon or a faded flower. I know well enough that I have little beyond an honest man's affection to offer. The luxuries which wealth can buy'—

'That is not kind,' interrupted Annie, looking up and confronting him with eyes that flashed through their tears, while the colour rose quickly to her pale cheek; 'and what is worse, Leonard, it is unjust. Have you known so little of me that you judge me as one to prefer a life of ease, of splendour if you will, to—to— Ah, Mr Merton—Cousin Leonard, as I called you in happier days, when we were content to pick hazel-nuts and gather violets side by side as boy and girl, without realising how cold and hard might be the future that awaited us—cannot you be merciful to Annie Irwine when she has to choose one out of two paths that lie before her, as before most of us, and chooses that of duty!'—

'Then you mean to give me up?—I am but a briefless barrister, and no great loss,' replied the young man, in a voice that was a little softened by the appeal which the girl had made—'to give me up, and to marry Sir Albert Atwood!'

'As to giving you up, cousin,' said Annie quietly, 'you know well that I break no troth, am false to no vows in telling you, as I do, that I cannot be your wife. You like me, I am sure, and'—

'For like, say love, Annie!' interrupted Leonard in his turn. 'But do not let us quarrel. I shall leave this place, and go back to London, and my chambers and my law-books, and try to be resigned to my great loss. Never mind me! When are you to be married to this man!'

'If you mean Sir Albert, Leonard,' returned Annie simply, 'I do not know that I am going to be married to him at all. But, if he were to ask me, I could not, for my parents' sake, for poor papa's sake above all, say "No."'

Leonard Merton frowned and kept silence for a moment. His love for Annie was sincere; and she was worth loving, as pretty and good a girl as any in the broad marches of Wales; and he had known her since, as a schoolboy in a jacket, he had come down to spend the holidays with his old bachelor uncle at Tremadoc. But even in his pain and disappointment, he could not but own to himself that Annie was justified in her rejection of his suit. The old vicar, Miss Irwine's father, a gentle, scholarly recluse, had been com-

pelled by feeble health and failing eyesight to resign his preferment, and he and his were now very poor.

There were those who said that Mr Irwine ought to have held to his living, which was a good one, at least for a Welsh border parish, and to have got influence brought to bear upon the bishop to make things comfortable. But the meek scholar had strict and straightforward ideas of duty that forbade this; and accordingly the family had left the pretty parsonage, with its spreading mulberries and mellow peach-walls, and were living in lodgings in the village, on some meagre little private income scarcely enough to keep the wolf from the door. And people said that the rich young baronet's evident admiration for Annie would prove a godsend to the late occupants of Tremadoc Vicarage.

Sir Albert was a rich man; had been born—so the gossips averred—with a gold spoon, not a silver one, in his mouth; but, if he had, his father had been at the pains of fashioning it from the crude ore. The first baronet and founder of the fortune, Sir George, had been a bluff, hard-headed north-countryman, prone to boast over his sumptuous dinner-table how he had forged iron and puddled iron, and been foreman, overseer, ganger, and sub-contractor, before he rose to opulence; a result which his shrewd and persevering boldness well deserved.

George Atwood had married late in life. His two daughters were well dowered; but the bulk of his property, shares and stock, land and mines, went with the title to his only son, who dwelt at Tremadoc Place, a Tudor mansion purchased by his father, and of which, as report declared, it would be Annie's fault if she were not the mistress.

'I never envied Atwood till now,' said Leonard Merton at the conclusion of the interview—'never envied him; I mean his wealth and his grandeur, and the fact that he was born to find the world at his feet. But I do envy him now. I shall go, but not until after Thursday. The tunnel is to be opened—or inaugurated, as penny-a-liners phrase it—and it would never do for the standing counsel of the Company to be absent from the ceremony.'

The tunnel of which Leonard spoke was one which had been recently constructed, at great expense, beneath the wide estuary of the river, half-English, half-Welsh, which ran past Tremadoc to the sea. A new Company, of which Sir Albert was chairman, had laid out the short railway line and dug the docks that were to facilitate the transport of pig-iron, blooms, and bars from the Atwood iron-works to markets best reached by sea; and the opening of the tunnel for traffic was to be the occasion for festivities, addresses, and rejoicing. The directors, the secretary, the engineers, and legal advisers of the Company would all be there. Leonard, as one of the latter, could not well be a defaulter without giving rise to ill-natured remarks.

Leonard Merton was not quite accurate in describing himself as a briefless barrister; but it is certain that the most profitable portion of the little forensic work he had to do was that which fell to his lot as one of the standing counsel for the Tremadoc and Gwyllt Bay Company. It was Sir Albert's careless good-nature which had put that

annual hundred in the way of the struggling neophyte, and now, for that very reason, Leonard felt that he must resign it. He could not be under obligation to Annie's husband that was to be, to the rich man who had robbed him—so in the soreness of his heart he declared—of his one ewe-lamb.

The tunnel that was, as the leader-writer of the *County Gazette* affirmed, practically to abolish the impediment presented by the river Arva, with its shifting channel and treacherous sands, was opened with due solemnity and much cheering. There were present officials and magnates of finance, local dignitaries, and a host of guests. The cavernous depths of the excavation were brilliantly lighted; a train was brought in, and duly puffed and snorted its defiance of conquered Arva rolling impotently overhead, and there were speeches from the Lord-lieutenant of the shire, and from the mayors of the towns adjacent, and from the glib Secretary of the Company, and the design and the execution of the new work were glorified exceedingly.

And then came lunch—for nothing in Britain can be done without the national adjuncts of eating and drinking—and long tables were laid, as if by the deft hands of obedient gnomes, and there were clattering of knives and forks, rattling of plates, and popping of champagne corks, in that naturally gaunt and gloomy place, above which ran the river. The latter circumstance—adding, as it did, a spice of novelty and of excitement to the subterranean merry-making—served to heighten the spirits of the company to a pitch of buoyant hilarity, and there were toasts and speeches, of the usual frothy type of festive oratory, as the wine flowed freely.

Probably the saddest heart of any present was that of Leonard Merton; but the young barrister knew too well what our imperious code of good-breeding exacts, to play ostensibly the part of a kill-joy at the feast. But the effort to take his share in the conversation was a painful one, and still more painful was it to watch Annie from afar, seated beside her mother, and to mark the assiduity of Sir Albert Atwood's attentions. Sir Albert, whose praises each speaker had enunciated with the emphasis due to the general entertainer, was indeed in some sort the hero of the hour. The coal and iron of those great mines and foundries which the new railway was to connect with the sea, were his. He was chairman of the Company, presumed originator of the daring project of the sub-riverain tunnel, and founder of the feast.

In personal appearance young Sir Albert was well enough, a plump, florid young man, with blond whiskers, rattling watch-chain, and a voice that was perhaps a little too loud and self-confident. He had neither the inches nor the handsome face of Leonard Merton; but he was a favourite with most ladies, and with many men. Slightly boastful in discourse and sanguine in disposition he was; but then his road through life had been made so easy for him, that some faults of manner might be pardoned in one who had inherited so many annual thousands and so much power.

Liberal and free-handed, on a gala occasion like the present, Sir Albert certainly was. It was from his private purse, not from the corporate

purse of the Tremadoc and Gwylt Bay Company, that the cost of the sumptuous luncheon would be defrayed, nor had he forgotten the many workmen directly and indirectly employed in the lately completed undertaking, whose shouts, over their beef and strong ale, might be heard at intervals from a distant part of the tunnel. And in seeking to change Miss Irwine into Lady Atwood, Sir Albert gave proof that he could be disinterested in his matrimonial views.

Annie, sitting beside Mrs Irwine, looked very pretty, but somewhat grave and sad; so other girls, who marvelled at her good luck in drawing so handsome a prize from the marriage lottery, averred. She never once looked at Leonard; nor did Sir Albert succeed in evoking more than a very faint smile from her in response to all his attempts to amuse. But when the luncheon came to an end, and the waiters began to huddle away the paraphernalia of the banquet, and gay groups walked to and fro chatting and laughing, Miss Irwine allowed her wealthy admirer to give her his arm and lead her a little apart from the crowd.

'It is not the first time,' said Sir Albert, in a voice which, for him, was less steady than its owner could have desired, 'that I have said to you, Miss Irwine, how much I love you, and how I should be happy indeed if you would let me teach you to care a little for me. Let me speak again and ask you Annie, to be my wife.'

Annie trembled and grew pale. She knew that Sir Albert would put the question, and knew too what must be her reply to it, but made a hesitating answer: 'This seems so strange a place—and time—to speak on such a subject.'

'I don't see that at all,' cheerily rejoined the baronet. 'A tale of true love has been told, I daresay, in odder places than a tunnel; and besides, I feel a little vain of having hit out the first idea of this same underground line, which Bounce and Braggett, the contractors, have carried out so well. People call me a lucky fellow, and certainly the world has smiled on me hitherto; but money and success and station are not so much to me, dearest, as would be the pleasure of calling you my wife. Say "Yes" to my suit, and make me the happiest of the happy!'

'Your proposal, Sir Albert, does me very great honour, and I—have—no choice but to accept it, if, after hearing what I have to say to you, you think fit to renew it.—Nay,' she said more earnestly, as the baronet attempted to interrupt her, 'I must be heard. It is but honourable, but fair to myself as well as to you, that there should be no concealment at the outset.' And then gravely, but with an innocent frankness that would not be checked, Annie Irwine told her wealthy suitor all.

For her parents' sake, and most of all for that of the gentle blind father whose income had stopped with the stoppage of his clerical duty, it behoved Miss Irwine, if she married, to marry one who had the means and the will to soothe the declining years of those who were dear to her. Sir Albert, she knew, would promise her that the old clergyman and his wife should have the wind of adversity tempered to them, and that she, the daughter, should never be wholly separated from mother and father. But then she could not give Sir Albert, much as she liked and esteemed him,

her whole heart. She meant to do her duty by him. She would strive to be a good wife. But—but—she avowed, sobbing, there was—there had been, another.

Sir Albert bore the annoyance of this tolerably well for a man somewhat spoiled by Fortune. He knew that though she did not name him whom she preferred, Leonard Merton was the lover whom Annie was forced to discard; but he did not mention Leonard's name, or owe Leonard a grudge, as baser natures might have done. And Annie could not but appreciate his kindness as he assured her, in words that were at once tender and respectful, how well he wished towards Mr and Mrs Irwine, and how gladly he would concur in their daughter's plans for their happiness. For him, it should be his task to make his wife love him. It should not be his fault if he failed. Would Annie marry him?

'Yes!'—the little word, that from a woman's lips means so much, was uttered; but almost at the same instant there came a strange confused noise and a crash as of falling masonry, and a loud cry of alarm from many voices.

'Don't be frightened, Annie,' exclaimed the baronet, changing colour; 'though something seems to have happened yonder!'

PART II.

Something had indeed happened. The baronet's words, even as he uttered them, were being fulfilled to the letter. Those eminent engineers, Bounce and Braggett, were prevented by the multiplicity of their professional engagements from being personally present at the auspicious opening of the tunnel which they had designed and built. But their healths had been drunk, with eloquent encomiums, and one speaker, in a burst of champagne inspired rhetoric, had gone so far as to liken them to the geni who reared the fairy palace at Aladdin's bidding. And now brickwork was toppling down, with ominous rattle, upon the floor, damp already with the water that began to drip and trickle from a hundred crevices.

'The river is breaking through! We shall be drowned!' cried many voices at once; and there were shrill feminine shrieks and angry exclamations, and a rush towards one end of the tunnel, followed by a halt and a rush in the opposite direction. Human beings, in a condition of undisciplined panic, are very like so many sheep, and equally prone to congregate in gregarious helplessness. Several of the gas jets had by this time been extinguished, and the partial darkness added to the horrors of the situation.

The position was no pleasant one. Bricks, some singly, some in masses, were crashing down fast from the roof and sides of the tunnel; and if no one had as yet been hurt, there seemed no reason for anticipating a continuance of this impunity. A deep, sullen sound, like the wash and gurgle of water, grew threateningly loud, and the floor, lately dry, was covered with water already deep enough to wet the dainty little boots of the lady guests, and rapidly gaining on those immured in the tunnel, and reluctant to make a decided move towards either extremity, for fear of running into the very danger they sought to avoid.

'It's full-tide, over our heads, in the Arva. An iron-clad could find water deep enough to float her now,' said some one disconsolately. That very fact that the estuary would be filled from shore to shore with the strong flood-tide setting in from the sea, had lent a zest to the meal so pleasantly enjoyed in those gas-lit recesses. But it was less agreeable to be reminded now of the circumstance that Neptune, in all the pomp and power of his marine array, was close at hand.

'The workmen are drunk! They hardly understood me; and those who caught a glimmer of my meaning, stared at me stupidly, like a mob of frightened cattle,' groaned out the surveyor in charge, a subordinate of Messrs Bounce and Braggett, as he rushed back from an attempt to summon aid. 'That Mr Merton, who knows them, and can speak their language, is trying what he can do with the Welshmen, who are the soberest of the lot; but our regular navvies' brains are drowned in ale.'

Sure enough, Leonard Merton came hurrying along the gallery at the head of some score of hardy mountaineers, whose superior temperance or tougher endurance had kept them sober. 'Quick, quick!' cried Leonard in Welsh, and pointing first to a pile of ladders, boards, and scaffold props which the fortunate carelessness of Messrs Bounce and Braggett's underlings had left piled up in a recess, and then to a ghastly fissure through which the water was gushing—'quick, lads, or Arva will be upon us!'

Those have an imperfect idea of what labour means who have never seen how fiercely men can work when life and death hang on the issue. So it was in this case. In a time incredibly short, but which yet seemed long to those who watched the process, ladders were reared, an apology for a scaffold was put up, and with boards and struts and scraps of miscellaneous timber the damage was repaired. Then there was a cry that the water was breaking in elsewhere like a millstream, and off darted the breathless band of rescuers to fight in a new place the common foe.

Leonard, as he urged on the rest, found time to say that he had sent a messenger to summon the train which had, for show purposes, been brought into the tunnel, and which might, if at such short notice steam could be got up, do yeoman's service in extricating the company from the awkward predicament in which they found themselves. To endeavour to reach either end of the tunnel on foot would be, for the ladies, rash, so much brickwork was falling, and so much water pouring through. He said this, and ran on.

Already the ripple and gurgle of the water, now ankle-deep as it washed the flooded floor, sounded anything but invitingly to the ear, while the crash of the tumbling bricks awoke the sullen echoes of the tunnel far and near. Yet Leonard and his gallant band were not left to toil alone, for several of the more able-bodied of the male guests volunteered their hearty aid; and one by one, and two by two, the sturdy men of pick and shovel came staggering and blinking to 'bear a hand,' as they phrased it, as their beer-benumbed faculties were gradually aroused by the imminence of the peril. The ladies, in their terror, clung to the arms of their protectors; and Sir Albert, who had both Annie and Mrs Irwine under his charge, was unable to render any help in the good work on hand.

The water deepened but slowly, escaping, as it doubtless did, at one of the extremities of the tunnel, and it was not for several minutes after the first breaking in of the intrusive flood that it rose to the knees of those imprisoned there. The brackish stream ran so swiftly as to render it difficult for the weaker to keep their feet, and was evidently gaining depth, as new threads of water came trickling through the roof and fell splashing on the flooded floor.

'We shall be drowned—drowned like rats in a hole! Let us make a push at anyrate for daylight and safety!' cried a voice.

'No, no!' was the answer of those on the outskirts of the throng. 'Here comes the train!'

It was true; the lamps of the engine, like the red eyes of a friendly dragon, gleamed through the depths of the tunnel, and the shrill scream of the steam-whistle, more welcome at such a moment than sweetest music could have been, made itself heard.

'Look alive, gentlemen all!' bawled out, in warning accents, the rough engine-driver, as the iron wheels splashed and churned amidst the water. 'I'll not be able, soon, to keep the fire alight.'

There was a rush for safety. This was no time for standing on order or precedence. Delicate ladies were thankful to find themselves huddled into cattle-vans or ballast-trucks. Boozey navvies, with bloodshot eyes and stammering tongues, found themselves lolling on the cushions of first-class carriages. But, with some cramming and squeezing, there was room for all; and now a shout arose: 'Come back, there! Merton, all of you, come back! We only wait for you!'

'Make haste and clear the tunnel!' called out Leonard, panting, from his perch on a ladder reared against the dripping wall. 'We must keep back the water here, or you'd have it up to the very boiler. Sound the whistle when you see daylight beyond, and leave us to shift for ourselves!'

The train was in motion before the words were finished, and again the weighty wheels revolving lashed the turbid water into yellow foam. Slowly and painfully the engine dragged its load, while fast the water deepened.

'Now, men!' cried Merton; 'to it again, and with a will!'

There was no need to indicate the point where the peril presented itself. Every eye was fixed upon a ghastly chasm through which the brine poured in a rill that ever gained in volume. Furiously, desperately, the handful of gallant fellows—now reinforced by volunteers until they were seven-and-thirty strong—toiled to keep back the spouting water. Should it rise high enough to reach the boiler and cylinder of the engine, all would be lost, and the tunnel a mere charnel-house. At any cost, the danger must be staved off.

Men's wits, as well as their hands, are apt to be quickened under the stimulus of peril, and many a feat of rough and ready engineering was on that day performed, as with brick and timber, with cordage, tarpaulins, and all materials that could be pressed into the service, the workmen fought to keep out the foe. At last—welcome signal!—there came to their ears the shrill, piercing note of the steam-whistle, and they knew that the train, with

its living freight, had reached daylight and free air, and that the gallant forlorn-hope might at last consult its own hitherto suppressed instinct of self-preservation.

'Steady, now, lads; see that none are left behind!' called out Leonard, and he was the last to swing himself down from the improvised scaffold, and to join the retreating party. Fast as they ran, the roar of the cascade within pursued them faster still, like the voice of some monster loath to be balked of its prey; and though the water, before they cleared the tunnel, was more than waist deep, they cleared it, and, without the loss of a life, emerged into the fresh free air, and scrambling on, reached at length the place where, at an angle of the line, the train had come to a halt.

'Safe? All safe? Tell us, for God's sake!' cried out fifty voices, male and female, of those who were stretching their heads out of the windows of the carriages to greet the brave men who now came panting up.

'All safe! It was a near thing, though,' cheerily answered the representative of Messrs Bounce and Braggett, who had laboured among the best, to avert the ruin which the 'scamped' work of his employers had brought about. But he who had the best right to be spokesman—Leonard Merton—had already separated himself from the rest, and avoiding the thanks and praises of those whom he had saved, had struck into a field-path that led towards his solitary home. Annie Irwine went back to her home as the affianced bride of Sir Albert Atwood. Very grave, thoughtful, and sad, was the face of Sir Albert himself. He had lost money doubtless by the late disaster, but that he could bear with philosophy. Yet, for an engaged and accepted suitor, his mien, as he returned to Plas Madoc, was strangely moody and depressed.

THE BONINS ISLANDS.

ABOUT five hundred miles south of Yokohama, the capital of Japan, there lie three groups of islands, known as the Bonins, and which as regards soil, climate, and general beauty can scarcely be matched anywhere. Let us see what Mr Consul Robertson of Yokohama, who visited the Bonins in 1875, has to say about these charming islands and their history.

The northern group are known as Parry, and the southernmost as Bailey or Coffin. The central group, nine and a quarter miles in length, consists of Stapleton, Buckland, and Peel Islands, the last of these being nearly five miles long. Hillsborough Island, the largest of the Bailey group, is seven and a half miles long by one and a quarter broad. There would appear to be little reason to doubt that the Japanese were the earliest discoverers of these islands; but it is to Captain Beechey, who visited them in H.M.S. *Blossom* in the year 1827, that we are indebted for the first trustworthy reports. The *Blossom*, despatched from England for the purpose of co-operating with Franklin's and Parry's Arctic expeditions, having failed to meet the explorers at the rendezvous in Behring's Straits, proceeded with her commander Captain Beechey to the Pacific,

and in the course of her cruise visited the Bonins in June 1827. Here the captain remained, in the harbour of Port Lloyd, for several days, taking possession of the group on behalf of Great Britain—a fact established by nailing to a tree a sheet of copper punctured with a declaration to this effect—and giving the various islands their present nomenclature. The copper, in a fair state of preservation, is now in Mr Robertson's possession.

Although at the period of the *Blossom's* visit the population was limited to two shipwrecked sailors, it was soon destined to receive reinforcements. In 1830, a party of mixed nationality, and comprising some Sandwich islanders, arrived at Port Lloyd from Honolulu and hoisted the British flag. They were provided with live-stock and seeds, and would seem to have thriven in their settlement, so much so that, in 1842, hogs and goats abounded, and a fair amount of land was found under cultivation. The colonists gained a few accessions during the eleven following years, until, on the arrival of Commodore Perry's expedition, which visited the islands in June 1853, they numbered thirty-one members, nine being of European or American nationality, the remainder natives of the Pacific islands, and children. Commodore Perry devotes some space in his published work to an account of the group, and even submitted to his government a scheme for their more perfect colonisation, deeming the islands useful from their position as a coasting station for the contemplated mail-line from San Francisco to China. Urging upon the settlers the desirability of living under some organised government, he drew up a simple code for their guidance. Its rules, however, were never enforced, and are already forgotten. Some live-stock were left on the islands by Perry, who also subsequently forwarded from America a present of useful seeds and implements of husbandry for the use of the colonists. Some visits of men-of-war and whalers occurred during the following years; and in 1861 an effort was made by Japan to colonise Peel Island, when a special Commissioner and about one hundred colonists arrived from Yedo. The Japanese soon wearied of their colonisation scheme, and withdrew in batches; and in 1863 the Commissioner himself followed, leaving, however, a stone inscribed with a declaration that the islands were discovered by Japan, that they were revisited in 1861, and that they still continue the property of that empire.

Mr Robertson's visit was made in H.M.S. *Curlew* in November 1875, when also the Japanese government lighthouse tender *Meiji Maru* called at the islands. He describes the character of the land as hilly, marked here and there with bold crags. The hills are clothed with luxuriant vegetation, comprising cabbage-palms and tree-ferns; and the valleys, which are girt round with fringes of trees, appear to be rich and prolific. That the islands are of volcanic origin is more than probable—Commodore Perry indeed expresses an opinion

that Port Lloyd was at one time the centre of an active volcano—and hence no doubt the richness and fertility of the soil. A solitary hut at the head of the harbour, from which the American flag was displayed, and a few canoes drawn up on the beach or sailing along the shore, furnished the only evidence of colonisation visible by the new arrivals as their vessel anchored. They shortly learned, however, that the community then numbered sixty-nine souls—thirty-seven males and thirty-two females—twenty of the whole number being children. Five only of its present inhabitants may be described as white. They hail respectively from England, France, Germany, Holland, and the Azores, and appear to have arrived at the islands for the most part in whaling-vessels during the last thirty years. The dark-skinned population is composed of natives of the Sandwich Islands, Agrigan, the Caroline and Kingsmill groups, and comprise a Bermudian, a Malay, and two Japanese women. Thirty-five of the number were born on the islands, and exhibit the usual curious effects of mixed alliance.

The holdings of the settlers are dotted over the shores of the Harbour, or lie in some of the sheltered nooks which indent the coast of the island. Here, in the cultivated patches which surround their cottages, may be seen the sweet-potato, *taro*, pumpkins and other garden vegetables growing luxuriantly. On the sloping hill-sides, plantations of sugar-cane, maize, and coconut appear to succeed, and but for the occasional hurricanes, would thrive abundantly. Plantain and lemon groves are numerous, and there is no lack of running streams. The visitors found the settlers provided with an abundance of tame pigs, geese, ducks, and fowls; and in the season—the months of April, May, and June—enormous numbers of turtle are secured without much labour, one man capturing as many as fifty during the day.

The dwelling-houses are rudely constructed. The side-posts and rafters are of hardwood, and being covered with the leaves of the cabbage-palm, afford weather-tight shelter. The floors are boarded, and the house divided into a dwelling and a sleeping room, the kitchen being in a building apart. The furniture of the cottages is sparse and simple; a rough deal table, chairs, a bed, a shelf bearing the family earthenware, a clock, and some cheap gaily coloured prints, which line the walls, being its leading features. Everything being kept scrupulously clean and neat, the good order of the households impressed the visitors favourably. It may be added that there are few books to be met with, and that only one man in the islands—Webb, an Englishman—can read and write.

It may easily be imagined that the wants of the settlers are neither numerous nor hard to satisfy. Clothing and calico of a light texture, salt, soap, tobacco, hardware, nails, knives, tools of useful description, and ammunition, comprise their chief wants; and for these they have been hitherto indebted, in exchange for their island-produce, to passing whalers putting into the islands for refreshment. On the occasion of Mr Robertson's visit, a goodly supply of presents, consisting of blankets, cottons, grocery, and other useful articles, was forwarded for the use of the settlers by the Japanese government; nor were their needs overlooked by Captain Church, who provided them

with shirts, shoes, flannel, and other necessary gear from the stores of H.M.S. *Curlan*.

Mr Robertson mentions some thirty varieties of wood growing on the islands. Wild-cactus, curry-plant, wild-sage, and celery are also found; and mosses, lichens, and ferns are said to abound. Of metallic minerals, excepting some traces of iron pyrites found in Peel Island, there would appear to be no indications. Earthquakes and tidal waves are frequent. The peculiarity of the latter is that no bore rushes up the harbour; the water rises suddenly—precisely as it rises in a bowl in which an inverted tumbler is plunged—and as suddenly recedes. The earthquakes are probably slight, as the inhabitants do not seem to dread them. Hurricanes, which prevail it is to be presumed at the change of monsoon, are more serious in their consequences, especially to the crops.

Of the inhabitants as he found them Mr Robertson speaks by no means unfavourably. Rumour, he says, ascribed to the settlers of the group a character for lawless life and irregular conduct, of which, however, he saw no evidence. He found a small colony of a simple mixed race, living to all appearance in decency and order, clean in their persons, neat in dress, and dwelling in comfortable homes, to which they hospitably invited the stranger. But to this bright side of the picture there is a dark reverse. Of religion they know nothing; they are utterly uneducated, and are as apathetic as the savage to all but the pressing needs of every-day existence. Owing to the want of government amongst themselves, human life has at times been somewhat insecure, one of the settlers having informed Mr Robertson that within an experience of twenty-five years eleven men had to his knowledge met with violent ends; this however, is to be accounted for by the fact that the islands were the refuge of the runaway scum of whalers and trading-ships, among whom quarrels must have been of common occurrence. Notwithstanding this, the islanders appear to feel some repugnance towards settled government, and ask that they 'may be permitted to live as Bonin Islanders.'

Let us hope that some good may result from Mr Robertson's visit, and from the ample and exhaustive report of the little group which he has given to us; and that the attention of the governments which claim its possession may at least be drawn to the responsibilities which they have undertaken. We have seen that England, through Captain Beechey, and Japan on more than one occasion, have claimed the ownership of the islands; and on one or other of these powers would seem to devolve the natural duty of guiding the young settlement through the perils of a peculiarly dangerous infancy, and of laying the foundation of a happy and prosperous community in the distant Pacific. Japan is manifestly unfitted for this. She has proved herself unable to colonise the magnificent island of Yesso, which lies at her very doors, and which, permanently settled, would have afforded her a powerful bulwark against the Russian aggression she so constantly dreads. There is little probability of her proving a wise administratrix of the Anglo-Melanesian settlement which she has repeatedly tried to colonise, and as often abandoned. It is left to England, therefore, to take this group beneath her protecting wings, and

to initiate some simple and inexpensive system of self-government there; or, failing this, to renounce definitively the sovereignty of the islands, claimed on her behalf by Captain Beechey in 1827.

A CHAPTER OF REAL LIFE.

MANY years have elapsed since the circumstance about to be recorded took place. Most if not all of the actors concerned in it are dead, and the sensation it caused in the neighbourhood where it occurred is long since forgotten. In what follows—a plain statement of facts—all allusion to time, names, or locality is for obvious reasons omitted.

Mr S—, as for convenience we shall call him, was a country gentleman of fortune and rank. He had married young, and very happily; but his home was childless; and the disappointment—keenly felt—was aggravated by the fact of there being a title in the family, to which his son, if he had one, would succeed. Great, therefore, was the joy and exultation when, after years of hope deferred, it was announced that the nursery at Blank House was likely to have at last a baby tenant. Much preparation was made for the event, which it was arranged was to take place in London. A confidential servant, who had formerly as head-nurse had the care of Mrs S— in her childhood, and was devoted to her, was installed in the house, to watch over her health in the present circumstances. This woman on quitting service had elected to become a ladies' monthly nurse, and for this purpose had, as it is called, 'taken out her practice' in a maternity hospital; and had passed the examinations needful before obtaining the certificate of a duly qualified nurse.

Mrs S— professed implicit confidence in the skill of her quondam servant. It was her wish to be attended in her confinement by her alone. She represented to her husband that she preferred a female attendant to a doctor, and so worked upon him that he at length gave a reluctant consent; stipulating, however, that when the event was imminent the doctor was to be sent for, so as to be at hand in case of any danger or difficulty supervening.

Nothing untoward did happen. The lady, under the nurse's care, gave birth to a little daughter, which before the doctor left the house he saw, and pronounced to be a fine healthy infant. The sex of the small stranger was of course a disappointment; but anything in the shape of a baby was welcome in the long childless house. And when in process of time there came the expectation of another olive-branch, hope revived of better luck on the next occasion. Nor was hope deceived. With great triumph, the faithful nurse, again in attendance, announced to Mr S— that his wife was safe, and congratulated him on being the father of 'the finest boy that ever was seen.'

The young heir throve apace. But the parents were ere long doomed to prove what so often happens—namely, that blessings ardently coveted, fail when granted to give the happiness expected from them. With the arrival of his children Mr S—'s domestic felicity departed. His idolised wife became a confirmed invalid. After the birth of the first infant her health and spirits began gradually to fail, and now the whole nervous

system seemed hopelessly disorganised. In vain every means that wealth could procure or affection devise was resorted to. In vain she was taken from one place to another for change of scene and the best medical advice. Nothing could rouse her from the state of gloomy depression into which she had sunk. Instead of its former smiles and brightness, her face, if we may use the expression, wore a kind of 'hunted' look, painful to see. She took no interest in anything; even her children gave her no pleasure; nor did she ever rally from this melancholy condition; so that it was almost a matter of thankfulness when death came to end her unhappy existence.

The bereaved husband, however, continued long to mourn the wife to whom he was so tenderly attached. He lived in seclusion, forming no new ties, and devoting himself to the care of the children, now growing up to be objects of interest. From this state of things he was roused by a letter purporting to be from a person on her death-bed, who urgently entreated him to come to her without delay. She had, she said, a communication of the utmost importance to make, which could be revealed to no one but himself.

Mr S— lost no time in obeying the mysterious summons. Having seated himself beside the dying woman's bed, she addressed him with: 'I see sir, you do not know me. I am Nurse B—. I have sent for you to tell what has lain like lead upon me for years—what killed my poor mistress, and what will be a blow to yourself you will scarce be able to bear. But it must be done. She made me promise that before I left the world I would confess my crime and hers. My crime it was sir, for I planned it all, and over-persuaded her, poor dear!

'Mr S—, the children you are bringing up are not yours! For the fraud that has been practised on you respecting them, I alone am to blame, working as I did without ceasing upon your dear lady's anxiety to give you the heir she was pining for, and that your heart was set on—she that loved you so well, she could not bear to see you disappointed in anything. My calling as a midwife gave me, I urged upon her, plenty of opportunities to carry out the scheme; and I knew I could manage it so that there wouldn't be the least danger of ever being found out. But it was a long time before I could get her to consent, and of course when she once did, there was no drawing back.

'The daughter reared as yours, is the child of a poor servant-maid whose husband had deserted and left her to her fate. I heard of the distress she was in at the prospect of becoming a mother, and disguising myself so that I could never be known again, went to her, and said I knew of a lady who wanted to adopt an infant, and would pay handsomely for hers when born, provided no questions were asked. She was only too glad to close with my offer. I gave her a note addressed to A. B., with directions to have it left at a certain shop the minute she took ill; and when I knew it was near her time, I went daily to inquire after it. The people in the shop thought the veiled and muffled-up woman who called so often for her note in the dusk of the evening was some needy servant out of place. Oh, I took my measures well!

'At last the note was there. I hurried home,

got my mistress to bed, and spread the tidings in the house that she was indisposed, and a baby might soon be expected. I told you sir, the same thing, if you remember, on your return home from your club, and said you might now send for the doctor, whom you wished to be on the spot in case of accident. When he came, I had an interview with him, said I thought all would be right, and that I would call him if he was wanted. When the house was quiet, and every one safe out of the way or in bed, I slipped out with my latch-key. The porter in the hall had been ordered to watch. He roused up as I passed his great chair, and I said I was going for something I required for my lady, and would not be long away. A monthly nurse, you know sir, can do pretty much as she likes in a house, and need not give explanations of her goings and comings. Before I reached the woman's lodgings the infant had been born. I brought it home, terribly disappointed at its proving a girl, and with the prospect before me of having to contrive and do all over again.'

Brokenly, and with many stops from emotion and weakness, the dying nurse gave these particulars. She went on to describe the remorse that took possession of Mrs S——, and the difficulty she had in persuading her to allow of another attempt to accomplish the desired object. The boy, she said, was the son of a poor couple overburdened with children, and the more readily parted with, as his father had died from the effects of an accident shortly before his birth. The same precautions for secrecy had been adopted in his case. There was not the slightest clue, and the fraud could never have been suspected or found out.

But the conscience-stricken lady could not rest. In despair at witnessing her sinking under the misery of which Nurse B—— accused herself of being the cause, the latter implored her to make a clean breast and confess all to her husband. He would forgive her, the woman urged, sooner than let her die. But the hapless sufferer could not bear to criminate herself in his eyes, and risk the loss of this love. So she carried to the grave the burden of the guilty secret that was crushing her, having exacted from the nurse a solemn promise that before her death she would reveal all to Mr S——.

When, after long absence in foreign lands, the latter came to reside again at Blank House, he was accompanied by the young girl, his adopted daughter. What became of the supposed heir, who doubtless had been well provided for, did not transpire.

NEW USES OF PAPER.

THE world has lately heard of some extraordinary uses of paper. In devising new modes of utilising this article, Americans take the lead. Barrels composed of straw-paper are said to be manufactured by a New York firm. The pulp is subjected to a powerful hydraulic pressure; and when reduced to the required thickness, the halves are cut off at the end, and the pieces are then placed in a steam-drier, the sides trimmed evenly, and the substance thoroughly dried. The advantages of the barrels over wooden ones, we are told, are

lightness, cheapness, durability, and the prevention of flour from sifting out while in transit. They are constructed entirely by machinery, and the halves are cut so true that any pieces of the same size will readily fit together. Even as a protector of the bottoms of iron ships from rust and animal and vegetable growth, paper has been found effective. Various anti-fouling compositions have been applied to the purpose; but while all are expensive, none can be regarded as completely satisfactory. It has been proposed then simply to cover the bottoms of vessels with paper; but the difficulty has been to procure a marine cement which would serve to attach this material. After various trials, a cement has been invented which promises to be successful since it has been practically tested by a long voyage. As the paper was found in a good state of preservation, its trial as an anti-fouling agent was considered very satisfactory. This new use for paper has thus far been proved in sea-voyages; and with regard to land-travelling, it is well known how railway carriage-wheels have been manufactured from the same material. For this purpose the paper is cut into disks the diameter of the wheel, less the thickness of the tire, and subjected to a very great pressure, and then secured by iron flanges held by bolts passing through them and the paper. The wheel then receives a steel or iron flagged tire. Many advantages are claimed for the use of paper for this purpose; no other material of the same weight of which a wheel may be made, being considered to possess such strength. Mention of railways reminds us of the telegraph, and even with this indispensable accessory of railway traffic we find the subject of our article has something to do. Telegraph wires can be covered and insulated with paper-pulp, which may be applied either to a naked wire or to a wire which is already covered. The purpose of the paper covering is that of protection from injuries of the inclosed wire, or of the inclosed wire and material surrounding it; the injuries to be guarded against being of a mechanical or chemical nature; or the purpose may be for the electrical insulation of the wire, or for the strengthening of it, to resist strains.

In more general ways, there are various uses to which paper may be applied, as, for instance, the protection of plants in uncertain weather by old newspapers, which are recommended for this purpose. They are said to exclude a considerable amount of frost, and are useful inside frames with or without mats. The uses for which *papier-mâché* has been adapted seem to be almost endless. The possibility of its successful application to building purposes has been demonstrated; and now we hear that a Breslau firm have succeeded in making chimney-pots of paper. They are said to be far more durable than metal ones, as they are not liable to any form of corrosion, while being also lighter and far cheaper. Before the paper-pulp is moulded and compressed into

the required shape, it is treated with chemicals, which render it non-inflammable. Pulp made from wood has been taken in hand by cabinet-makers as well as paper-manufacturers. Mouldings are made of this substance for frames and decorative purposes, which have all the sharpness of outline possessed by the best carvings. Some of the French furniture-makers are said to have expressed great satisfaction at the new style of ornamentation, which will enable them to turn out their 'old oak-carvings' at a minimum cost as far as labour is concerned.

If paper may have something to do with the furnishing of our houses, it can take part none the less in respect to the manufacture of clothing and articles of dress. Some years ago, the most common if not the sole material for handkerchiefs in Japan was an almost diaphanous square of paper, the gossamer texture of which did not prevent a considerable degree of tenacity. Paper collars are common articles of wear; and cloth has been made from the Californian cactus, a plant which has been successfully used in the manufacture of paper. Brown paper may be recommended as a good lining for the garments of ill-clad persons, as likely to prove a protector by no means contemptible in severe weather.

The quantity of paper now issued from numerous newspaper offices in a single week amounts to many tons in weight, and supposing sheet were added to sheet would reach thousands of miles in length. There are said to be many more paper-mills in the United States than in the British Isles; and the exports of paper from that country have we are assured greatly increased. In the international paper Exhibition of Paris, five hundred and thirty-five firms, including most of the leading houses in Germany, Austria, England, France, Belgium, Holland, Denmark, Sweden, Russia, Italy, Switzerland, and the United States, contributed. Besides every variety of writing and printing paper, there were special departments for paper-hangings, paper-blinds, and paper for building purposes, the general applicability of the article being also demonstrated by a paper-house erected in the court-yard with tables, chairs, chandeliers, and stoves of the same material. No part of the gallery of machines in the late Paris Exhibition was more patronised than that in the French section, where old rags were converted into pulp, dried, pressed in plates, and then wound round a bobbin as paper. The English and French display of white and coloured paper was excellent in point of solidity, equality of pulp, tenacity, and gram; and the English cream-laid was thought to be unrivalled. The French show of fantastic letter-paper was very fine; and the American paper was remarkable for its suppleness, resistance, and brilliancy. The silky paper of Japan too, so much in repute as exhibited in envelopes, was considered to be worthy of any paper-factory. Those curious people the Japanese do wonders with paper in the way of toys, lacquer-ware, and such articles, for example, as the imitation of stamped and embossed leather. The originality, colouring, and design exhibited in their wall-papers are

also worthy of all praise. In short, to touch on the numberless purposes to which paper has already been applied would greatly exceed the limits of the present article; but a very important future may be augured for this useful material from the examples here referred to.

A SUMMER-DAY RÉVERIE.

JUNE's blooming flowers and fragrance sweet,
Forth to the woods beguile our feet,
With unresisted spell;
Fond memories lure us to the spot
Where grows the blue Forget-me-not,
The flower we love so well.

Bright flower! to love and friendship dear;
Thy name falls softly on our ear,
With sweetness ever new;
Wafts back our thoughts on Fancy's wing
To sunny memories that cling
Around thy petals blue.

Unmarked the moments as they flow;
When seen in light of long ago,
How precious in our eyes!
Our yesterdays, too fair to last,
To day, when numbered with the past,
Surpassing bright shall rise.

Why should we thus regretful sigh
For sunny pleasures long gone by,
And present joys forget?
To-day let us the ambrosia fall,
And blooming flowers our hearts enthral,
In dewy fragrance wet.

And lovelier sweeter joys are ours
Than sunlit skies or dewy flowers
Could e'er to us impart,
For us the wondrous world of Thought
Rings us from every clime his lionet,
Enriching mind and heart.

For us to-day, in life's core,
Nature and Art their treasures pour,
And love sweet offerings bring,
Ah! whisper not of Time's decay,
Though all of earth must pass away,
Earth lifts her drooping wing.

Not in the sunny Past our rest,
Nor present joys shall end our quest
For full and perfect bliss;
Revealed alone to Faith's glad sight
Where time nor change our hopes can blight,
A fairer world than this!

EFFIE.

GALASHIELS, June 6, 1879.

A RAMBLE IN THE BASQUE PROVINCES.

To the many Englishmen who delight in strapping on a knapsack, exploring wild mountain-paths, and in one word roughing it, the Basque Provinces offer a great attraction. After crossing the Pyrenees, the scenery on the south side will be found of a grander type than on the north. The people will interest him by the great difference of language, manners, dwellings, and food from those of France. Descendants of an ancient race, they proudly boast that they were never conquered. Their men fought with the victorious Hannibal against the Romans, and assisted in the defeat of the Emperor Charlemagne and Roland in the pass of Roncesvaux. By their aid the Duke of Wellington carried a division of his army across three fords over the Bidassoa, and thus turned the strong position of Marshal Soult, gaining his first footing on French territory.

In travelling through these attractive regions, the pedestrian need have no fear as to quarters. Every evening a lodging may be found, though not of the best; some man or boy taken up on the road acts as guide, and they boast of being the best walkers in the world. How picturesque too, in their costume! A red *beret*, not unlike the cap of the Lowland shepherds in Scotland, a red sash round the waist, sandals made of hemp on the feet, and a stout stick or *espadrille* in their hands.

Rising early, the pedestrian is free to wander at will through the woods, or breathe the pure brisk air of the mountain. Nature still sleeps, but soon the sun piercing the clouds, spreads his golden light over the charming landscape; then comes a concert of humming insects and carolling birds, and the labourer appears in the fields. A poor cottage in the valley will give a resting-place; on a wooden bench, before a rough table made of two chestnut beams, the family offer you a share of their homely repast. Bread made of maize-flour, hot from the oven and yellow as gold, beans or cabbage, a sardine, and a handful of nuts; such is the *menu*. The traveller brings

the appetite to season all. The Basque carts come rolling slowly over the road with massive wheels without spokes, cut out of the trunk of a tree in one single piece, and drawn by little red oxen. The sounds produced by the ungreased wheels of these primitive wagons are somewhat grating to the unaccustomed ear, but nevertheless serve the purpose of a warning in the narrow mountain-paths; a good 'singing' cart being their boast!

The loveliest sea-coast lies to the north of the Iberian peninsula, in the province of Vizcaya; and when the town of Plencia comes into sight, another Bay of Naples seems to greet the traveller. Built on a narrow tongue of land which stretches into the ocean, Plencia is literally bathed by the waves. All along the road the vines are grown on trellises, supported by stone pillars, the slope from the foot of the mountains to the shore being covered by porticoes of verdure. Once its ships were known in every sea; not less than a hundred and fifty merchant-vessels having sailed to distant lands during the last century. Now there is not a single fishing-boat; for the banks of sand which have formed at the entrance of the river render the passage of the bar most dangerous.

If the fine fishing population of Spain is to be seen to advantage, the mountain heights must be crossed to Bermeo. But climb the high peak of Machichaco, and the fatigue will be forgotten when the Bays of Baquio and Bermeo are descried extending calm and tranquil at the foot, with the white sails of the fishing flotilla dotting the blue ocean. Bermeo is a child of the sea with a past and present history confined within the space of a few hundred yards on the narrow peninsula of the port. On the one side is the ancient church of Santa Eufemia, one of those entitled *juraderos*, because a new governor of Vizcaya is obliged to enter and to swear solemnly that he will obey the *fucros* or laws. Opposite, is an old square fort, whose stones, from the effect of centuries and the warm kisses of the sun, are of a bright vermillion. Between these are the fishermen's houses, with their wooden balconies and overhanging roofs.

The fishermen are formed into a fraternity, having an administrator and a *junto* to manage their affairs. They make the rules; and in case the sea is too rough, the captain of the *Senora* raises his oar into the air, and no one dare go off. Each evening they manage the sale by auction of the day's produce, retaining a certain portion as a reserve fund, and dividing the remainder according to the success of each boat. Sometimes the stormy weather prevents their going out for many days together, and great would be the distress were it not for the help of this fund, which also provides for aged fishermen and the widows and children of those lost at sea.

In the morning the scene is quiet along the quay, when the nets are hanging and the children preparing the bait for their fathers, or dipping the fresh sardines in the boiling oil and laying them carefully in the boxes. But in the evening the scene is much more animated. Then, the boats that started with the tide return, from the large ones, manned by sixteen men, to the small canoes, which a father and two sons can handle. About seven o'clock, certain important persons come down, dressed in coats and hats; they are the curers and merchants. Women and children crowd round *en masse* to see the fish being sold.

The auction is held in the hall belonging to the fraternity. Enormous scales are hung under the portico, and there the fish are laid in heaps to be weighed. By the light of a large lantern a clerk rapidly takes down the figures, and the fish are immediately packed in round baskets, which the oxen draw into the town. It is a remarkable scene: the noise of disembarkation, the shouts of the seamen, the chatter of the women, the lowing of the cattle, and the immense hideous heaps of tunny and stock-fish gaping for life, as they are viewed under the yellow light of the lantern. This lively affair lasts into the early morning hours, until the last boat arrives, when all retire to their well-merited repose.

Sometimes on fortunate days the men will bring twelve or fifteen thousand *arrobes* (of twenty-five pounds each) of these large fish; and the rule is, that all shall be sent away within twenty-four hours. A portion is immediately consigned to Madrid and other large cities; the rest goes to the curing establishments. There each fish is cut into thick slices, and plunged into large caldrons of boiling oil. When it has received a fine red tint, it is withdrawn and taken to the drying-rooms. When scarcely cold the slices are packed in small barrels, a mixture of water and vinegar is poured over, after which they are forwarded to the interior, where the working-classes buy them largely. The sardine and anchovy abound also in the season; these are preserved in boxes, and each boat sells its 'take' at a price the crew agree upon. The fish of this sea is considered immeasurably superior to that of the Mediterranean; when eaten on the spot it is really exquisite, and has a flavour that would scarcely be believed by those who taste it in Madrid.

There are about a thousand men in Bermeo engaged in this trade. The women help in unloading or at the curing-houses. They marry very early; at eighteen every fisherman has his lover. He makes one or two long voyages, to gain sufficient money for his marriage outfit—not a very sumptuous one, consisting of little beside some white linen, two or three poor bits of furniture, and a few gewgaws; and thus the pair begin life. Should he wait ten years longer, he knows he will never be rich; there being bad days in which his whole fortune may be lost. This continual uncertainty and constant struggle against danger influences the character, and leads to improvidence. After a good season, Bermeo fishermen will rather squander their earnings than put them aside for a worse day. Their families are large; both boys and girls are early put to work; but as there is no class of people more laborious or more honest, the judge has often but one culprit brought before him in a year. They are of the pure Basque blood, and very handsome. The slender muscular frame of the men, with oval face, aquiline nose, and clear eye, mark a serenity combined with singular energy of character. As for the women, before work has tried them, they represent the ideal of beauty—tall, well made, with splendid chestnut hair, which the married women roll round their head, and the young ones wear in two long plaits over their shoulders. A dozen of these walking from the port, each with a large basket of fish on her head, and singing some refrain of the country, in the silence of the night, forms a very striking picture.

Not far from Bermeo there is a little place which has the importance of a holy city in the eyes of the Basques. This is Guernica, which contains the palace of the *juntos*; the archives of the country—the palladium of their liberties; and the oak, under which from time immemorial the Senor of Vizcaya swears to maintain the laws. A son of the country has written a patriotic hymn upon it, which touches every heart, like *Auld Lang Syne* or the *Marseillaise*. He was a poor shepherd, but full of courage, who joined the ranks of Don Carlos V. at sixteen, and being terribly wounded, he withdrew into exile, and remained twenty years in France. He had a fine voice, long curls, and loved peril and excitement. Returning to his native land he became a wandering poet, and sang his own compositions to the crowds who flocked to the mountains from every farm and village. None was so great a favourite as *The Tree of Guernica*, that holy symbol of their liberties; and so great was the enthusiasm created when he sang it, that the men fell on their knees and swore to die for their laws. The authorities were alarmed, and for fear of trouble ordered the poor troubadour to leave the country and remain in exile for life.

As soon as a traveller enters Guernica, he is at once conducted to this tree. The present one is about a century old, and is a direct descendant of the first. Two or three young scions are always growing beside the more ancient one. The last, which fell from age in 1811, existed, according to tradition, from the middle of the fourteenth century. Under its shadow, Ferdinand and Isabella, seated on the bench which surrounded the trunk, took the oath to respect the *fueros*. The deliberations of the congress always took place

in the open air, until the number of delegates so much increased, that the plan was abandoned, and the ancient church of Santa Maria was adopted as the meeting-place.

Amidst the greatest loveliness all around, there rises the battlemented donjon of Arteaga, situated in a grand demesne. It belongs to the ex-Empress of the French, one of the Montijos. In the year 1856 the Assembly declared the late Prince Imperial a Viscayan, and sent deputies to the court with the decree. Napoleon III. received them with much kindness, and the Empress decided to restore the castle. The primitive structure has been retained as much as possible, but accommodated to the requirements of modern comfort. Red jasper surrounds the arched windows, and contrasts well with the gray marble of the edifice. In the interior, a splendid staircase, floors of marquetry, and sculptured ceilings, correspond with the exterior magnificence. Unfortunately, it has never been furnished, but waits the promised visit of the Empress; whilst a French lady who lives in a pavilion near has the charge of it. But though absent, the generous hand of the owner is felt everywhere; there is no better kept village than Arteaga, and the houses have an air of the greatest comfort.

The flourishing commerce of Bilbao has to some extent injured the smaller ports on the coast. After visiting the old towns covered with the dust of ages, Bilbao forms a complete contrast by its modern aspect and bright animation. Yet it has suffered terribly from war. One of its most intelligent and distinguished citizens, Don Juan Delmas, suffered losses that can never be replaced. He was a passionate lover of art and antiquity, and having collected a library of six thousand precious volumes, many old Flemish and Spanish pictures, with jewellery and medals, he built a château, and arranged them in the different rooms. But during a siege, the heart-broken Delmas watched the burning of his home, and his *chefs-d'œuvre* stolen and dispersed. His town-house was riddled by bomb-shells; his wife and one of his daughters died, exhausted by fatigue and terror; his two brothers-in-law were shot; and in the course of a couple of years he had known the utmost limits of what a man could suffer.

When we last visited Bilbao a festival was at its height. From the neighbouring villages had assembled young men gay in their scarlet caps, and handsome girls in short petticoats and braided tresses. Near the church, the favourite game of the Basques, that of tennis, was going on. There is no hamlet however small without its tennis-court, where the young men play in the presence of the elders, as judges. Many can maintain the ball in the air for several minutes. The women also display wonderful skill in this exercise. The favourite dance is a very complicated one, called the *zortzico*; it lasts about twenty minutes, and fourteen persons join in it. The alcalde sits at the head, and the dancers form a circle before him. The young men from each village have a right to dance successively, and their names are inscribed on a list given to the alcalde, that there may be no dispute. At the beginning, the simplicity of the measure, the solemnity that regulates the steps, recall the old French minuet; but as it proceeds,

all join in couples, *vis-à-vis*, with arms extended, using their fingers like castanets; quicker and quicker goes the music, until it finishes with the most rapid of *galops*.

During the festival, refreshments of a simple character are sold at small tables under the shadow of the trees; they consist of dry cakes, cider, and an inoffensive beverage made of red wine, sugar, and water. At the first sound of the evening bell for the Angelus, whatever may be the excitement, the dancing stops; the magistrates take off their hats, as well as the crowd, and all repeat the prayer. Then the *tamborilero* precedes the magistrates, who march round the square; whilst the men withdraw with loud sharp cries, to shew their joy; and the mountains repeat the echo. Great bonfires are lighted, and the popular dances of the *jota* and *fundango* succeed each other until eleven o'clock. When the fire dies out, the couples separate with an adieu, and slowly retire through the streets to their homes, with the respect for law and authority which distinguishes this much to be admired people.

YOUNG LORD PENRITH.

CHAPTER XL.—SIR LUCIUS.

SIR LUCIUS LARPENT, in no enviable frame of mind, sat before the fire in the billiard-room of Llosthuel Court, gazing at the glowing coals, as though, like the reputed wizards of a bygone age, he sought to read the future of his own and others' fortunes in their cavernous depths. He had a cigar between his lips; but its fiery tip had grown cold and gray through sheer forgetfulness on the smoker's part, and presently he snatched it away and tossed it peevishly into the fire. Then he turned to a little table beside him, on which stood a silver tray, bearing glasses and decanters, and filling a large wine-glass to the brim, not with sherry, but with strong Maraschino, tossed off the contents as if the potent liquor had been harmless cold water. Then he refilled the glass, sipped slowly and relishingly the cordial within it, and setting it down, drew a letter from his pocket, unfolded it, and began to read it.

The letter in question had been brought up-stairs to Sir Lucius that morning along with the cup of chocolate and slice of toast which formed the baronet's apology for a breakfast. Sir Lucius had perused and reperused it several times since then, and each time with an anxious eye and frowning brow, which shewed the tidings it imparted to be the reverse of agreeable. It was not a long letter, nor was it one of those stiff epistles on blue office paper wherewith gentlemen learned in the law vex the souls of the laity, unskilled in legal jargon. Indeed it was obviously the letter of no gentleman, whether by Act of Parliament or otherwise, but of a person to whom penmanship was a pain, and orthography a distress, the curt product of severe toil at the scribe's distasteful task.

The reading of this letter, whatever it was, had stirred the ignoble nature of Sir Lucius to its lowest depths, and he was savagely intent upon

the means of counteracting, without mercy or scruple, the course of events which thwarted his most cherished projects. Without mercy or scruple—yes, the words were true as to the baronet's compassion for a foe or as to his readiness to remove a stumbling-block from his path—but there was a scruple, notwithstanding. The exemplary young dandy did not wish to put his precious neck in jeopardy of ever being subjected to the clammy touch of the hangman's fumbling fingers. And for this reason he desired to find a bolder villain than himself, some one—to quote that old Earl Angus who hanged King James's favourites over the Brig of Lauder—who would 'bell the cat.' And he thought he knew of such a one at Tregunnow.

Sir Lucius rang the bell. 'Bring me something—a sandwich,' he said, when the servant came; 'nothing else; and be quick! There is sherry here. And tell Phillips to put the brown horse, Lightfoot, into the dog-cart instantly.'

'Groom with you, Sir Lucius!' asked the under-butler, as he brought in the desired refreshment.

'No groom; but let them look sharp!' answered the baronet gruffly. 'No need, either, to come worrying round to the door. I'll get in yonder, in the yard.'

Sir Lucius had been gruff and irritable all day long, short-tempered even with his imperial mother, rough with young Willie his brother, and snappish to Edgar, who had come in with a stripling's frankness, to challenge his senior to a game at billiards.

'Billiards! Knocking the balls about, you mean. No; thank you!' had been the baronet's cross-grained reply; and he had been left thenceforth to the hermit-like possession of the billiard-room.

Slowly and painfully, according to such lights as his keen but shallow intelligence could work by, Sir Lucius had shaped out and solved the problem that perplexed him. He must go to Pen Mawth. He must see the Black Miller—a tool useful for his purpose. What such men as Sir Lucius can never be made to see is, that such tools are two-edged; and that the ruffian or rascal they hire to do any dirty work with tongue or pen or bludgeon, is the most dangerous enemy, of their own making, that can be like a lion in the path.

It was easy for Lady Larpent's titled son to leave Llosthuel without having to answer inconvenient questions. He had refused, on slight grounds, or none at all, to be present at luncheon. Few young men, in country-houses, are to be seen at luncheon. It is not easy to get back from the stubble-fields, and from hunting impossible, when the ladies of the family are ready for the blameless enjoyment of their cutlets. But Sir Lucius, who ate no breakfast, could not well wait till eight o'clock for the prandial meal, and he was usually hungry by two. Hungry or not, he had his sandwich and his sherry, took up his overcoat, and went round to the yard, where his dog-cart, with the brown horse harnessed, stood ready.

'Like me to wait—anywhere, Sir Lucius?' said a pert dwarf in gaiters and striped waistcoat, a young London lad, mews-made, and who regarded the son and heir of the potential Dowager as only governor No. 2.

The ferocious reply which was made by the baronet as he drove rapidly away, was long remembered in the stable-yard of Llosthuel.

A dog-cart is a vehicle capable of rapid locomotion, especially with only a single sitter behind the shafts; and Lightfoot was a good horse. The Cornish carters stared at the speed with which the gentleman, flogging hard—for Sir Lucius was a hard taskmaster to the noble beast which some of us love so well—shot past them. The brown horse was all lather and foam when he came at a hand-gallop up to the station, twenty minutes too soon, and was left at a public-house which miners and market-folks frequented, while Sir Lucius took his ticket for Tregunnow. He took a ticket—not a return one—for Tregunnow, because he thought that thus, in case of need, he should best escape inquiry and recognition. And when the slow train, fraught with little but fish-baskets, tin, and a few packages marked 'London—Immediate,' and full of precocious vegetables from Scilly, came jumbling in, Sir Lucius took his seat in a mouldy first-class carriage that had the smell of a coffin, and was borne to Tregunnow, where he alighted in a fog and a drizzle of rain.

This time there were no boys at Tregunnow, outside the white gate, and on the gravel-path that was the property of the Company, and the only dry spot in sight. But the baronet, who now knew his way, preferred to dispense with a guide, and walked on, through the waning daylight and gentle rain, to Pen Mawth. He had the dubious good fortune to find the Black Miller—often abroad at fair and market—at home when he knocked. It was Ralph Swart's grim face that appeared in the half-opened doorway.

The Black Miller started a very little when he saw Sir Lucius Larpent at his door, and looked suspiciously out through the waning light and drizzling rain, as though to assure himself that the baronet was unaccompanied. No one save Sir Lucius himself was in sight, so that Ralph Swart relaxed somewhat his mien of scowling defiance, and slowly, and as it were unwillingly, opened his door to the full width, growling, in the deep voice that sounded like the low roar of a lion: 'Come in, if you wish it, young sir. You are free of the place.' Something—it might have been the warning whisper, according to oriental belief, of his good angel—seemed to suggest to Sir Lucius to decline the invitation to enter, to give up the wicked purpose that had brought him out to Pen Mawth, and to make his way back to Tregunnow while the walk could yet be taken by daylight. But he disregarded the impulse, and he went in. The Black Miller closed the door, locking and barring it as usual.

'And now, Sir Lucius Larpent, to business,' he said, roughly thrusting a chair towards the visitor, and seating himself beside the battered kitchen table, on which stood a petroleum lamp, already lighted, for within the house it was dark, and which threw its gleam full on Ralph Swart's strong harsh features and grizzled hair.

'To business, with all my heart,' answered the baronet, assuming a gaiety he by no means felt. 'You see, Mr Swart, that our previous transaction did not turn out, after all, quite so successfully as we thought.'

'I must ask you to explain, Sir Lucius,' said the Black Miller with so stern an accent and

so dark a frown, that the visitor hastened to assume a more conciliatory tone.

'I meant to imply no species of blame to you, I can assure you,' he said; 'you did your work well, and the adventurer, the fisher-fellow, was got rid of, as regards Treport. But here he must needs, as if the Fiend himself were bent on placing him always in my path, find employment in Dorsetshire, close to my uncle's place—Lord Penrith's place, and what is worse, attract my uncle's notice. I am speaking of Alfringham, near the New Forest, which you may have heard of.'

'I have heard of it,' returned the Black Miller shortly.

'I thought as much!' retorted the baronet, and for his very life he could not help giving a malicious intonation to his words. 'Well, there's a station called Hollow Oak on the railway there, and that confounded fisherman has somehow got made station-master.'

'Ha!' exclaimed the Black Miller; and then after a moment's thought: 'Well, Sir Lucius?'

'Anything but well, I think,' replied the baronet irritably. 'This fellow Ashton is a meddling hound, and I shall know no rest until there is an end of his impertinent interference with my family. Some trumpery service he affects to have rendered Lord Penrith.' And as he spoke he drew forth the letter which had preoccupied his mind throughout the day. 'But this, which I received this morning from my good uncle's valet, a certain Luke Jackson, whom I have found it convenient to enlist in my interest, tells the story better than I can. I will just read it aloud, if you please.'

'I will listen,' answered Ralph Swart, fixing his dark eyes, which gleamed like those of a vulture, on his visitor.

Sir Lucius drew a little nearer to the flaring lamp, so that the light might fall upon the writing of the Own Correspondent whose services as spy or chronicler at Alfringham he had deemed it politic to purchase. Then he began—

'HONOURED SIR LUCIUS—In obedience to your wish for news from Alfringham, I beg to say, my lord now is very bad, and no mistake, unable to leave his bed; and Sir Joseph and other London doctors had down to give opinions, with Dr Bland in constant attendance. It came of a railway accident that happened at Hollow Oak, where we all were within an ace of coming to smash, going up to London. We were saved by the presence of mind of the new station-master, one Mr Hugh Ashton, the same, oddly enough, that pulled Miss Maud out of the Welsh lake, and was captain of the steamer at Treport, and got my brother Salem discharged for mutiny; which that he is a fine young fellow cannot be denied. All the country is ringing with his praises for the brave action he did when we had such a narrow shave for our lives; and Mrs Stanhope and Miss Maud were very grateful, and also my lord, that has invited the young man to come up to Alfringham and receive his thanks in person, as I know. But they do say—though what business it is of his I cannot tell—this young Mr Hugh goes about ferreting and raking for proofs about the old murder of my lord's eldest son by his brother, ever so many years ago. I mention this'—

'Ah, indeed!'

Very commonplace words were in themselves these, by which the Black Miller interrupted the reading of the letter, but, from so formidable a personage, and uttered in a tone so grimly significant, they somewhat startled Sir Lucius, who, however, soon went on: 'Because such conduct is singular. Also, in accordance with your honour's wishes, and in part through my brother's assistance, I think it pretty clear that this Mr Swart of the Pen Mawth Mill is no other than my lord's former steward, name of James Grewler, who made off with a heap of my lord's money four-and-twenty years ago, and has never been heard of since. The picture of him on the wall in the steward's house is exactly what you describe, allowing for his being younger then, and I don't wonder the likeness struck you at first meeting. So no more at present, from your faithful servant to command,

LUKE JACKSON.'

'Now,' said the baronet, as he refolded and pocketed the letter, looking the Black Miller full between the eyes as he did so, 'it is pleasant, is it not—Mr Swart, *alias* Grewler—to see our way?'

'Yes,' answered the Black Miller, with a scowl and a flash of his savage eyes, but in a voice that was calm, and almost soft; 'I like to see my way. You wish this young Hugh Ashton to be got out of yours, I suspect. And you come to me to help you, and prove to me very sensibly that you have recognised me, and so have a hold upon me, so that I can refuse you nothing. Have I read your meaning rightly, young sir? Ho, ho!'

And the Black Miller laughed. It was not a laugh good to hear, but deep and hollow, as we might imagine a ghoul's laugh to be. There was an irony, too, in his tone, which to a warier ear than that of Sir Lucius might have impressed the necessity for caution. But he was so pleased with his own cleverness in getting a hold on his dangerous confederate, that it was in a voice of ill-concealed triumph that he resumed: 'We can afford, now, to play with our cards on the table. I am ready to hand you a hundred pounds when I hear that the fisherman fellow can give me no further trouble. Personally, I prefer not to be mixed up in the affair. In Salem Jackson, the blackguard sailor at Treport, I should think you would find a convenient instrument, the rather that he has a grudge against young Ashton. And, as regards the old history of my uncle's cash, I assure you that, if you deal but fairly with me, no one will care to ask for an account of your stewardship, or to identify James Grewler of the past with Ralph Swart of the present. Now we understand each other.'

'Thoroughly,' answered the Black Miller, in the same soft voice as before. 'You may count on me. Especially as I am, after a fashion, in your power, as you will be in mine, ho, ho! when the job is done. Either of us could hang the other. But no need of that.'

'Good-by, then, Mr Swart,' said Sir Lucius, who was in haste to be gone, and with a nod of leave-taking, he turned to the door. Scowlingly, but promptly, Ralph Swart undid the fastenings, and opened the door.

'Good-evening, sir,' he said as the baronet stepped forth into the rain, and then reclosed the door.

'That was the way to deal with the fellow!'

muttered Sir Lucius to himself as he left the Pen Mawth Mill behind.

Meanwhile the Black Miller, after standing for some two minutes in deep thought beside the table on which stood the lamp, snatched up his hat, took down from the peg on which it hung his loaded riding-whip, and went softly out, carefully but silently locking the door behind him.

KASPAR HAUSER.

On the evening of Whitmonday some fifty years ago, a citizen of Nuremberg happened to be loitering near his door in an unfrequented part of the town, when he observed a short distance off an ungainly looking young man standing in a singular posture, having the appearance of one intoxicated, and apparently making attempts to move forward without having the power either to stand upright or to control the movement of his limbs.

The citizen approached the stranger, who immediately thrust into his hands a letter—a letter addressed to the captain of one of the regiments then quartered in Nuremberg. The citizen attempted to question the strange youth; but in reply to his queries could only elicit a repetition of some unintelligible jargon, and therefore conducted him to the guard-room of the regiment. Here the captain's orderly took charge of the unknown, and led him to his master's house. The captain happened to be from home at the time; and as the stranger could give no account of himself in answer to the numerous questions with which he was assailed, and as he did not appear to understand anything that was said to him, he was taken for a kind of savage; and after much consultation on the part of the servants as to his disposal, he was shut up in a stable, to await the return of the captain. The contents of his pockets created the greatest surprise. They consisted of coloured rags, a key, a paper of gold sand, a small horn rosary, and a few religious tracts.

The poor fellow was so much fatigued that his attempts to walk resulted in an unsteady stagger; his feet were bruised and bleeding; and he appeared to be suffering intensely from the effects of hunger and thirst. Some meat was offered to him; but on tasting it he immediately spat it out in disgust. Beer too was given him; but on tasting a few drops of it he rejected it as he had done the meat. Some bread and a glass of water, however, afforded him much satisfaction, and he swallowed them eagerly. After refreshing himself in this manner, he threw himself on some straw in the stable, and almost instantly fell into a deep sleep. He was still asleep when the captain returned home, although several hours had elapsed. Attempts were made to awaken him, but for some time without success. They lifted him from the ground and tried to place him upon his feet; but in spite of all their exertions, the youth slept on, and seemed more like one dead or in a trance, than a living being merely asleep. At last, however, his eyes slowly opened, and as if struck with the

glittering colour of the captain's uniform, he immediately commenced to utter the same jargon he had used to the bewilderment of the good citizen who had discovered him.

The captain knew nothing of the stranger, and no particulars could be ascertained from the letter of which he was the bearer. This letter did not give any clue to the name or previous home of the youth. It was not even addressed to any person by name, and from its style and orthography, seemed to have been intended to pass for the production of some illiterate peasant. The writer merely stated that he was a poor workman with a large family, which he could ill support; that the mother of the stranger had placed him under his care when quite young; that the boy wished to be a soldier, as his father had been. No name was signed at the end of the letter, which closed with this inhuman sentence: 'If you do not keep him, you may kill him or hang him up in the chimney.'

The captain was in a great dilemma with regard to the disposal of the charge that had been imposed upon him in so sudden and unexpected a manner; but at last, when every attempt at questioning had failed, the unknown was taken to the police station. Here they could make nothing of him. The usual interrogations as to who he was, whence he came, what was his business, &c., elicited no intelligible answer, and the authorities were much perplexed to know what to do with him. His tears, the state of his feet, and his childish and apparently harmless demeanour, excited the pity of those who saw him. Opinions as to his real nature were divided. Some considered him an idiot, others thought him a savage. Not a few affected to believe that under this appearance of simplicity some cunning deceit might be concealed.

At the suggestion of one of the officials, pen, ink, and paper were put before him, and signs were made that he should use them. At this the stranger manifested considerable pleasure; and taking up the pen, to the infinite astonishment it must be confessed of all present, he wrote in bold legible characters the words 'Kaspar Hauser.' Here, however, he stopped. All attempts to make him understand that they wanted him to write down the name of the place whence he came, failed; and as a last resource, he was committed to the prison where rogues and vagabonds were usually confined. On being conducted to his cell, he immediately sank on his straw-bed in a deep sleep. Such was Kaspar Hauser's first introduction to the world.

At this time, Kaspar was about sixteen or seventeen years old, and four feet nine inches in height. His chin and lips were thinly covered with down; his wisdom-teeth, as they are called, had not yet come, nor did they make their appearance until about three years later. His hair, which was of a light-brown colour, was very fine, and curled in ringlets. The structure of his body, which was stout and broad-shouldered, shewed perfect symmetry without any visible defect. His hands were small and beautifully shaped. The soles of his feet were as soft as the palms of his hands, and from their appearance, had never before either been used for walking or confined in a shoe. His

face, particularly when in a state of tranquillity, was almost without any expression whatever. He appeared to have little or no idea of the use of his limbs. His attempts at walking were most ludicrous, for they resembled the first toddlings of an infant. He was wholly destitute of words and ideas, and shewed a complete ignorance of the most common objects of nature and the ordinary usages of daily life. In fact, the whole of the circumstances connected with the unfortunate youth were for some considerable time a dark mystery, that baffled even the wisest in their attempts to fathom. He appeared to resemble an inhabitant of some other planet, miraculously and suddenly transferred to the earth, rather than one belonging to the same race of men who now exist.

The only food he could be prevailed upon to take was bread and water. For all other kinds of meat and drink he shewed the greatest aversion. Even the smell of them was sufficient to make him shudder; and the least drop of wine, or tea, or coffee occasioned him cold sweats, or caused him to be seized with vomiting or violent headache. Among the few intelligible words, to most of which he appeared to attach no meaning whatever, that now and then escaped his lips, the one most frequently used was 'Ross' (horse); from this circumstance the idea of bringing him a wooden toy-horse occurred to some of the police officials. At the sight of this plaything Kaspar, who hitherto had treated everything and every one with stolid indifference, suddenly roused up. He seated himself on the ground by the side of his toy, stroked it, patted it, kept his eyes continually fixed on it, and finally endeavoured to decorate it with all the various trifling presents which benevolent visitors from time to time had given him. For hours he would sit by the side of his horse playing with it, taking no notice of anything that was going on around him. Several toy-horses were now given to him, and for each of them he manifested the same affection he had shewn for the first one he received. Even at meal-time he would not be separated from his favourites; and before eating his bread or drinking his water, he tried hard to induce his horses to partake. His plan was to hold his bread to the mouth of each horse in turn, and after that to dip the mouth of each horse in the water. One of the horses happened to be made of plaster of Paris, and the constant wetting had the effect of softening the lips, and by degrees part of the mouth crumbled off. This circumstance caused Kaspar the most intense sorrow, nor would he be comforted until one of the officials had mended his toy for him.

In a very short time after his arrival at the prison, Kaspar was no longer considered as an ordinary prisoner, but rather as a forsaken and neglected child, who needed only care and education to render him like other human beings. The governor of the prison admitted him to his family table, where, although he would not yet eat the same food as the others had, he still learned to sit properly, and in some measure to conform to the ordinary rules of decent society. Kaspar was pleased to have the governor's children as playmates, while they on their part were delighted at the idea of having a playfellow bigger than themselves, and yet with the gentleness and simplicity of a child.

About a fortnight after Kaspar's arrival in Nuremberg, he was providentially favoured with a visit from a certain Professor Daumer, an intelligent young scholar, who forthwith devoted himself to the peculiar and most interesting task of training the virgin mind of the unfortunate youth. The Burgomaster, Herr Binder, also took a very deep interest in Kaspar, and frequently had him brought to his house, where he was encouraged and assisted in his attempts to learn to converse; and where, by carefully avoiding all the puzzling restrictions of legal forms and questionings, the young man was by degrees, as he advanced in his knowledge of words, induced to try and recall some of the incidents in his early life. At the same time the police were still busy with their investigations; but the clue they had to work upon being so slight, they made but slow progress in unravelling the tangled thread of the mystery which surrounded this strange specimen of humanity.

Little by little, however, Kaspar's mind became enlightened, and as his power of expression and his vocabulary increased, he began putting together, bit by bit as it were, those of the incidents of his past life which struck him most forcibly. The account he gave of himself was as follows: 'He neither knows who he is nor where his home is. It was only at Nuremberg that he came into the world. Here he learned for the first time that besides himself and one man who had always had the care of him, there existed other men or other creatures. As long as he could recollect, he had lived in a hole (or small low room, which he sometimes calls a cage), where he had always sat upon the ground, with bare feet, and clothed only in a shirt and a pair of trousers. In his apartment he had never heard a sound, whether produced by a man, by an animal, or by anything else. He never saw the heavens, nor did there ever appear a brightening (daylight) such as at Nuremberg. Whenever he awoke from sleep he found a loaf of bread and a pitcher of water beside him. Sometimes this water had a bad taste; and whenever this was the case, he could no longer keep his eyes open, but was compelled to fall asleep. When he awoke he found that he had a clean shirt on and that his nails had been cut. He never saw the face of the man who brought him his bread and water. In his room he had two wooden horses and some ribbons. With these he always amused himself as long as he was awake. How long he lived in this state he knew not, for he had no knowledge of time. The man who acted as his keeper had, while he was in his little room, taught him to write, standing behind him during each lesson, in order that the face of the teacher might not be seen, and guiding his hand. In this manner he learned to write his name, and also some of the usual words and copies that are used in elementary instruction. After a time his keeper taught him to stand upright. The method employed for this purpose was very singular. The keeper caught him firmly round the breast from behind, placed his own feet behind his (Kaspar's) feet and lifted them as in stepping forward. Finally the man appeared once again, placed his (Kaspar's) hands over his shoulders, tied them fast, and carried him on his back out of the room. The journey must have lasted several days at least, for he remembered having eaten and slept several times. He never

saw the face of his keeper even now, for as he either led or carried him along, the man directed him (Kaspar) to keep his face directed towards the ground. During this time the keeper attempted to teach him to walk, and also instructed him to say the same jargon he had used when he was first observed by the citizen of Nuremberg. Not long before he was discovered the keeper put on him the clothes in which he was found. Then suddenly thrusting the letter into his hands, the keeper vanished. After this the citizen found him almost immediately, and conducted him to the guard-room.

This account, given almost in Kaspar's own words, will go far towards explaining how it happened that the youth's mind was in such a dark state; but it helps very little to shew who Kaspar Hauser really was, or whence he came, or in fact any real particulars of his actual history. That a great crime had been committed by some one, was very evident. Many conjectures were hazarded, and it was only after very considerable and protracted search that it was possible to arrive at any satisfactory conclusions. Link by link the chain of evidence—circumstantial only, it must be admitted—was put together; and finally it was on all sides generally believed that Kaspar Hauser was the product of an illicit alliance. A priest, who was said to be his father, took charge of the child from the moment of his birth, and in time shut him up in some out-of-the-way subterranean vault in the convent where he resided. Here it was that Kaspar, totally secluded from all human observation and knowledge save that of the priest, passed seventeen long years; and here probably he would have remained, had not circumstances compelled the priest to leave the convent; when, having no other convenient place of concealment available, he released the poor fellow and left him to his fate.

The incident mentioned by Kaspar in his account of himself relating to the bad taste in his water, which caused him to fall into a deep sleep, was explained a short time after he had given the narrative to his friends. It occurred to one of them that the priest might have mixed a drop or two of laudanum with the water, with the view of inducing a stupor while the boy's clothes were being changed. One day a small dose of laudanum was put in his glass of water without Kaspar's knowledge. On tasting the water, he recognised the flavour at once, and unhesitatingly affirmed that the glass contained some of the stuff he used to have given him during his imprisonment when a change of clothes became necessary. This circumstance clearly proved the truth of the conjecture.

The accounts that are recorded of the growth of Kaspar's mind are most interesting. Incidents that to an ordinary person would appear of no moment, had a strange and inexplicable effect on him. For instance, as an experiment he was brought into contact with a female somnambulist. Her presence affected him in the most extraordinary manner. He was seized with violent pain and sudden disgust. He describes the interview in his own words as follows: 'As I came into the room and the door of the diseased person was opened, I felt a sudden dragging on both sides of my breast, as if some one wished to pull me into the room. As I went in and proceeded towards

the sick person, a very strong breath blew upon me, and when I had her at my back it blew upon me from behind, and the pulling I felt before in my breast I now felt in my shoulders. The sick person seated herself and said that she was ill. I also said that I was unwell, and that I must sit down. Now a violent beating of my heart came on me, and there was a heat in all my body. This condition lasted until the next morning, then I had a headache again and a twittering in all my limbs, still not so violent.' The somnambulist, curiously enough, was affected almost in the same manner.

On another occasion a spider let itself down from the ceiling on Kaspar's head. Directly it touched him he felt a chill and an excessive degree of cold on his forehead, without knowing the cause. Suddenly putting up his hand to his face, he crushed the spider on his under-lip. Hereupon he felt, for more than a quarter of an hour, a burning pain, which passed away with a tremor. When he retired to bed the burning sensation returned. During the night the lip swelled, and there rose on it several small bladders, out of which there was a discharge of white matter in the morning. The chill occasioned by the spider was of long continuance.

But it was not only by the sight of and contact with living creatures that Kaspar was visibly affected; for we are told that one day he happened to see a particularly fine flower, and on his attempting to pluck it, the same feeling as that caused by the spider came upon him. On another occasion, after eating a ripe grape he immediately became strangely affected, and was compelled to sleep off the effects of the, to him, potent juice.

Although for a long time Kaspar's body was considerably in advance of his mind, yet by degrees he began to overcome many of his peculiarities. Still he could never forget the hardships he had suffered, and the fact of his being inclined to brood over them tended to retard his mental progress.

About four years after his first appearance in Nuremberg, Kaspar was fortunate enough to come under the notice of Lord Stanhope. This nobleman conceived the idea of adopting the strange youth, and having prevailed upon the inhabitants of Nuremberg, who looked upon Kaspar as their adopted son, to give him up, he placed him under a tutor at Anspach previous to removing him to England. But unhappily these benevolent intentions were frustrated, for the same mystery which shrouded his birth hung over his death. On the 14th of December 1833, Kaspar Hauser, while returning from his official duties at mid-day, was accosted in the streets by a person who promised to impart to him the secret of his origin, if he would meet him in the park of Anspach Castle. Without informing his protectors of this circumstance, Hauser imprudently kept the appointment. The stranger was at his post; he took Kaspar aside, and, without speaking a word, plunged a dagger into his breast, and instantly disappeared. Hauser had sufficient strength left to reach the residence of his new tutor, into whose apartment he rushed, and had just breath enough to utter two or three indistinct words, when he immediately fainted, and, after relating the circumstances of his assassination, died on the 17th of the same month. Every expedient which the

police could invent was adopted to discover the murderer, but without success. The secret, which it cost so much crime to preserve, has never been divulged.

TWICE BETROTHED.

IN FOUR PARTS.—PART III.

'A MAN who has land to sell within the four seas of Britain, seldom needs to look long for a purchaser;' such was Leonard Merton's soliloquy as he eyed, somewhat sorrowfully, the pretty Swiss-looking cottage, the slate-roofed farm-house, and the few fields that constituted his only possessions. Although no Welshman born, the young barrister had come to be very fond of this picturesque little property, which he had inherited from a good-natured Cambrian uncle, and which nestled, as it were, in a cleft of the big black mountain range that overlooked the river Arva and the village of Tremadoc. Leonard had been used to spend his holidays at Pen Madrin as a boy, had caught his first trout and shot his first bird on that land, and had scores of humble friends, brute and human, about the place.

Much as he loved the rustic retreat of which he was the master, Leonard felt that he must part from it, and for ever. It would be more than he could endure to be the neighbour of Annie, when settled in the grand house of Plas Madoc as the wife of Sir Albert Atwood. No! Old Jones, the Wrexham attorney, would see that he got a fair price for the tiny chalet and its two hundred acres of barren land; and for its late owner there would remain nothing but London, his Temple chambers, and hard professional work, could he but get enough of such work given to him.

It was with a heavy heart that the young man began to make his preparations for a departure that he intended to be final. Then he received a letter from an old friend and former school-fellow, volunteering a visit of a couple of days; and Leonard felt that even at that juncture he could not but delay his journey that he might receive the self-invited guest. He had known James Haworth long and intimately, although of late the paths of the struggling barrister and of the rising engineer had been somewhat wide apart, and he resolved to put as good a face on matters as he could, during his friend's brief stay.

'Going to leave this, for good and all!' said Haworth, on the evening of his arrival. 'Why, were it mine, I would strain a point to retain the ownership of such a pretty scrap of Welsh Arcadia. The waterfall and the wooded glen are, each in its way, a perfect picture, and— Ah, well! perhaps London is the best, after all, for an active young fellow who wants to make his mark on the world,' added the civil engineer, as his quick eye noted the signs of 'something wrong.' That Leonard, perhaps through some rash speculation, was in debt, and that such was the motive which prompted the sacrifice of Pen Madrin, seemed only too probable.

'You have gained, it seems, such fleeting immortality as the newspapers can confer,' observed Haworth, on the following day, as he and his entertainer rambled about the crofts and meadows, the leafy hedgerows and rugged sheep-walk, to which their proprietor was soon to bid farewell; 'and, without joking, Leonard, I felt proud of my school-fellow when I read the details of that Arva tunnel affair. How, by-the-by, Sir Albert, or whatever they call him, could give the contract to such charlatans as Bounce and Braggett, it puzzles me to say; but of course the fellows are plausible and well puffed—such men always are. It must have been a close thing, the other day, to cheat the coroner.'

'A miss, you know, Haworth, is as good as a mile,' answered the young barrister, smiling. 'A wet jacket, I think, was the extent of the— Why, what are you grubbing at yonder, old man, with that inquisitive stick of yours, among the nettles and dock-leaves. Not a gold mine, is it?'

'Not a gold mine, certainly,' answered Haworth, who by this time was on his knees, and groping with outstretched hands among the weeds and stones. 'A gold mine is a luxury for a rich man; but this, unless I am much mistaken— I wish I had a spade, now, and a hammer.'

'The former, at anyrate, I can supply,' returned Leonard, beckoning to a labouring man engaged in digging potatoes on the other side of the low stone wall; 'and as for the latter, if you really want it, Owen Owen here will fetch one from his own farm, or from the cottage.'

'I shall be obliged to him if he will,' said the engineer, as he struck the spade into the mossy turf; and, at a word or two in Welsh from Leonard, the digger of potatoes set off at a shuffling run, and speedily returned with the required implement. Haworth took the hammer, and dealt several smart taps upon a ringing hard substance that had lain concealed below the rank grass.

'So far, so good!' he said, picking up some splinters of a dark-blue colour. 'And now to see if the bed trends, as it should do, according to what our rough excavators call the "lay" of the land.'

A second and a third exploration, some hundred yards away, seemed to confirm the first opinion of the searcher, who now turned towards his wondering host, and dryly said: 'What rent, now, Merton, do you get for this bit of ground?'

'It's very poor pasture, you see,' answered Leonard, glancing at the dwarf cow and lean mountain sheep that cropped the scanty herbage. 'Owen, yonder, pays but twelve shillings an acre for the grass—eighteen at most, for the arable land.'

'May I ask if Mr Owen has a long lease of his farm?'

'No; he is a yearly tenant,' replied Leonard, in surprise; 'though of what earthly interest the conditions of his holding may be'—

'Turn him out, then!' cried the engineer, scrambling to his feet; 'and compensate him, if you like, by making him foreman of what, I pledge my professional reputation, will turn out to be the finest slate-quarry in the county! Why, the slate of the famous Pennant quarries, or those on the Dinorben estate, which were worth a peerage to their lucky owner, is not equal in quality to that

of these chips that I hold in my hand. These acres of potato-garden and bare pasture will easily bring you in a handsome income—twenty, ay forty fold the pittance they have hitherto yielded. I give you joy, old fellow!’

But Leonard Merton manifested none of the elation which under the circumstances would have seemed natural. A shadow seemed to flit across his handsome face, and he muttered: ‘Too late! too late!’ though in a tone so low that it did not reach his friend’s ears. He was none of those severe Spartans who profess a contempt for riches; and a month or two ago he would have welcomed Haworth’s announcement with frank delight. But of what value was a large revenue to him now, when Annie—with whom it would have been happiness indeed to have shared it—was the betrothed bride of another man! The civil engineer felt more than half-provoked at the passive equanimity with which his former school-fellow treated his new discovery.

‘Upon my word, Leonard,’ he said, ‘you are the very iciest philosopher who ever hearkened, without stirring a finger, to Fortune’s knock at his door! Perhaps you think my talk mere moonshine, and the slate-quarry a chimera? If so, do take the opinion of some practical man. There’s Roberts of Wrexham, or Harrison who has set up at Chester—and see whether experts consider that I have in any way exaggerated the worth of a “find” which raises the value of your property so very greatly.’

‘You are kind, old friend, very kind,’ said Leonard, forcing himself to smile; ‘and I don’t in the least doubt the accuracy of your professional judgment. Only the discovery has come too late, for I have made up my mind not to stay here.’

The bustling, pushing man of business had never in his life been so sorely puzzled. It was with the most genuine pleasure that he had lit upon the unsuspected source of wealth over which so many previous possessors of Pen Madrin had walked in serene unconsciousness, and now it really did seem as though the young barrister were about to reject the good luck that had befallen him.

‘Leonard must be crossed in love’—such was his guest’s shrewd soliloquy—‘or he would never be so strange a Stoic as to sell these acres of beggarly sheep-walk for their market price; or perhaps to leave my acquaintance Owen Owen’s potatoes to ripen over a quarry that ought to ring with the clangour of a hundred pickaxes, and to bring in as snug an income as a moderate man could wish for!’

Two days later the visitor left Pen Madrin in Leonard’s dog-cart, the latter undertaking to drive him to the railway station, which was about a mile on the farther side of the pretty village of Tremadoc, and about three times that distance from Merton’s cottage.

The mare in the shafts of the dog-cart was a young and skittish animal, a bright chestnut, and with the mettle that is common to horses of her colour. Leonard, a skilful whip on most occasions, seemed absent and preoccupied, and handled the reins exceedingly ill, so that more than once some sudden swerve on the part of the mare brought the near wheel dangerously close to the verge of the precipice. It was a steeply

winding mountain road, and an upset might easily imply a sheer descent of ninety feet or so; and Haworth, as he marked the careless driving of his friend, inwardly congratulated himself that the journey was a short one.

The good-natured engineer had been unable to extract from his former school-fellow any definite statement as to his intentions with regard to the property, now so enormously enhanced in value, nor had he ventured to put a question as to the cause of his host’s melancholy. That to sell Pen Madrin for an old song would be a sin and a shame, was the lesson he had earnestly striven to impress; but Leonard had scarcely seemed awake to the importance of the discovery that might swell his meagre rent-roll to one that would not discredit a county magnate.

‘Fine carriage that!’ exclaimed Haworth, as a well-appointed barouche appeared, rounding an angle of the mountain road. ‘A splendid pair of bays certainly; and everything, from the silver-mounted harness to the trim liveries, a pattern of its kind. By Jove, what a pretty girl that is!’ added the appreciative engineer. ‘Neighbours of yours, Merton, I suppose, and— Have a care, dear boy, or you’ll upset us!’ For the hot-tempered chestnut, irritated by a sharp jerk of the bit, had swerved and plunged ominously.

The occupants of the carriage were a gentleman, Sir Albert Atwood, and two ladies, one of whom was young and beautiful. These were Miss Irwine and her mother. As the dog-cart and the barouche neared one another, Annie raised the parasol which had hitherto in part shaded her face, and her eyes and Leonard’s met. As if by an involuntary impulse, Leonard tightened the rein, and at the same moment struck the chestnut a smart blow with his whip. The fiery brute reared, arrow-straight, and then, boring her head, dashed off at a gallop down the hill-road.

‘Why, Merton, are you mad?’ cried his companion, making an attempt to grasp the reins. ‘Pull up, or you’ll go smash into that carriage, and’—

Too late! With a sickening sound of crashing woodwork and rent iron, the light dog-cart came into furious collision with the barouche, and with the customary result of such encounters. The chestnut mare, wild with fear and wrath, kicked herself free of the shafts, and galloped off, with her sides flecked with foam and her harness clattering about her. An axle was snapped and the body shattered of the lighter vehicle, without any corresponding damage being inflicted on the heavier one. Both the occupants of the dog-cart were violently flung out, but with varying fortune. Haworth fell, as the phrase is, ‘soft,’ and was able to struggle to his feet in a moment after the accident. But Leonard, a long thread of blood streaming from his forehead, and leaving its crimson trail upon the dust of the road, lay as if dead, and did not move or moan, almost beneath the very feet of the startled horses attached to Sir Albert Atwood’s superb barouche.

PART IV.

An accident, and especially a carriage accident, happens so quickly, that a few seconds suffice for the work of mischief. It seemed to Haworth, as dizzy with the shock, he stood beside the prostrate

form of his friend, as if but an instant had elapsed since he had first caught sight of the grand carriage and its tenants; and now Leonard lay to all appearance dead, while the shrieks of the ladies in the barouche which had been the innocent cause of the disaster were still ringing in his ears.

'Not killed—good heavens, it cannot be!—he who saved all our lives too!' exclaimed Sir Albert Atwood with honest emotion, as he leaped from his carriage and approached the fallen man. His old school-fellow stooped to lift Leonard's head. It fell back, nerveless and heavy, in the dust. With a cry of passionate sorrow, Annie Irwine sprang across the road, and knelt beside Leonard Merton.

'Killed! Yes, dead—dead! My darling! my own one! my all! Here lies the only man I ever loved, the only one whom I'—

'Annie, Annie! hush, hush! These are wild words, my dear, and you must not, shall not talk thus,' nervously interrupted Mrs Irwine, as she threw her arm around her daughter's waist and tried to draw her away. 'I do not wonder that you are shocked; but this must not be.'

Sir Albert's comely face grew first red and then very pale. What he had just heard was what it would have been exquisitely painful to any man to hear from the lips of the girl whom he was about to marry, and it is no discredit to his manhood if he winced under the ordeal. But he contrived to say, in a voice of tolerable steadiness: 'Not so bad as that—no; the poor fellow is not in such bad case as that.—One of you men,' he added, turning to the servants, 'had better hurry down to Dr Morgan's house. The doctor may be in his surgery now. Or stay—we had better lift poor Merton into the carriage, and drive to Tremadoc. He will get medical care sooner so.'

'The gentleman's not dead, Sir Albert. The blood's trickling yet from that cut on the temple,' said the coachman; while Haworth, with Miss Irwine's aid, gently raised Leonard's passive head. A brook was flowing close by, tinkling amid stones and tall broom, and thence a little water was procured, and sprinkled on Leonard's ashen pale face, while Miss Irwine with her handkerchief stanchied the wound. Feebly and slowly he opened his eyes, and gazed, as with a dulled wonder, on Annie bending over him, and then, groaning, sank back; while Miss Irwine, reckless of her mother's well-meant remonstrances, mingled tender words of love with bitter self-reproaches.

'I cannot bear this!' said Sir Albert, putting his hand to his forehead. 'Annie! Miss Irwine—your words, my dear, cut me to the heart.'

Leonard re-opened his eyes, and seemed, as he looked around, to rally his senses and comprehend the situation.

'I hope,' he said, 'that nobody else has suffered by my awkward carelessness. I—I was stunned, I think.'

'I should never have forgiven myself, Merton,' said Sir Albert, trying to assume a genial cordiality that was out of tune with his thoughts, 'if you had been as badly injured as we at the first feared you were.'

By this time Merton had been aided to regain his feet. He was still weak and very pale, and leaned heavily on Haworth's strong arm; but deprecated the idea that he could be the worse for the tumble; while Annie, blushing deeply as

she remembered what in her first agony of alarm she had said and done, shrank back, and hid her face, weeping.

'It is for me to dry those tears,' said Sir Albert, coming forward and taking the girl's hand in his. 'I am too sincerely attached to you, Miss Irwine—Annie—let me call you, for the last time, by that name—to prefer my own selfish happiness to yours. Fully and freely I release you from your promise. Fully and freely I give you back your troth-plight, and renounce the hopes which'—

He broke down here in his speech, which had been hurriedly, almost stammeringly spoken; but the purport was intelligible enough. Never, perhaps, before had Sir Albert acted or felt so nobly as now, and the evident pain which it cost him to utter the words deepened their impression upon the audience. True, it was Annie's exceeding prettiness that had in the first instance fascinated him, nor was his nature such as to appreciate thoroughly the gentle grace of hers; but he did love her after his fashion, and to give her up was to endure a pang new to this spoiled child of fortune, who had hardly ever in his life known what it was to be thwarted.

Annie threw a quick glance at her mother. Mrs Irwine was trembling and tearful; but she stood silent, with her eyes fixed on the ground, and left her daughter, unbiassed, to reply according to the dictates of her heart. The poor mother had, for her infirm husband's sake, been very much bent upon this match, which promised competence and comfort for the old clergyman's declining years; but not even with such a motive could she bring herself at this moment to attempt to influence Annie's choice.

'You are most kind—more than kind indeed, Sir Albert,' said the girl, endeavouring to speak firmly; 'but I cannot take back my word, thus hastily, even though your nobleness prompts you to offer me release from my engagement. I have been foolish, I know; but indeed, indeed I will do my duty, should you'— Here, however, a burst of sobs interrupted the unfinished sentence, and Annie turned away and nestled by her mother's side, murmuring: 'O forgive me! What have I done?'

'No harm, my darling!' exclaimed Mrs Irwine, as she passed her arm around the weeping girl; 'but you, and I too, should do a grievous wrong did we persist in what would be no better than a sacrifice of your best affections. It would be absolute wickedness, loving your cousin as I now for the first time learn that you do, were you, for our sake, to become Lady Atwood.'

'And so say I,' rejoined Sir Albert himself, as he stepped forward and placed Miss Irwine's hand in that of Leonard Merton; and there was a confused scene of broken words and hurried explanations, and then a general sense of alarm and annoyance lest all this should have taken place in the presence of the servants. But the footman was by this time far on his way to the surgery of that Dr Morgan whose services would luckily not be required, and the discreet coachman appeared to have no eyes save for his horses.

In honest, manly terms Leonard Merton thanked the baronet for setting Annie free. 'I should not, could not have dared,' he said, 'to ask Miss Irwine to be my wife, had I been as poor as, three days

since, I believed myself to be. But now, according to the opinion of my good friend Mr Haworth here, I am prospectively a rich man.'

'You, Leonard!' exclaimed Mrs Irwine, clasping her thin hands together. She was quite ready, now that Annie's heart had been laid bare, and the sin of a mercenary marriage brought home to her, to give up her matronly hopes of a qualified prosperity, and to face penury side by side with her uncomplaining old husband; but this sudden announcement of Merton's seemed too good to be true.

'I can corroborate my old friend's words,' said James Haworth, smiling. 'Of slate in especial, as having for six months managed Lord Treverney's quarries in Glamorganshire, I do know something. We have just found slate of very fine quality on Leonard's land at Pen Madrin. If the foxes the place takes its name from are not scared before long by the din of mattock and shovel, I am not worth my salt as a civil engineer. My firm—Sterling, Bowlderby, and Co., at your service—would lease the place to-morrow at a clear two thousand, and make a good thing of the bargain too.'

('I knew,' said Haworth afterwards, confidentially to Mrs Irwine, 'that there was a lady in the case; for I assure you that my old school-fellow was as indifferent to the discovery that has turned him from a briefless barrister into a well-to-do land-owner, as if he had been like some savages, unaware of the value of money. I can understand him better now.')

Annie, with mingled feelings of gratitude and admiration, extended her hand to Sir Albert: 'I hope, I do hope that you will always be my friend. I can never, to my dying day, forget how good and generous you have been.'

Sir Albert had never liked the girl better, nor she him one half so well, as now that he had given her up. But the plunge had been taken, the renunciation made and accepted, and all that remained for the baronet was to make the best of the situation. He had acted well, and felt more contented with himself than he had done of late. Ever since the avowal which Annie had made in the tunnel, her affianced suitor had been graver and more pensive than was usual with him. The spoiled child of fortune, who knew little of self-denial, and with whom the wish for a fine horse, a good picture, or a bit of coveted land had generally been gratified without serious opposition, had for the first time begun to doubt as to whether he were not selfish in holding Annie Irwine to her word. But, save for Leonard's accident, he might have married her, with the doubt still unsolved.

Arrived at Tremadoc, medical attendance was found for Leonard, and satisfactory intelligence was received concerning the capture of the runaway mare. The civil engineer had missed his train; but another was to start three hours later; and he willingly agreed to be introduced to old Mr Irwine—who was overjoyed at hearing that Leonard, always his favourite, was now in a position to become his son-in-law—and to spend the time in that sorry lodging which had been Annie's abode since leaving the vicarage.

This was by no means the last time that Mr Haworth was seen in Tremadoc; for, at Sir Albert's instance, the task of rebuilding the tunnel was intrusted to the well-famed firm of which he

was a junior partner; and under his inspection the work has since turned out a brilliant commercial success, adding largely to the value of the baronet's mines and works, and developing as much as the most sanguine could desire the resources of the district. The slate-quarry too has turned out so well that, save in his duties as a county magistrate, should his name presently figure in the Commission of the Peace, Leonard Merton can afford to leave his law-books undisturbed.

Pen Madrin, hitherto a pretty cottage, is being enlarged into a substantial family residence, since Leonard has insisted that when Annie and he are married in the picturesque church of Tremadoc, Mr and Mrs Irwine are to share his home. And there is talk of Sir Albert's wedding being celebrated at the same place and time, since the baronet, who proved fortunately consolable, has during his sojourn in London persuaded a young lady of rank and beauty to sign herself in future as Lady Flora Atwood.

THE SAYINGS OF CHILDREN.

THE popularity of Helen's Babies, Budge and Toddie, has proved to a demonstration the great interest taken in children; and when we consider that they form so large a proportion of our population and are to be found in most households, this is scarcely to be wondered at. A collection of the *Sayings and Doings of Children* has been recently made by the Rev. J. Byington Smith, and from that work and two or three other sources we derive the following examples.

As Mr Smith remarks: 'Children are embryo philosophers. As the tiny plant foreshadows the flower of the garden or the tree of the forest, so the child foreshadows the man, and the early developments of the mind indicate the latent philosophical capabilities.' A little boy once stood gazing thoughtfully into the sky, and upon his father inquiring what he was looking for, was found philosophising on 'how God got him down here when he was made up in the sky.'—A little girl was also puzzling herself about her transference from heaven to this mundane sphere, and questioned her mother: 'Did God and the angels have a funeral when I came away?'

'I presume there was no funeral,' said the mother.

'Well,' said the child, 'I presume they all felt bad.'

A little girl who had fallen out of bed, said at first: 'It was because I slept too near the place where I got in.' Then correcting herself, she said: 'No; it was because I slept too near the place where I fell out!'

A little boy was asked if he had a good memory. 'No,' said he; 'but I have a good forgetency.'

A shrewd little fellow lived with an uncle who barely afforded him the necessaries of life. One day the two were out together, and saw a very thin greyhound, and the man asked his nephew what made the dog so poor.

'I expect,' replied the boy, 'he lives with his uncle.'

A little boy running along, caught his toe in something, and fell on the pavement.

'Never mind, my little fellow; it won't hurt to-morrow,' said a by-stander.

To which the boy replied: 'Then I won't cry to-morrow.'

A mother was telling her 'little hopeful' among other things of the leopard that cannot 'change its spots;' he, however, insisted to the contrary, declaring that 'when it is tired of one spot it can change to another.'

A little girl found a shellless egg under the currant bushes in the garden, and in a high state of excitement brought it and shewed it to her aunt. 'See, auntie,' said she, 'what I found under the currant bushes! And I know the old hen that laid it. I'm just going to put it back in the nest and make her finish it!'

A friend of the writer who resides in a hilly district, was one day not long ago walking out with her little nephew, a child of seven. They observed a strong little pony drawing its load vigorously and quickly up an incline. At length Harry asked: 'How is it, auntie, that ponies can go faster than horses?' Then he paused a moment, and answered himself: 'I think I know—they haven't so much of themselves to carry.'

Another friend very recently overheard the following dialogue, the speakers being her little daughter Maggie, about four years old, and her little son Wilfred, two and a half. Master Wilfred had nervously requested his sister to go with him into another room for some purpose; the room in question being at the time unoccupied. This proposition not meeting with Miss Maggie's approval, as she was just then otherwise engaged, she promptly said: 'There are no lions there, and there are no tigers there; go yourself, Wilfred. And besides,' she added, 'you will not be by yourself; Jesus Christ will be there.'

'Will he?' queried little Wilfred; and apparently satisfied, he went alone on his expedition.

A talkative girl often annoyed her mother by making remarks about visitors that came to the house. On one occasion, a gentleman was expected whose nose had been by some accident flattened nearly to his face. The mother cautioned her child beforehand to say nothing about this peculiarity. Imagine her consternation when the little one exclaimed in the gentleman's presence: 'Ma! you told me not to say anything about Mr Smith's nose; why, he hasn't got any!'

The confidence a child has in what is said by its parents is well illustrated in the following. A little boy disputing with his sister, argued his point in this way: 'It is true, for ma says so. And if ma says so, it is so, even if it ain't so!'

The following is an instance of a kind of drollery one would scarcely expect in a very little child. The writer has a brother who stands not far from six feet 'in his stockings;' and as he is a well-built man, the said hose, knitted of good thick wool, for winter wear, are rather immense articles. This 'big brother' has two little girls, one named Ethel, the other Nellie—still called Baby—two years old. One day a short time ago, mamma

having occasion to visit the kitchen, Miss Ethel, who was with her, must needs go too; and what should she spy but her papa's stockings hanging up to dry. Turning her eyes upon her mamma with a most comical expression in them, she said: 'Are those Baby's little socks, mainma?'

To Dean Ramsay's *Reminiscences* we are indebted for the following: 'A wretched woman who used to traverse the country as a beggar or tramp, left a poor half-starved little girl by the roadside near the house of one of my friends. Always ready to assist the unfortunate, they took charge of the child; and as she grew a little older, they began to give her some education, and taught her to read. She soon made some progress in reading the Bible, and her native odd humour began soon to shew itself. On reading the passage which began, "Then David arose," &c., the child stopped and looked up knowingly to say: "I ken wha that was;" and on being asked what she could mean, she confidently said: "That's David Rowse the ploughman."

'And again reading the passage where the words occur, "He took Paul's girdle," the child said with much confidence: "I ken what he took that for;" and on being asked to explain, replied at once: "To bake his bannocks on"—girdle being in the north the name for the iron plate hung over the fire for making oat-cakes or bannocks.'

The Dean also relates another excellent story of 'quaint child-humour.' A girl of eight years of age was taken by her grandmother to church. The parish minister was not only a long preacher, but as the custom was, delivered two sermons, without any interval, on the Sabbath-day, and thus saved the parishioners a second journey to church. Elizabeth was sufficiently wearied before the close of the first discourse; but when, after singing and prayer, the good minister opened the Bible, read a second text, and prepared to give a second sermon, the young girl being both tired and hungry, lost all patience, and cried out to her grandmother, to the no small amusement of those who were so near as to hear her: 'Come awa, granny, and gang hame; this is lang grace and nae meat!'

A most amusing account of child-humour is told of a little boy who was much spoiled by indulgence. In fact the parents were scarcely able to refuse him anything he demanded. On one occasion when some dinner-guests were assembled, he was permitted to come into the drawing-room—provided he promised to behave himself. He was dressed out in a new suit of clothes—which included a pair of yellow nankin pantaloons. Dinner was in due time announced; and on being ordered up to the nursery, he insisted on going down to dinner with the company. His mother was for refusal, but the child persevered, and kept saying: 'If I don't go, I'll tell *yon*;' which being interpreted means: 'I will tell something you might not like to hear.' His father then for peace-sake let him accompany the guests to the dining-room, where he sat at table by his mother. When he found every one getting soup and himself omitted, he demanded some, and repeated: 'If I don't get it, I'll tell *yon*.' Well, soup was given, and various other things yielded to his importunities, to which he always added the usual threat of 'telling *yon*.' At last, when it came to wine, his mother stood firm,

and positively refused, as 'a bad thing for little boys,' and so on. He then became more vociferous than ever about 'telling you,' and as still he was refused, he declared: 'Now, I will tell you,' and to the inexpressible confusion of his much-enduring parents, and the irrepressible amusement of the assembled guests, roared out: 'My new trousers were made out o' mother's old window-blinds!'

Dean Ramsay mentions a little boy who must have had a very unlovable father, for when he was told of heaven, he put the question: 'An' will faather be there?' And on his instructress answering that 'Of course she hoped he would be there,' the child at once sturdily replied: 'Then I'll no gang.'

But though generally candid and open, children, like those 'of larger growth,' will often put the best face upon facts concerning themselves. A little Scotch boy who attended a day-school was always asked, when he came home in the evening, how he stood in his own class. His invariable answer was: 'I'm second dux,' which means in Scottish academical language, next to the top of the class. As his habits of application at home seemed scarcely to warrant such a position at school, one of the family at length ventured to ask of what number of pupils the class consisted. After some hesitation, the little fellow replied: 'On, there's jist me and anither lass.'

Little children have often very tender consciences, and are perfectly aware when they have been 'naughty.'

A little girl one day said to her mother: 'Papa calls me good, auntie calls me good, and everybody calls me good; but I am not good.'

'I am very sorry,' said the mother.

'And so am I,' said the child; 'but I have got a very naughty *think*.'

'A naughty what?'

'My *think* is naughty inside of me.'

And on her mother inquiring what she meant, she said: 'Why, when I could not ridle yesterday, I did not cry nor anything; but when you was gone, I wished the carriage would turn over, and the horses would run away, and everything bad. Nobody knew it; but God knew it, and He cannot call me good. Tell me, mamma, how can I be good *inside* of me?'

A little fellow four years old prayed thus for himself: 'O Lord, bless George, and make him a good boy; and don't let him be naughty again, never no never! Because you know when he is naughty, he *sticks* to it so.'

Children will sometimes add to their usual prayers petitions for something they particularly desire. A very little boy, who lived with his aunt, had been often told by her of the fine time coming, when he should be big enough to go to school and carry his dinner in a little basket on his arm. One night, when he had finished 'Now I lay me down to sleep,' &c., Eddie asked his aunt to teach him the 'big prayer.' She accordingly said 'Our Father' for him, stopping very often, that he might repeat it. When she said: 'Give us, this day, our daily bread;' Eddie drawled out, half asleep: 'Give us, 'is day, our daily bread, and a b-a-s-t-e-t too!'

Finally, another little fellow, who like many children, found his boots a very troublesome part

of his toilet, prayed: 'O God, bless father and mother, and sister Nanny, and please make my boots go on easy.'

GENEROSITY AMONGST CONVICTS.

WE have all heard of honour among thieves; but the present writer has just witnessed an exhibition of generosity on the part of a convict which acted on his moral nature as a refreshing tonic. The assizes are going on at the town where I write, and to-day, having nothing better to do, I sauntered into court to hear the learned summing up of judges, and routine of court-practice generally. The charge that was being tried was one of insubordination at Spike Island Convict Prison against two convicts, called respectively James Kirk and Daniel Bartley. They were charged with wounding a warder, by name John Condon. The prisoners pleaded not guilty, and conducted their own case. And very well they did it for the most part, though a few questions were asked by them when cross-examining, which made their cause appear worse rather than better. Several convicts had been brought up on the previous evening from their prison to give evidence. It was certainly a rather unusual sight to see over a dozen men dressed in ugly frieze jackets, on the arms of which were marked their prison number, length of sentence, and other mysterious signs—to see these one after another ascending the stand as witnesses to be examined, not by barristers, but by two of their brother-convicts standing in the dock. There they sat, looking round the court with eager cunning eyes, as though they could never see enough in the short time during which they were allowed to leave their prison. What a chance it was for men sentenced to five, seven, and eight years' penal servitude to lay up food for thought that would relieve the torture of dark cells and the silent system!

The witnesses one could easily see were genuine specimens of the criminal class. People become very expert phrenologists when looking at the 'dangerous classes.' It is easy to read in the faces of those who wear a prison garb and have their hair cropped, all sorts of deadly sin. 'What a murderous eye!' we think. 'Here surely goes a cunning forger.' 'How terribly developed is the bump of destruction in the case of Ps. 15962!' Another reflection was forcibly suggested by this rather unique trial. It was this—that Englishmen ought indeed to be proud of the majesty of their equal laws, which give even to convicted men not merely justice, but the greatest amount of consideration. These two convicts were being prosecuted for an assault committed when they were in prison; but had they been sons of the Queen herself, dressed in broad-cloth instead of in prison frieze, they could not have had a more patient trial. The judge in a courteous manner gave them all the assistance he could, and they were allowed to examine and cross-examine as many warders and fellow-prisoners as they chose.

The prisoner Bartley then addressed the jury with considerable ability, complaining of having been ill-treated, and appealing for justice. Kirk also addressed the jury, but confined himself to the evidence. The jury, without leaving the box, found Kirk guilty of common assault, and Bartley

guilty of assault, occasioning actual bodily harm. His lordship then sentenced Kirk to be imprisoned for six calendar months, and kept to hard labour, to commence at the expiration of his present sentence; and Bartley, who appeared to have been far the worse of the two, to be imprisoned for eighteen calendar months. And now the circumstance occurred, to describe which is the object of this paper. No sooner had the judge pronounced his sentence than the voice of the prisoner Kirk was heard making a most generous proposal in reference to his companion in crime.

Kirk. Give me the same, my lord.

The Judge. No; I will not.

Kirk. I have been the cause of bringing him into it; only for me, he would not have done anything at all. Give him the six months, and I will take the eighteen.

Judge. That I cannot do; but as you desire it, I will take, for you, six months off Bartley's sentence, and only give him twelve.

There was considerable applause in court at this settlement of affairs between his lordship on the bench and one of the prisoners at the bar. And no wonder, for it is seldom that a judge is called upon to refuse to a prisoner a longer term of punishment than justice demands, at the self-sacrificing suggestion of the prisoner himself. It would indeed have been difficult to refuse our mite of admiration to poor Kirk as we heard him saying in an impulsive manner: 'I have been the cause of bringing him into it; only for me, he would not have done anything at all. Give him the six months, and I will take the eighteen.' 'There is,' according to Shakspeare, 'some soul of goodness in things evil, would men observingly distil it out;' and here, I thought, as I heard Kirk plead for his friend against himself, is a manifest example of the principle. Prisoner Kirk was in the yes of ordinary people a villain of the blackest hue, and yet he proved himself capable of an act of generosity concerning which most of us unconvicted persons in court would have thought twice before doing. Pharisaic self-righteousness can with difficulty believe anything good of those who have had the misfortune of being caught and imprisoned. On the other hand, a person who is guilty of even hateful vices need never despair of being considered 'respectable,' if only he be cunning enough to escape detection, or rich enough to purchase impunity.

The incident, that has been related as it was lately heard by the present writer, proves that a convict is not of necessity wholly bad. It illustrates the fact, that in the case of even the worst and most dangerous characters there are latent sparks of goodness which only require the breath of sympathy and confidence to fan into a generous glow.

I'll no say men are villains a';

The real, hardened wicked,

Wha hae nae check but human law,

Are to a few restricted.

Those who have allowed themselves to be influenced by the spirit of Him who was called the 'Sinner's Friend'—these 'magnets for discovering virtue' find such a large mixture of goodness in things evil that they cannot be cynical. And in cases where the dark cloud of sin and crime seems to have no silver lining, 'what's done,' they

say, 'we partly may compute, but know not what's rewarded.'

An old and beautiful Eastern apologue occurred to my mind as I left the court where I had learned to believe more in imprisoned human nature. 'Jesus,' says the story, 'arrived one evening at the gates of a certain city; and he sent his disciples forward to prepare supper, while he himself, intent on doing good, walked through the streets into the market-place. And he saw at the corner of the market, some people gathered together looking at some object on the ground; and he drew near to see what it might be. It was a dead dog with a halter round his neck, by which he appeared to have been dragged through the dirt; and a viler, a more abject, a more unclean thing never met the eyes of man. And those who stood by looked on with abhorrence.

"Faugh!" said one, stopping his nose; "it pollutes the air!" "How long," said another, "shall this foul beast offend our sight?" "Look at his torn hide," said a third; "one could not even cut a shoe out of it." "And his ears," said a fourth, "all dragged and bleeding." "No doubt," said a fifth, "he has been hanged for thieving."

'And Jesus heard them, and looking down compassionately on the dead creature, he said: "Pearls are not equal to the whiteness of his teeth."

'Then the people turned to him with amazement, and said among themselves: "Who is this? This must be Jesus of Nazareth; for only he could find something to pity and approve even in a dead dog." And being ashamed, they bowed their heads before him, and went each on his way.'

Prisoner Kirk had undoubtedly been 'dragged through the dirt' during his life of crime; but I could not help repeating to myself, as he stood pleading for his friend Bartley, and asking to be allowed to bear his punishment: 'Underneath a prison jacket a heart has throbbed at least one generous impulse, compared to which pearls are valueless.'

LONDON DOG-STEALERS.

AMONG the depraved lower classes in the metropolis there are men, and women too, who carry on a regular trade of stealing dogs; and in this they are very proficient. They are ever on the watch to pick up dogs that happen to be strolling out with their masters or mistresses. They note the dwellings where dogs are kept, and lay all sorts of plans to capture and carry them off. Small spaniels or terriers, usually known as toy-dogs, and which in a sense are the happiness of households, are specially watched for. We have known the case of a pretty little dog of this class that was stolen again and again, although carefully looked after, as it was thought; and was recovered by its disconsolate master and mistress only at considerable expense. How it was taken away appeared to be incomprehensible. At length it was ascertained that it was caught up, put into a milk-pan, and carried off by the person who supplied the house with milk—one of the servants of the establishment probably facilitating the larceny. Some years ago, the law against dog-stealing was increased in severity; nevertheless, dogs continue to be stolen in considerable numbers, and much heavier penalties for the offence would

need to be enforced. To our apprehension, the stealing of an attached pet-dog is a crime only short of child-stealing, and we should be glad to see it visited at least with penal servitude, as a terror to the scoundrels who habitually perpetrate this atrocious outrage.

Meanwhile, we are delighted to see that at the Middlesex May Sessions, before Mr P. H. Edlin, Q. C., the Assistant-Judge, and a number of Justices, a proper spirit was shewn in the matter of repressing dog-stealing. As the case is curious, instructive, and in its issue peculiarly gratifying, we copy the report of it entire from *The Times*.

Charles Burdett, forty, was indicted for having stolen a dog the property of Henry Layton, and a dog the property of Thomas Phillips; and also for having unlawfully and corruptly taken money of Edward Freeman upon account of aiding him to recover a dog which was in the possession of a person not being the owner. Mr Kelly appeared for the prosecution; Mr Ribton for the defence. The prisoner pleaded "Guilty." Mr Kelly said that, as his Lordship was aware, the prisoner had already been convicted of dog-stealing; but a short statement of the circumstances in which Burdett was now before the court might not prove uninteresting. At about two o'clock on the morning of the 26th of April, Mr Abberline, an inspector of the metropolitan police, observed the prisoner walking in Shoreditch with a bulldog, which Burdett said was his own. The inspector, not believing this story, arrested the prisoner, and found on him a piece of prepared liver, such as is used by dog-stealers to entice the animals. The bulldog turned out to be the property of Mr Layton. It was a very valuable prize animal, and was safe in Mr Layton's yard at Finsbury on the night of the 25th April. On a search of the house in which the prisoner lived, several dogs were found there, and among them a little toy-terrier, the property of Mr Phillips, of Wilton Place, which Burdett became possessed of by an ingenious subterfuge. Emma Bowles, a servant in the employment of Mr Phillips, was with her master's dog in Hyde Park on the 25th of April. The little dog was disporting itself by rolling over in the grass, when the prisoner informed Bowles that it was in a fit, and it was necessary to give it water. He administered the water, and then suggested that it would bite her if he handed it back, and that the best course for him to adopt would be to take it to her master's house. She gave him the name and address of Mr Phillips; but the prisoner, instead of going there, carried off the dog to his own place at Shoreditch. In the case of the third dog, which was a collie, belonging to Mr G. Seymour Fitzgerald, of Queen's Gate, Kensington, Freeman, a groom, was exercising one of Mr Fitzgerald's horses on the 6th of November last. He was followed by the dog, which he suddenly missed. On the 12th of the same month an advertisement was inserted in *The Times* offering a reward of two pounds for the recovery of the collie. On the 15th the prisoner went to Mr Fitzgerald's stables and told Freeman that he knew a person who had bought the collie at the cattle-market, but who, although he had a customer for the animal at Brighton, was willing to give it up to the owner for the sum he had paid for it. At Burdett's request, Freeman accompanied him to a

public-house in Holywell Lane, Shoreditch. Here a woman appeared on the scene, and said that her father had paid three pounds for the dog; but on the representation of the prisoner that Freeman was only a servant, the woman ultimately restored the dog for two pounds. Other stolen dogs, which had since been recognised by their owners, were found at the prisoner's house; and there could be no doubt that he was a persistent and systematic dog-stealer. Mr Ribton, addressing the court in mitigation, suggested that motives of humanity might have prompted the action of the prisoner in respect of the toy-terrier. The Assistant-Judge said that the law did not allow the Bench to give the prisoner penal servitude, though he had been previously convicted of dog-stealing. The sentence was that he be imprisoned and kept to hard labour for eight months on each of the three charges in the present indictment, which would for all three be two years' imprisonment with hard labour.

Two years with hard labour is not bad as a visitation of justice. We trust that this very just punishment will have a salutary effect in repressing the system of dog-stealing in London. All honour to Mr Edlin and other members of the Bench for their fortitude in applying the law in a matter which so intimately concerns the feelings of the community.

W. C.

THE OLD OAK-TREE.

I LOVE the woods arrayed in Summer's green,
Or tinged with russet Autumn's golden sheen;
In pensive mood I gladly seek their shade,
And ramble through each leafy glen and glade.
But yet, how'er the forest may delight,
The opening plain brings still a welcome sight.
No denser spot the landscape holds for me
Than that white-gowan'd, spacious grassy lea
Where stands in solitude, the old oak-tree!

In bygone days, how often here I've staid,
And lovingly thy giant form survey'd;
Returning now from lands I long have ranged,
I come in age and find thee all unchanged.
'Tis truly writ that life is but a span,
At least that portion which belongs to man;
For but as yesterday it seems to be
When, still a boy, I cut my name with glee
Deep in thy rugged bark, d at old oak-tree!

In young manhood three staunch friends were wont
From time to time to seek this cherished haunt;
Each took his chosen path the world to roam,
With hopes to meet in after-days at home.
Alas! ere many years had fled o'er,
One sunk to rest on far Arabia's shore;
The next found sailor-grave in tropic sea;
While I am left alone of all the three
To keep the tryst beside the old oak-tree!

How still the air around this regal oak
The yet my voice the charmed silence broke;
Till now unheard, the drowsy feathered throng
Awake to pipe with joy their evening song;
The daisy closes with a glance of love;
The dark'ning shades surround the mystic grove.
Oh! when the Fates send forth their dread decree,
That bids the day no longer break for me,
May sunset find me 'neath the old oak-tree!

THE FRENCH-CANADIANS OF TO-DAY.

SAILING up the great St Lawrence from the mighty Gulf which bears its name, as the rolling plane of water narrows and the banks appear on each side, the traveller is struck by the appearance of dreary lifelessness which characterises the groups of houses or sparsely settled villages which at intervals gleam whitely through the sombre shadow of dense pine-woods. Remote from towns or any centres of civilisation, simple and peaceful as the inhabitants of Acadia, but alas! minus their practical prosperity where there is nothing to be bought, even if they possessed the money necessary for purchasing, which they do not—these people may be said to live almost entirely within themselves. The houses of the peasantry are as a rule built of wood; sometimes of logs laid upon each other, having their interstices filled with mortar, which renders them almost impervious to the cold of winter; though more frequently they are composed of a shell of boards, upon which is nailed in sheets the inner bark of the birch-tree. This again is covered with clap-boards or planks lapping one over the other from the ground to the eaves. The main idea in building is warmth, on account of the severity of winter; and this double wall as it were, lined with the closely fibred birch-bark, renders the houses much more comfortable than might at first be supposed.

As a rule, the French-Canadian village is more picturesque, as are also the inhabitants, than those of the English-speaking populations of Western Canada and the United States. The houses, though low-roofed, have an air of comfort and a long-settled appearance which is conspicuous from its absence in the hamlets of the west. The curved roofs project several feet beyond the walls, and this of itself is to the eye a great improvement on the square, box-like structure which usually satisfies the methodical mind of the rustic of English or Scottish descent. Instead of innumerable black tree-stumps which by their ugliness deform more newly settled districts, trees and

shrubs lend a beauty to the landscape; which, moreover, has the advantage over Western scenery of being diversified by hill and valley. The houses are generally whitewashed or painted; and thus a French-Canadian village, or even farm-steading with out-buildings, has a charming air of cleanliness and neatness.

Nor do the interiors belie the exteriors. There everything is characterised by an exquisite purity. Floor, tables, wooden benches and chairs, in the kitchen or common living-room—all have arrived at a state of brilliant whiteness which hearty scouring alone can command. The great cooking-stove, supported on legs nearly a foot high, is half through the partition into the next room, for a square opening to admit it has been made. This has been polished, until it has likewise arrived at a condition of brightness very nearly resembling perfection. Upon the floor, at intervals, thus lending an air of comfort to the room, are placed oval mats and strips of rag-carpet. This carpet is quite an institution among the *habitants*, and is made by the women of the household after their other work is finished. It is composed of narrow strips of all colours, which are sewn together, and then woven in a rude sort of loom. Against the walls hang gaudy pictures of the Madonna and Child, the favourite or patron saints of the family, and generally a representation of the reigning Pope, for whom, as in duty bound, they entertain feelings of profound veneration. About the frames of these pictures is twined the graceful ground-pine; while in the corners of the room branches of pine and spruce are fastened against the wall. These, to the uninitiated, might appear to be solely for ornament; but such is not the case—they have a much deeper significance. The common house-fly, though harmless enough in itself, becomes to the householder throughout the summer, when augmented by millions of its kind, a source of great nuisance. This troublesome insect entertains, it would seem, a strong repugnance to the odour of these trees, and hence the custom, which at first appears singular to the

traveller. The culture of home-plants enters largely into the economy of the French-Canadians. In the windows of almost every house, no matter how mean, are to be seen throughout the long and bitter winter, such flowers as monthly roses, fuchsias, carnations, begonias, in full bloom.

The bedrooms of the houses exhibit as a rule no less careful attention than those into which visitors are ushered. Here is to be found more rag-carpet, more highly coloured saints, and generally a little common crucifix and holy-water font hanging against the wall. Upon the bed is spread a patched counterpane, formed of wonderful combinations of calico in every shade and pattern. These are replaced on extraordinary occasions, in the houses of well-to-do *habitants*, by counterpanes of white cotton, upon which are sewn in crimson, green, and orange the most impossible figures, selected apparently from the animal and vegetable kingdoms. It is a curious feature with many of the poorer French, even in the cities, that the gaudily caparisoned beds are kept only for ornament, and that the members of the family leave these much and gorgeously adorned articles of furniture entirely unoccupied, invariably sleeping on the hard floor, and covered only by a blanket or buffalo robe. In winter-time the stove oven, in the absence of fire-places, affords a comfortable retreat for the feet. Small as the houses are—and among their various economies that of room is not the least—these householders manage to stow away a considerable number of people. Marrying as they do often when little more than children, it is not surprising that they have very numerous families, eighteen and even twenty not being considered anything very unusual.

In all parts of the country where Indians are to be found they are on the most amicable terms with the French-Canadians, and many intermarriages occur between them. Almost all the tribes which have become Christianised have embraced the Roman Catholic faith, but this is of course rather an effect than cause of their intimacy. At the present time the guides, trappers, and buffalo-hunters of forest and prairie, half Indian, half French-Canadian, are the true descendants of those hardy men who were the pioneers of the fur-trade in that wide stretch of country which is washed by northern seas and hemmed in by a vast mountain-range. They possess extraordinary powers of endurance, and are able to undergo any amount of fatigue. But as civilisation advances towards the great North-west, this class, like the game they hunt, must gradually disappear, for they are of too volatile a nature ever to settle down in farm or workshop. As a picturesque figure—as a gay rover of forest and river and prairie, the half-breed or *métis* of the Red River, of the Assiniboine, and of the Saskatchewan must soon fade away into history and romance, like his old prototype the *coursur du bois*.

Since the occupation of hunting fur-bearing animals has in a great measure gone from them, the French-Canadians have turned their attention to that of timber-felling, or 'lumbering' as it is called in America. In the autumn the lumberers are collected in the great centres for this work—the Gatineau, the Désert, the St Maurice, and the Ottawa; and there for six or seven months during the long and bitter winter, they labour, felling the mighty pines with dexterous arm. Working

together in such numbers and for such a length of time, with no women or other softening influences, the men have rough times. Their houses are built of great unsquared logs, often with the bark left upon them, and have holes cut in the roofs for chimneys. Their rations, provided by the employers, are cooked by different individuals in turn, and consist of salt pork, bread, and molasses, with diluted high wines and tea by way of beverage. During the evenings they amuse themselves with reading, singing, or playing cards; but the life is monotonous, and has not even the spice of danger as formerly, for the work is now conducted with care. In the spring, the 'shanties' (from *chantier*, a log-house) are deserted, and as the streams and rivers thaw, the great 'drive' of logs commences. As long as the lakes and rivers are smooth, this is not difficult to manage; but there are many impetuous falls and foaming rapids to pass ere the great rafts reach their destination, and men of keen eye, skilful arm, and daring heart are needed to guide them aright. It is a fine sight to see one of these great rafts sweeping down the Ottawa on its course to the St Lawrence, with the men grasping their long oars, ready for any emergency. Log-houses are built upon the rafts for the accommodation of the drivers, and the smoke issuing from their chimneys, and the clothes-lines on which red flannel shirts and other articles are capering in the wind, look very picturesque—from the shore. Of course all nationalities of the people of Canada are employed in the lumber-trade, but the majority is made up of French-Canadians.

The greatest possible contrast exists between those who cannot be induced to stay at home and those who remain from choice on the farms, and cultivate the land to the best of their ability. They possess few modern agricultural implements, and cling tenaciously to the old-fashioned methods of farming. Men, women, and children throughout the summer months are busily employed sowing, reaping, and garnering their scanty crops and stock of vegetables. Tobacco also is cultivated by almost all the *habitants* for home consumption, and the plant may be seen rearing its broad leaves and delicate pink flowers beside almost every cottage; for the male portion of the community are from childhood inveterate smokers. During the long winter days, when the dark river is fast bound in ice, when bitter winds howl about their dwellings, and roads are rendered impassable by immense drifts of snow, the women employ themselves in spinning, dyeing, and weaving the wool from which their garments are made.

Farmers who live in the vicinity of towns and cities devote their time to the cultivation of vegetables and fruits necessary for market supplies. These on market-days are frequently intrusted to the women, who sit enthroned among their farm-produce, and guide the rickety wagons to the nearest town. Arrived there, they either quickly dispose of their goods to the stall-keepers, or, which is more profitable, hobble their horses, and themselves await customers, who find it more economical to purchase direct from the country-people. These market-days without exception comprise the happiest moments of a French-Canadian woman's life, for at no time is she more in her element. Everywhere are evidences

of bounteous harvest—vegetables of every kind in abundance, huge golden pumpkins, and melons with delicate gray tracery over a pale green rind. Great baskets of ruddy tomatoes, and piles of Indian corn with its shaded brown and green silk tassels. Apples of many kinds, pears, peaches, regal plums, rosy and pale golden crab-apples, and huge baskets of small purple wild-grapes. Besides the foregoing produce, and surrounded by great blocks of clear blue ice, there are bottles of thick rich cream for sale; and yellow butter, which is well and carefully made, in dainty pats. Nor are these by any means all the articles which French-Canadian farmers and their wives send to market. All sorts of home-made clothing, woollen comforters and socks, sausages and wooden shoes, maple-sugar, wild-fruit in its season, hats with queer conical or broad crowns and immense spreading brims, made of coarse straw plaited by the women and children—all these and many more things have their part in the conglomeration. Chattering, laughing, scolding, haggling, so passes the day, until stock is sold out, or the westering sun begins to cast lengthening shadows. Then nosebags are removed from horses' mouths, unsold vegetables gathered up and replaced in the wagons, and the busy scene becomes deserted.

Both men and women of the French-Canadians are as a rule short of stature, and have swarthy complexions, and black eyes and hair; though in some parts of the country the traveller finds families and even whole villages of persons with fair skin, blue eyes, and light brown or red hair. The women are seldom pretty, though almost always bright and animated-looking. They age rapidly, and though slight in youth, become in middle age stout and shapeless. As young people, both sexes are fond of wearing gay clothing; the young men confining their attention to bright neckties, silver finger-rings and other jewellery, and being greatly addicted to high taper-heeled boots; while the women endeavour to follow the goddess Fashion as closely as possible, in cheap and gaudy materials.

It is difficult to say in what manner they amuse themselves, unless it be simply in dancing, singing, and talking. Strange to say, the French-Canadians have lost much of the wit and *espièglerie* of their ancestors; though that, in their opinion, does not constitute a sufficient reason for preserving silence. On the contrary, they are always chattering, and do not, apparently, have any false delicacy about private concerns; for their opinions are delivered in the street, in the market, wherever they may be, with great loudness and volubility, accompanied with unlimited shrugs and other gesticulations. The *habitants* delight in singing ballads or *chansons*, which have long been in vogue among them. These ballads are essentially characteristic of people conservative of old customs and traditions, and are the same in spirit, and often in words, as those their ancestors brought from Bretagne and Normandy, and which were sung in the days of the first settlers. Some have been adapted to Canadian life and scenery; but the majority are European in sentiment and expression. The French-Canadian lumberer, as he swings his axe in the depths of the pine-woods, still sings snatches of songs, which even now can be heard at Norman, Breton, and Provençal festivals. Among many others which are sung by all classes

of people, one of the most popular from Gaspé to the Red River is *En roulant ma Boule*. It is particularly adapted to be sung during rapid motion, as that of the sleigh with its chime of bells, or the light birch-bark canoe shooting over rapid rivers. There are many versions of this gay and lively melody, shewing clearly that there is no doubt as to its popularity in all parts of the country. There is however, in all the French-Canadian songs, much *répétition*, which cannot be properly translated into English.

Frugal, industrious, hospitable, light of heart, these people are also imbued with deep religious feeling. Nor is this confined to the women alone, as is often the case in France; on the contrary, the men are assiduous in rendering obedience to the many rules of their Church. So much so indeed, that those spiritual fathers who in the course of missionary tours have made Canada a field of labour, express much satisfaction at the condition of religious affairs.

Thus in an imperfect and unfinished manner has the writer endeavoured to give his observations of the manners and customs, in public and in private life, of the French-Canadian people. Immigrants originally from *La belle France*, and spreading as they are throughout the great Dominion of Canada, it is a pity that in spite of many excellent qualities, they, with certain brilliant exceptions, do not possess more independent habits. Much could be written upon this subject which would doubtless interest the reader, and yet comparatively little can be accomplished in the way of improvement so long as they calmly submit to being thought for instead of thinking, and being led, in place of valiantly striking out in a new path for themselves. Without doubt, the French-Canadian peasantry might be much worse, as they might also be better, citizens than they now are; but to what nation might not such words be truthfully applied! It is more than probable that as educational institutions spring up in a country whose magnificent resources are yearly becoming more developed, this class of people cannot fail to improve, and may ultimately achieve great success in all branches of mercantile labour.

YOUNG LORD PENRITH.

CHAPTER XII.—THE OLD SHAFT.

It is dreary enough, on a winter's evening, to be overtaken by the darkness, far from home, even when the road is one that we know well, and the district perfectly familiar. But Sir Lucius, stumbling on through the chilly rain and thick mist, in a rugged and stony ravine, down which the mill-stream, swollen by recent wet weather, made its way with sullen roar, bitterly lamented the inadvertence which had caused him to be alone after dark in such a spot. Had he but brought with him the boy who had on a previous occasion guided him to the Mawth Mill, or some similar boy, there would have been little risk of missing the track. As it was, however, he found it hard indeed to keep to the narrow and ill-defined path, and looked around more than once for some light, from cottage door or farm-house window, by

which he might shape his course. But he saw, from the time of his leaving the Mill of Death, no signs of human habitation. The hamlet of Mawth itself, where once the serfs of the Montmorts had dwelt, and where Ralph Swart's hired men resided, was in a wooded hollow nearer to the ruined castle. There were few dwellings between Pen Mawth and Tregunnow. Sir Lucius had to pick his steps as best he could among the rubbish-heaps and rotting lumber and cinders, which told where men had toiled, and ore been raised, and money spent, in the prosperous past that was, long since, a mere tradition.

Once or twice, as he threaded his difficult way among the stones and scorise and deep ruts made long ago, the baronet fancied that he heard footsteps behind him. But, when he stopped and listened, the sounds invariably ceased, and there was nothing but the moan of the low wind and the distant gurgling of the swollen mill-stream that he was leaving behind. The cold rain fell fast and faster, and he was shivering, and was glad to button his overcoat more closely around him; glad, too, to summon up such pleasant thoughts as he could muster, to counteract the depressing influences of the bad weather and the desolate landscape. How well he had come out of that business with the Black Miller! How skilfully he had played his cards, and how boldly withal. Yes, boldness was, with a ruffian of that stamp, the best policy, the best and the safest. He had a hold on Swart, or Grewler, and could count on his active aid in the removal of a hated obstacle, without compromising himself in the event of failure.

That odious fisherman fellow—that insufferable upstart who won praise and good-will, somehow—and on whose behalf Maud Stanhope was provokingly ready to speak her mind—his run of luck, surely, must be almost over. It was unendurable that the future Lord Penrith should be thwarted and—Again those stealthy footsteps! Sir Lucius turned briskly round, but he saw nothing and heard nothing. He called aloud, but there was no reply. He seemed to be alone with the gathering night and ceaseless rain.

He stumbled on, then, after a short pause, but suddenly came to a stop. Straight in front, at his very feet, yawned a blackness that was blacker than the night, and the blood ran cold in his veins as he reflected that he must have strayed from the path, and that a single step in advance would have hurled him, many a fathom deep, down the silent shaft of some deserted mine.

'Lucky I stopped when I did, precious lucky!' said the baronet, as he picked up a pebble, and tossed it down the yawning pit so near him. It was long—or to his heated imagination it seemed long—before a faint sound, as of a stone splashing into water, came feebly to his ear. Sir Lucius could not repress a shudder, but he was angry with himself because of the fear that chilled his veins. Half mechanically he thrust his hand into a side-pocket of his coat, but found no hunting-flask replete with spirituous comfort. As he did so, he thought that again he heard footsteps creep-

ing up behind him; but as he turned his face and shaded his eyes with his open hand, the better to pry into the darkness, a loose stone near him was violently displaced by the spurn of a heavy foot, and a smothered, savage imprecation made him recoil. Then the treacherous earth trembled, crumbled, and gave way beneath his shrinking feet, and with one cry for succour or for mercy, the Baronet stumbled and fell headlong into the black gulf of the abandoned mine!

The Black Miller—for he it was, as may well be guessed, who had dogged his late visitor so closely—came crouching to the very edge of the pit. His powerful right arm had been uplifted, and in the strong hand was the loaded riding-whip ready to strike; but Ralph Swart's murderous purpose had been balked by the sudden catastrophe that had removed his victim beyond his reach. With a sort of reluctance, the ruffian allowed the upraised arm to drop weightily by his side, and stooped over the brink of the shaft, listening greedily for the anticipated sound. Yes, it came at last, deep down, and muffled, the sullen splash of something heavy falling into water, and then there was silence, unbroken by moan or cry, a silence so profound and so terrible that even the hardened wretch kneeling there was in a manner constrained to break it.

Stooping perilously low, so as to throw the sound of his resonant voice down the shaft, he uttered a short exclamation, to which the gloomy pit gave back, as if in mockery, but a hollow echo. Ralph Swart did not a second time disturb the sullen profound. He rose, and taking a box of matches from his pocket, struck a light, not once, but repeatedly, and by the short-lived glimmer of each successive match, took a hasty but heedful survey of the spot.

'Nothing left about' muttered the Black Miller in grumbling accents. 'Nothing—not a glove, not a stick, not so much as a half-burnt cigar to tell tales, when the hunt begins. Ho, ho! Dead men—according to the old saw—tell no tales. But I am afraid they'll wait dinner long for Sir Lucius at Llosthuel Court this evening.' He laughed again, and chuckled, and laughed more ogreishly than before, as he stealthily picked his way among the stone-heaps; but a good judge of laughter would have set down Ralph Swart's rude mirth that night as an outburst of mere ribald bravado.

We can never, try as we may, divorce ourselves from the common ties of humanity, from the common rules of right and wrong; and even the most hardened ruffian will shew an occasional gleam of remorse when a more than usually brutal crime has been perpetrated. But the Black Miller had physically a stout heart, and he felt less, as he groped his way back to the road, than many a meaner ruffian would have done.

'The cur!' muttered Ralph Swart, as he slowly and painfully threaded a path, through fog and thickening rain, amidst the rubbish-heaps, and the unfenced mouths of abandoned mines, and the mouldering lumber—the cowardly cur, without even the courage necessary to back his selfish scheming—it served him right that he should finish thus! He must have been a dolt to come here, an idiot to threaten me! But as for Hugh—young Hugh!—and here the Black Miller changed his tone to one of involuntary respect—

'there is a man, plague him! It would be worth while, now'—As he spoke, Ralph Swart halted and drew himself up to his full height, throwing out his brawny arms like a wrestler who challenges an opponent. 'He is the younger man,' cried the Black Miller boastfully; 'but I—I never met my match!'

And very terrible this fierce, shrewd, pitiless man would have looked, had any eye pierced through the curtain of mist and darkness to see him as he stood, alone in the waste, frowning grim defiance on an imaginary foe. His vast strength, resolute countenance, and threatening attitude caused him to resemble some rough-hewn statue of a gladiator, ready to commence the struggle in a Roman arena, where blood and bone and muscle were pitted in deadly strife, amidst the clapping of soft hands, and offering of wagers, as on a modern race-course.

Then Ralph Swart's mood seemed to change, for his arms fell to his sides, and his head was bowed, and it was slouchingly, and with a clownish gait, that he regained the well-known track, and plodded upwards, along the path that bordered the roaring mill-stream, towards the Mawth Mill. It rained hard and harder; but, as often happens, the fog thinned and waned, and through a rift in the clouds the sickly moon peeped out, and threw a pale lustre on the dark keep of the ruined castle where once the Barons of Montmort dwelt, clutching what was theirs, and more, by the strong hand and the hard heart. It was a lesson lost on the unlettered peasant who passed by; but to the Black Miller it did seem to suggest ideas, for he stopped, and looked cynically at the old robber-hold of the Norman noble. 'What does Aristotle say,' he growled out, 'about the tyrant's life, in his time? The Greek slips my memory; but there could have been no great difference between a lord in Hellis and a vavasour of feudal times, save that the one had no suzerain, and the other had. Either lot would have suited me, ho, ho! either would have suited me well enough.'

As he spoke, he came in sight of the dark mass of his own mill-tower, overshadowed by crags, and was soon at his own door. He unlocked the door with the key that he carried in his pocket, went in and reclosed it, barring, bolting, and locking it, as if to stand a siege. Half an hour afterwards the flaring petroleum lamp that had stood so long on the kitchen table was extinguished, and every window of the Miller's house was dark.

(To be continued.)

PRECOCIOUS CLEVERNESS.

PRECOCIOUS cleverness is not unfrequently believed to foreshadow a career the reverse of brilliant, and is believed by many to presage an early death. The vanity and greed on the part of parents sometimes inducing them to make the most of gifts unusually developed in their children, to the overtaking of such infantile genius, may account for a belief of this nature. But many instances may nevertheless be brought forward to prove the fallibility of an assumption so unfavourable.

Such youthful prodigies as Pope, Cowley, Campbell, Montgomery, Master Betty the young Roscius, Buxton, Bidder, and the 'Learned Child of Lübeck' for instance, are doubtless familiar to our readers; but there are other examples of early

development of talent that may not be so well known. Take the case of James Ferguson, the astronomer and mechanist. He was a native of Banffshire in Scotland, and though only the son of a labourer, his extraordinary genius quickly displayed itself. He learned to read in infancy by hearing his father teach one of his brothers; and when only eight years of age he is said to have constructed a wooden clock. Employed when old enough as a farm-servant, he was sent out to keep sheep, in which humble situation he acquired, we are told, a surprising knowledge of the stars. His abilities being discovered by some neighbouring gentlemen, one of them took him to his house and taught him the rudiments of mathematics. He afterwards published some astronomical works and gave lectures in experimental philosophy, which met with great success.

Seldom are the indications of genius in youth so apparent as they were in the case of Theodore Hook. At seventeen he produced his first drama, *The Soldier's Return*, which was speedily followed by other operatic pieces, nearly all of which were successful. These with a host of piquant articles in the *Satirist* magazine and other periodicals, were hit off before his twenty-fifth year. His reputation as a man of rare accomplishments and pre-eminently convivial talents is well known.

The extraordinary precocity sometimes displayed by great musicians like Mozart may here be alluded to. Before he was eight years of age, Mendelssohn excited the wonder of his teachers by the accuracy of his ear, the strength of his memory, and above all by his incredible facility in playing music at sight. Meyerbeer at the tender age of six played at a concert, and three years later was one of the best pianists at Berlin; while the genius of Beethoven shewed itself so early that his musical education was commenced by his father, at the age of five. When two years younger than this, Samuel Wesley the musician could play extempore music on the organ; and the distinguished German musical composer, Robert Schumann, also shewed at a very early age a strong passion for music, and remarkable talents both for playing and composing. Though he lost the use of his right hand at the very outset of his studies, he worked on with a giant's strength, struggling against all obstacles 'with uncompromising devotion to what he conceived to be the highest interests of art.'

Something of the same early development of musical abilities displayed itself in the case of Cipriani Potter, distinguished as a composer and pianist; and Henrietta Sontag, a famous singer of her time, trod the boards when a child, and was prima-donna of the Berlin stage and the idol of the capital before she was eighteen. The great vocalist who has passed from our midst, Madame Tietjens, is also said to have given indications of promising musical talents from earliest infancy. Before she could speak, she would hum the opening notes of Auber's opera *Fru Diavolo*. When a toddling child, she used to create great amusement by her efforts to sing and play, and was quite content to be allowed to wander amongst the instruments of a neighbouring pianoforte manufacturer's warehouse and make music after her own fashion—music which was recognised by one at least of those who heard it as more than the strumming of a child.

A rarity even in these go-ahead days was a concert given not very long since by a pianist of five and a half years old; and therefore Mademoiselle Jeanne Douste's *matinée* at the Langham Hall had powerful attractions for those interested in musical affairs. Little Jeanne Douste, a marvel of precocity, plays with all the steadiness and confidence of a practised professional, and is free from the drawbacks which generally mark the performances of juvenile prodigies. The child-pianist's rendering of the works of composers like Haydn and Mozart is said to have been truly remarkable alike for unwavering accuracy and apparent ease of manipulation. Whether the extraordinary promise evinced by this child will be substantiated in the future, time alone can shew; at present however, her powers are wonderful, her practical skill and artistic taste being far in advance of her years.

Instances of early exhibition of great mental powers amongst British poets and authors are well known; but 'earth's sweet singers' and writers have, in other lands, not seldom given similar evidences of precocious cleverness. Metastasio, an eminent Italian poet, when only ten years of age displayed such a talent for extemporising in verse as to attract the notice of the celebrated Gravina, who took him under his protection. The young poet being thus placed in easy circumstances, devoted himself to his favourite study, and under the guidance of the celebrated singer Maria Romanina (afterwards Bulgarelli), created the modern Italian opera. The most celebrated dramatic poet of Scandinavia, Adam Oehlenschlaeger, when quite a child evinced great skill in writing verses. Even in his ninth year he wrote short comedies for private theatricals in which the child-performers were himself, his sister, and a friend. Throughout his life he displayed strong feelings and great earnestness of purpose, which gained him universal respect while he lived, and more than regal honours at his death.

John O'Keefe, a well-known dramatist, at the age of fifteen wrote a comedy in five acts. Among his early productions was a kind of histrionic monologue called *Tony Lumpkin's Rambles through Dublin*, which afforded him abundant scope for the exhibition of broad humour, and was received with applause not only in Dublin, his native city, but at the Haymarket Theatre, London. He subsequently produced nearly fifty comedies, comic operas, and farces, many of which acquired a flattering popularity.

John Payne, an American actor and dramatist, was another prodigy from childhood. He was a writer for the press, and editor of the *Thespian Mirror* when only in his thirteenth year. Three years later he appeared as Norval in *Douglas* at the Park Theatre, New York. Coming to England, he made his *début* at Drury Lane in his twenty-first year; and afterwards prepared dramas for the London stage, in most of which Charles Kemble appeared.

Painters and sculptors, as well as musicians and authors, can shew many cases of precocious cleverness in their annals. Princess Marie of Orleans, daughter of Louis-Philippe, evinced from childhood a remarkable love of the fine arts, especially of sculpture. This branch of art she cultivated with a zeal and assiduity that soon gave her a prominent place among the most distinguished

artists of her time. Her marvellous statue of Joan of Arc in the Museum of Versailles was finished before she reached her twentieth year. She also produced numerous bas-reliefs, busts, and statuettes of rare beauty and excellence.

The genius of Stevens, one of the greatest decorative artists of modern times, shewed itself at a very early age. Those who have seen the Wellington Monument in St Paul's Cathedral, after being so many years in erection, can judge what that artist's powers were in their maturity. Turner may be quoted as another example of precocity; and how the great animal painter Sir Edwin Landseer, gave early indications of his genius, may be judged when we are told that he drew animals well before he was five years old.

There are many persons who, if we are to place full credence in their biographers, must have been extraordinary marvels of precocity and cleverness. Anne Maria Schurman, for example, who was the boast of Germany, was one of this description. At the age of six, and without instruction, she cut in paper the most delicate figures; at eight, she learned in a few days to paint flowers, which, it should be added, were highly esteemed; and two years later it cost her only five hours' application to learn the art of embroidering with elegance. Her talents for higher attainments, we are told, did not develop themselves till she was twelve years of age, when they were discovered in the following manner. Her brothers were studying in the apartment where she sat, and it was noticed that whenever their memories failed in the recital of their lessons, the little girl prompted them without any previous knowledge of their tasks except what she had gained from hearing the boys con them over. In her education she made extraordinary progress, and is said to have perfectly understood the German, Low-Dutch, French, English, Latin, Greek, Italian, Hebrew, Syriac, Chaldean, Arabic, and Ethiopian languages. Her knowledge of science and her skill in music, painting, and sculpture were also extraordinary; and her talent for modelling was shewn by the wax portrait she contrived to make of herself with the aid of a mirror. When it is added that her letters were not only valuable for the elegance of their style but for the beauty of the written characters, which caused the said epistles to be preserved as cabinet curiosities, we may judge what a prodigy of cleverness was foreshadowed by the talents she displayed as a child.

In *A Father's Memoirs of his Child*, by Dr Malkin, it is just possible that the 'trivial fond records' of a precocious child may be dwelt upon with a minuteness betraying the partiality of a parent. Whether it is thought so or not in the present case, the biographer has furnished plenty of evidence to prove the extraordinary talents of his son. He tells us that Thomas Malkin learned to read, spell, and write with a rapidity that can scarcely be credited, and that on attaining the age of three years he wrote a letter to his mother with a pencil, and others to some of his relatives a few months afterwards. A year later he had learned the Greek alphabet, and had so far advanced in Latin as to write an exercise every day with a considerable degree of accuracy. He drew maps and heads with correctness, wrote fables in his seventh year and, made some respectable attempts at

poetical composition. His fertile imagination was displayed in his idea of an imaginary country called 'Allestone,' of which he gave vivid and intelligent descriptions. He wrote part of its history in a number of letters and tales, and drew a map of this fanciful kingdom, giving names of his own invention to the principal mountains, rivers, sea-port towns, and villages. This was however, one of the last efforts of his genius, for this youthful prodigy died before he was seven years of age.

John Barretier is declared to have been master of five languages when he was only nine years of age. In his eleventh year he published a learned letter in Latin, and translated the Travels of Rabbi Benjamin from the Hebrew into the French. Four years later the fame of his learning and writings attracted the notice of the king of Prussia, who sent for him to court. When passing through Halle on his journey, he so distinguished himself in his conversation with the professors of the university that they offered him the degree of Doctor in Philosophy. The whole university was delighted and amazed with his wit and knowledge; and on his arrival at Berlin the king honoured him with peculiar marks of distinction, declaring that such abilities properly cultivated might exalt Barretier in ten years to be the greatest minister of state in Europe. But the young philosopher was not dazzled with such prospects, and returned to Halle to pursue his studies. His health unfortunately gave way in his nineteenth year, and after lingering for eighteen months he died; another illustration of the expression 'too clever to live long.'

Another prodigy was Dorothy Schlozer, a Hanoverian lady, who was thought worthy of the highest academical honours of the university of Gottingen, and had the degree of Doctor in Philosophy conferred upon her when she was only seventeen years of age. Before she was three years old she was taught Low-German; and three years later learned French and German; and after receiving ten lessons in geometry, was able to answer abstruse questions. Other languages were next acquired with singular rapidity; and before she was fourteen she knew Latin and Greek, and had become a good classical scholar. She also made herself acquainted with almost every branch of polite literature, as well as many of the sciences. As an instance of this lady's indefatigable industry, it may be mentioned that she visited the deepest mines in the Harz Forest in the common garb of a labourer, to gain proficiency in mineralogy.

It is said that Blaise Pascal, one of the most profound thinkers and accomplished writers of France, exhibited precocious proofs of genius, especially in mathematics, from his earliest childhood. Having been purposely kept in ignorance of geometry, lest his propensity in that direction should interfere with the prosecution of other studies, his self-prompted genius discovered for itself the elementary truths of the forbidden science. When quite a boy, he was discovered by his father in the act of demonstrating on the pavement of an old hall where he used to play, and by means of a rude diagram he traced with a piece of coal a proposition which corresponded to the thirty-second of the First Book of Euclid. At the age of sixteen he composed a tractate on conic sections, which excited great

admiration. Three years later he invented his celebrated arithmetical machine; and at the age of twenty-six he had composed the greater part of his mathematical works, and made those brilliant experiments in hydrostatics and pneumatics which ranked him amongst the first natural philosophers of his time.

From such examples then, it will be seen that precocious cleverness has not in by any means every case betokened for the possessors either an unsuccessful life or an early death.

On the other hand however, we are inclined to think that the early development of unusual talent is but too frequently fraught with evil results to its possessor. At an age when he ought to be mingling with his fellows at school and joining in their pastimes, the 'prodigy' is pouring over books of abstruse science, or perhaps racking his young brain in thinking out some new mathematical problem, or perfecting some intricate machine. His self-imposed studies engross a great section of the time that might be more fitly employed in needful recreation or in sleep. The triumphs he may be presently achieving, or which he is yet to gain, are too frequently purchased at the expense of the joys which Nature gives to her more soberly endowed children.

THAT YANKEE WHALER.

ONE of the most striking headlands on the South African coast is the Bluff of Natal. Its majestic position, standing boldly out from the mainland, and rising straight up from the deep blue ocean to a height of several hundred feet; the brilliant hues of the thousand and one varieties of tropical foliage which cover its steep sides from top to bottom; the clear sky above, and the bright plumage of the birds flashing in the sun—all contribute to make the spot picturesque in the extreme. In the maze of the gigantic underwood on the Bluff, at the time of which I am writing, leopards, tigers, cats, monkeys, serpents, and other beasts and reptiles, roamed at will; the precipitous sides and wild entanglement insuring protection from the attacks of the hunter. Within the last few years a road has been made up the Bluff, and a lighthouse now crowns the summit. The inner or northern side of the Bluff forms one side of the Bay of Natal, while low sandhills inclose it on the north. The northern coast is irregular, and a sandhill projecting far into the bay almost cuts it into two parts; so forming a double harbour. From this point the harbour-bar stretches across; and the water being there very shallow, vessels of large size are prevented from passing into the inner harbour. Fortunately, however, the Bluff protects them on the south; and except when north or east winds are blowing, a tolerably good anchorage is obtainable. On account of the impossibility of emigrant ships sailing over the bar, the early emigrants were transported from the ships to the beach in the inner harbour in large surf-boats, and frequently had to be carried through the surf to the shore by Kaffirs. On the sandhill that divides the bay there stand a lookout and the Port-captain, or Harbour-master's house; and about two miles up the south shore is situated the town of Durban, the only road to which, at the date of this story, was through the bush-path.

Early in the afternoon of one of the hottest days of the summer of 1854, the thermometer registering something like one hundred and ten degrees in the shade, the bay as calm as glass, and the beach quite deserted, the men in the look-out were surprised to see a long rakish schooner sail round the Bluff and drop anchor in the outer bay. No sooner had she brought-to than a whale-boat was lowered and put off from her side. The Harbour-master hurried down, followed by half-a-dozen men, to the beach; and before the boat had reached the shore, a small crowd of white men and Kaffirs had gathered round. As the boat ran on to the shingle, a tall sallow man, whose bony frame, sharp eyes, and features proclaimed him an American before he spoke, jumped ashore and asked in a sharp nasal tone: 'Who's Boss [chief personage] here?'

'I am the Port-captain,' said that functionary, stepping forward. 'Do you want me?'

'Wal, yes, I do—some. I'm Cap'n of the *Southern Cross* schooner—thar she is. She's sprung a bad leak, and I want to beach her here and examine her timbers. My lads is a'most done up with pumpin'. She's fillin' most awful quick; and I want some men to come off and take a hand at the pumps. My crew can't keep on much longer, I guess.'

'Where are you from, and where bound, Captain?' asked the Harbour-master.

'I've bin cruisin' after whales, and thar's a pile of ile aboard. But sir, if we stop palav'ring here I shan't git my ship beached. What men can you git me, now, quick?'

'There's plenty of Kaffirs about,' said the Harbour-master; 'but you must get permission before you can take any of 'em off to your ship.'

'Permission!' echoed the stranger. 'Wal, I never! Who's got charge of this lot? Who do they belong to?'

'They don't belong to anybody. This is a British colony, Captain. But you must get leave to take 'em aboard, or else you can't have 'em,' replied the Harbour-master emphatically.

'Who'll give me permission—you?' asked the Captain.

'No; I can't; you must go and get a magistrate's order.'

'Whar's he to be found? Jest shew me the way. Look sharp, Boss, 'cos I'm in a mortal hurry, you know.'

The Harbour-master turned away, saying: 'Up in Durban, and'—

'How fur's that?' broke in the Yankee.

'A good two miles through the bush-path. You'll have to get a horse.'

'Whar'll I git one?' asked the Captain.

At this moment, Mr M'Kay, the government Land Agent, who, full of officious curiosity, had come down from the Custom-house, pushed through the crowd and said: 'I'll lend you a horse, Captain. Just come this way.'

'You're very obligin' sir,' said the Captain, turning and following the Agent. 'I'll accept your offer, and feel honoured.'

In a few minutes the horse was produced, and a nigger engaged to run ahead and shew the way. As the Captain mounted the horse, he turned to the Harbour-master and said: 'You'll be able to find boats enough to take fifty niggers off at once, eh?'

'O yes; we can do that.'

'Wal now,' said the stranger as a parting observation, 'ain't it a plaguy shame that a man can't save his ship without all this palaver? Here's the *Southern Cross*—as smart a schooner as ever sailed under Stars and Stripes—a-makin' water like mad, and I've to go through all this here performance before I ken git a few darned niggers to pump.' And away he rode towards Durban.

The magistrate not only gave the American Captain the necessary order, but opened a bottle of wine and, drinking to his success, promised any further assistance that might lie in his power; and in two hours after leaving the harbour the stranger was half-way back again.

During his absence, all had been bustle at the harbour. More Kaffirs had come down in the hope of being hired, and great was the amount of speculation as to the terms likely to be offered. These Natal Kaffirs are runaway Zulus, who, having once deserted, are barred from returning to Zululand under penalty of death. They are both brave and intelligent, and are a much finer set of men than the negroes of the west coast. From the look-out, the crew of the schooner could be seen pumping incessantly, a continuous stream pouring from her side; and Mr M'Kay, whose proffer of the horse was instigated more by the hope of profit than by disinterested kindness, for he was the owner of the surf-boats, was waiting with great impatience for the stranger's return, and calculating the amount he would realise by the business.

Sooner than could have been expected, the Captain came riding up at a rattling pace; and jumping from the horse, said: 'Here's the permission, Boss, all correct and complete. And now, how many niggers ken I hev?'

'Just as many as you like,' said the Harbour-master; 'there they are waiting to be hired.'

'Now, sir, tell me—what time in the mornin' ken I git over the bar? I draw ten feet of water.'

'Tide flows at six o'clock, and you could come over by eight, I should say,' responded the Harbour-master.

'Good. Wal, now, you boys, I'll give you seven and sixpence apiece to come and take turns all night. There's a powerful lot o' water in the hold by this time, and you'll hev to work, I tell you.'

The pay was high, and a murmur of satisfaction ran through the crowd; those among the Kaffirs who did not understand English having it explained to them by those who did. The terms were good enough for many a white man standing round to jump at; but to work side by side with niggers was too degrading, and they were obliged to let the chance pass.

'Wal, boys, what say?' asked the Yankee.

Several voices eagerly accepted the terms, and the Harbour-master asked how many he would engage.

'Jest you stand in a row, boys, and I'll pick out the likely ones. Be smart; the sun'll be down before we git aboard, if you don't be slick.'

The Kaffirs were soon in line. The Captain walked up and down, surveying them, and carefully picking out the biggest and strongest, until he had selected about sixty. This was a large number for the work; but it was put down by Mr M'Kay and the Harbour-master to Yankee

enterprise; and in a few minutes the surf-boats with all the niggers on board were afloat.

'I will come off to you in the morning, Captain, and bring you a pilot,' said the Harbour-master.

'Wal, now, that's friendly of you, Boss. Really, if you would, I should take it kind,' responded the Yankee.

'I will,' said the Harbour-master; 'I'll come off when the tide makes.'

'Thank you, sir,' said the Captain, as he stepped into the whale-boat. 'You won't forget to come?'

'Certainly not,' replied the Harbour-master. 'Good-night.'

'Good-night,' said the stranger, with a grim smile, waving his hand as the boat pulled away.

When the surf-boats returned, the men with them reported the *Southern Cross* to be just as smart and trim a craft as the Captain had said she was. They also reported the safe transference of the dingy volunteers. The sun went down, and in ten minutes the scorching hot day had given place to a beautiful tropical night.

Before the sun had risen on the following morning, the Port-captain, Mr M'Kay, and the look-out men were already assembled on the sand-point; and as the first flush of daylight came rapidly spreading over land and sea, they strained their eyes across the bay, eager to catch an early glimpse of the schooner, whose arrival and condition had caused such unusual excitement the day before. Well might they start and stare in speechless astonishment. There was the bay all right, and there was the Bluff beyond it, but nothing else! No *Southern Cross*! No ship at all! Nothing to mark where she had lain at anchor on the previous night. What could it mean? Could she have foundered with all hands? No; for there was not depth of water sufficient to cover her masts if she had. Could she have broken away and gone ashore? Impossible, for the wind, a mere capful, was off the land.

'She's gone!' was the first exclamation which broke the silence—'clean gone!'

'What can it mean?' asked Mr M'Kay.

'Mean?' said the Harbour-master—'mean! That we're all born fools—that's what it means.'

'Whv, how?' gasped the bewildered Agent.

'How?' responded the Harbour-master. 'Why was he so particular about the sort of Kaffirs he engaged? Wouldn't any kind of Kaffirs do for working pumps? Of course they would. I can see it all now. She was no whaler. She had sprung no leak. She was a Yankee slaver, that's what she was; and we ought all to be shot for not seeing it before.'

A thrill of horror passed through the group. It was as clear as daylight now.

'But we saw them pumping the water out of her,' said the Agent, after a pause.

'Of course you did. But you didn't see the other side of her, did you, Mr M'Kay?'

'Well, no,' responded the Agent.

'No; but if you had, you'd have seen 'em pumping the water in! That's what it was, Mr M'Kay—the rascals were pumping it in on the starboard side, and out again on the port; don't you see?'

'Yes, I see now,' sighed the Agent.

'Sixty niggers kidnapped before our very eyes!' continued the Harbour-master. 'A pretty thing, upon my word!'

'Beg pardon sir,' said one of the men; 'p'raps she's in sight now sir—if we was to pull off in the boat round the Bluff head sir.'

'What's the good of that?' growled the Harbour-master.

'O'ny p'raps we might see what course she was a-takin'; and in case the Admiral was to come round, we could say which way she was a-goin' sir.'

'Oh, she's out o' sight by this time, never fear,' said the Harbour-master. 'But man the boat, and we'll see.'

Away went the men to get the boat out; and away went the Harbour-master and Mr M'Kay after them down to the beach.

'No wonder he was so particular, the rascal! Why, every one of those Kaffirs will fetch five hundred dollars in America. He's done a very fair day's work, and no mistake, Mr M'Kay.'

'Yes; and never paid me for the hire of my boats,' dolefully responded the Agent; 'and I lent the scoundrel my horse too!'

'Well, it's no use now. But where our senses were, Mr M'Kay, to be outwitted like that, I can't think. I shall hear of this again. If only the Admiral would cruise round here, we might catch 'em now; but we shan't see him for months, maybe. It's about the deepest move that ever I heard of.'

By this time the boat was out and manned, and a hearty pull took them to the Bluff head in half an hour; but no sign of the slaver was to be seen.

The next day a southern-bound brig dropped anchor in the outer bay, and sent ashore for some fresh meat. The Harbour-master went off to her, and gave the captain a letter to deliver to the Admiral if he fell in with him, or to leave at the Cape if he did not. Although the letter reached the Admiral within a week, and he put off to sea on the chance of falling in with some news of the *Southern Cross*, no more was ever heard of that Yankee Whaler.

EXPERIENCES OF A STROLLING ACTRESS.

IMPROMPTU DROLLERIES.

My first experience of a theatre was a particularly unpleasant one. My mother—leading lady in a south of England *corps dramatique*—when I was a tiny urchin, after many entreaties on my part took me with her one evening, and placed me in an out-of-the-way nook behind the scenes, to see the first act of the piece, which she told me was called *The Vampire, or the Bride of the Isles*. I had not the least notion of what either a vampire or a bride might be like, but was on the tiptoe of expectation; when my mother suddenly recollected that she had omitted to put on the tartan silk scarf which, as the Lady Margaret, it behoved her to wear, and told me to fetch it from her dressing-room. Intent on obeying her, I ran half-way across the stage, when the floor suddenly

opened beneath my feet. I fell a long, long way down, and alighted in the arms of a hideous Monster, with a yellowish-green cadaverous face and long dishevelled hair. The ground closed at once over our heads. Escape was impossible; and a feeble distant light just served to shew me that this frightful wretch and I were alone in a capacious dungeon, surrounded by beams, cranks, screws, blocks, and pulleys. At that time I knew not their names; but from my remembrance of some pictures that had been shewn me in a story of the Inquisition, I at once recognised in them instruments of torture and of death!

The Monster, who seemed quite at home in this terrible abode, tried to comfort me when I cried; but the closer he hugged me to his breast, the more terrified I was. At last he saw a man in a white jacket coming towards us, and called out: 'Here, Watty, come and take this child to her mother.'

'Hollo!' said the man, 'has little missy fallen through the vampire trap?'

Dimly I began to comprehend that the ugly Monster was an actor waiting in that dark and dismal cave until he should be wanted on the stage; for I had seen a pantomime in which a beautiful lady had disappeared through the ground; but *she* came up again presently, without seeming any the worse; whereas it took *me* all the evening, even when quite safe on *terra firma*, to recover from the effects of my transit to the shades below.

To the uninitiated, many expressions heard within the walls of a theatre sound strangely enough; for example, the property-man says to his subordinate: 'Joe, just iron those waves out, will you? I'd like 'em nice and straight for the *Colleen Bawn*.' Joe's reply being: 'I'll do 'em by-and-by; they're too damp at present.' Or, 'Has any one seen the crash?' Or, 'Who made that hole in the leap?' 'Go and ask the wardrobe-keeper for the red cloaks for them supers as has to sit as mucky-coves [magnificoes] in the Senate Scene.' 'This thunder's worn out; it's cracked from top to bottom.' And so on.

One actress says to another: 'Please lend me a "scream" for *Fiordelisa*' (*Fool's Revenge*). To 'draw first blood' is to get the first round of applause in a piece. 'A pill' is a long disagreeable part to study. A character easy to personate and acceptable to the public is described as 'all sack and sugar.'

Calls and Encores.—Surely these compliments have now arrived at the height of absurdity. By degrees we have become reconciled to seeing Othello and Desdemona, Richard and Richmond, Lady Isabel Carlyle and her child, Leah, &c. whom we have just beheld die—as per the author's decree—resuscitated at a moment's notice, solely for the purpose of bowing their acknowledgments to an admiring auditory. This may gratify the artistes' vanity; but it certainly helps to destroy the interest in the drama's illusion; and I entirely

agree with an old Yorkshirewoman, who observed, on seeing Lear and Cordelia come before the curtain in response to a 'call' just as she was shedding tears of pity for their hapless fate, that it was 'nowt but babby-wark' (that is, child's-play). Recently, the ghost of a murdered Countess, in the old tragedy of *The Castle Spectre*, was encored at the conclusion of the fourth act, after having appeared with lamp and dagger, and a wound in the breast, kissed and blessed her daughter—who affrighted, fainted away—and then gliding back, vanished gracefully through the folding-doors of the Castle Oratory in a flood of blue-fire, to the music of an impalpable harp, and a chorus of (supposed) angels' voices lustily singing 'Jubilate!' Nothing therefore, could be more absurd than for the young Lady Angela to have to recover suddenly, to be again overcome with terror, and again to fall into a swoon, while the shade of her respected parent went through the same 'business' as before, and made a second exit, under precisely the same circumstances as on her previous appearance, and with all the accompaniments of blue-fire, harp, and chorus.

Performing dogs, camels, donkeys, goats, pigs, and even a magpie—of silver-spoon notoriety—have had to respond to 'calls.' The very latest eccentric demonstration that I know of was in the drama of *Under the Gaslight*, when the locomotive had again to steam on, and fizz its thanks to an irresistible encore!

'*Stage waits.*'—Nothing throws such a damper over a performance as a 'stage wait.' One night at a theatre in Yorkshire a piece was to be represented in which four of the ladies and gentlemen of the company should have begun the second scene. They were not forthcoming at the appointed time. The fact is they were two pairs of lovers in real as well as in stage life, and had run away to get married in opposition to their friends' wishes. Presently, the audience grew clamorous, and began to hiss. The manager went on to crave their indulgence—being obliged to change the play—and the only apology that occurred to him was that 'the Misses Blank and Dash, and the Messrs Brown and Jones, had all been suddenly taken ill;' an announcement that caused roars of laughter, and restored good-humour to the much enduring audience.—One night Prince Ludgar went off to address a disloyal multitude, and should have been seen almost immediately at the back of the stage haranguing them from the battlements; but oblivious of this duty, the Prince had retired to change his costume, and after a tedious 'wait,' the act-drop was lowered amidst yells of disapprobation; and the unlucky actor expiated his fault on the following 'treasury day' by a fine of half a sovereign.—At Liverpool a star came to play in a brand-new comedy. The theatre is large, and the dressing-rooms are numerous; the one appointed for Mr B—to occupy was so distant from the orchestra that the overture was unheard by him; the call-boy, of course, was sent to summon him; but full ten minutes elapsed before the gentleman was found. Meantime, the curtain rose. The lady who began the piece spoke a long speech, and then quietly awaited the arrival of her supposed son, who, however, did not make his appearance until after a tedious 'wait.' Here, there were no hisses, the theatre being attended chiefly by the upper classes;

but the delay spoiled the star's reception, and acted as a wet-blanket on the evening's amusement.

Realism.—A lady playing Louise the blind orphan girl, who had just been rescued from drowning, stands at the wing with a couple of pounds of pulverised ice hanging round her neck, in order that when the cue for her entrance is given, she may go on the stage shivering violently; and she frequently stands ill-clad and bareheaded at an open door on a wintry night, as her maid phrases it, 'practising her shivers.' Such devotion to 'realism' is only exceeded by that of a certain actress, who, if report be correct, used to medicate herself every evening in her famous dying scene. Owing to the potion that she swallowed being actually poisonous, the convulsions and spasms that followed were strictly genuine, and highly appreciated by the spectators. An antidote used to bring the artiste to in about an hour.

Managers.—One of our best English managers is famous for writing a gigantic hand, spreading a very few words over several pages of note-paper. The response to Mr York's application for an engagement as juvenile gentleman was brevity itself, consisting merely of one line from *The Slave*, in which Fogrum continually appeals to his Yorkshire Mentor, Sam Sharpset, for advice and assistance—namely, 'York, you're wanted!' Here too is a copy of one of the foregoing manager's most lengthy epistles: 'DEAR SIR—I cannot engage you this season'—that filled page number one; and on turning the leaf, the recipient would read as follows—'unless you accept of ten shillings a week more than before; you are worth it.' An excellent manager this.

I subjoin a few more anecdotes which may perhaps amuse my readers.

A juvenile gentleman whose voice was not by any means powerful, was representing Macduff. On his observing: 'My voice is in my sword,' one of his auditors called out: 'I'm glad you told us, Harry; we were just wondering where it was.'—Another actor in the same character—well known to be an excellent combatant—was one night seized with a sudden and uncontrollable presentiment that he should be mortally wounded in the fight that terminates the tragedy, so threw his sword down, and made a hasty and ignominious retreat. Poor Macbeth thus left in the lurch, imagined that some alarming illness had caused his enemy to back out. What was to be done? His death alone could satisfy poetic justice, and bring the piece to the orthodox conclusion; so in desperation he rushed off and dragged in the first person he met with; this happened to be the physician. Handing Macduff's sword to him, he spoke this remarkable extempore speech: 'As killing is thy trade, now try thy hand upon thy master, as proxy for his coward foe.' The combat was fought, and terminated of course with the tyrant king's being defeated and stabbed through and through several times—to make quite sure of him. The audience cheered and called uproariously for the combatants. But the manager was not so well pleased, and fined the trio of actors—Macduff for not attending to his business; Macbeth for daring to 'gag' (take liberties with the text) in Shakspeare; and the unlucky physician for doing what he was actually forced to do.

A very weak tenor in Dublin singing feebly, caused one of the gods to shout to an acquaintance across the gallery: 'Corney, what noise is that?' 'Bedad,' said Corney, 'I believe it's the gas whistlin' in the pipe.'—In the same lively city, a late mayor gave his patronage, and was hailed with 'a cheer for the ex-mayor!' When quiet was restored, a voice called out: 'Now, boys, a cheer for the Double X mayor!' (Mr Guinness the great brewer was the gentleman then filling the civic chair.) A Sir William Fondlove, in *The Love Chase*, summing up his personal advantages, says, conceitedly enough: 'I'm every atom what a man should be.' A man slightly lame was playing the part, when at this point a voice from the pit cried: 'Barring the gamney leg, Freddy.'—On an Iago, who was disfigured by a frightful obliquity of vision, saying to Othello, 'Wear your eye thus;' one of the spectators unkindly remarked: 'He can't, you fool! he hasn't larnt to squint.'

A very tedious old actor, whose Hamlet occupies four hours, was once playing the part in a town in the Potteries, and with plenty of emphasis, but no discretion, was 'ladling out' the celebrated soliloquy, 'To—be—or—not—to—be,' when an irreverent gallery-boy called out to him: 'Oh, toss up for it, mister, and don't preach.'

I was waiting at the wing one night to go on in the Grave Scene in *Hamlet*, when suddenly Mr Seek, who was the grave-digger on that occasion, asked me what tune he ought to sing his verses to; so I whispered to him to sing them to the same tune as he had been singing something to the previous evening. He had never before gone on for the grave-digger, and had forgotten the text, so actually sang both words and tune as before:

Three children slid upon the ice,
All on a summer's day;
It so fell out they all fell in;
The rest they ran away.

This occurred at Workington, and strange to say, the highly respectable audience made no sign of being surprised at this strange version!

In a seaport town, Black-eyed Susan's husband, the far-famed William, was thus addressed by the admiral, after his trial for striking his captain: 'The sentence of this court is, that you be hanged at the yard-arm of every ship in His Majesty's service; and heaven have mercy on your soul!'

THE IRISH WAYFARER.

A SUMMER or two ago I was spending a happy holiday at a Highland sheep-farm nestled in the wild hills of Lochaber, whose mountain streams, like silver threadlets, fall murmuringly to sleep in the blue lake below. No sound but the drowsy hum of heather-bees, unless at intervals the bleating of the sheep, or the wailing notes of the curlew, broke the silence of the hills.

The farm itself was picturesque to a degree, with even a well-trimmed garden, where, in this rocky fastness, the pale blush-rose was not afraid to grow. But to my hero. One warm summer afternoon, as we were all engaged in the hayfield, some giving good assistance, and others, like myself, amusing ourselves, a

worn, weary-looking man was seen to approach. He carried a bundle on his back, and leant upon a large stick. The stranger raised his hat as he approached, but looked shy more than anything else, and did not speak. At a nearer view, I saw that the man was young comparatively, though fatigue and exposure had aged him, and turned his hair to iron gray. The farmer asked him, with the quick native instinct of hospitality, if he wanted a night's lodging; to which he replied, that it would be a great kindness if he were allowed to sleep in the barn or any other place; and directly I said to myself: 'You are an Irishman, but you are not an Irishman of the lower orders.' The rich accents of his mother-tongue fell mellifluous, and as I looked at him I saw the open countenance and honest blue eye of his race. His dress was threadbare and tattered, though he strove to conceal it as much as possible; and his whole appearance indicated a forlorn woe-begone stranger—a wanderer, in fact, houseless and homeless. The night shadows began to fall and day steal away as we returned to the house; and after supper, according to custom, as a family we proceeded to the big kitchen, where shepherds, servants, and dogs had all gathered for family worship.

Next morning, in wandering about the yard I met in with our stray visitor, whose name was Charles Macarthy, and something about him attracted me strangely; I felt fascinated by him; but that feeling was general among the other members of the family, for he had been already invited to stay and rest here another week. He was shy, as I said before, with nothing of the manner of a beggar about him; neither forward nor intrusive, and never trying to appeal for pity.

I drew from him at intervals many interesting details. He told me that he led this wandering life on account of a great Unrest that possessed him; that he was troubled with depression of spirits; but that he should recover himself. This last remark he always kept repeating. He said: 'My friends are in Ireland; but I cannot possibly go to see them till I recover myself; for they would be ashamed to recognise such a poor wretch as I am.' I inferred from his account of his early life and education, that he must have been a member of a distinguished Irish family. He read and spoke the Latin, French, and German languages with fluency, and seemed to be familiar with every detail of British, and I may say European history. He told me he had at one time made a special study of the history of the popes; and he spoke of monastic life and rigours in Spain and Italy with such seeming knowledge, that it slowly dawned on us that this wanderer had at one time been a devoted servant of Rome. Indeed one day, as he was sitting at a table painting a crucifix and shrine, which he said was to be a present for me, an old servant observed to me in Gaelic (of which we imagined he knew nothing): 'I'm thinking he's an old priest.' He flung down

the brushes, turned on her with a face black as thunder, and demanded angrily: 'How did *she* know he was an old priest? and what was her business with what he had been?' For the rest of the day he went about gloomy, and remained in that state till next day. That afternoon the lady of the house (who was poor Charles Macarthy's best friend), her cousin and I, were in the drawing-room having some music. After some time a timid tap was heard at the door; and on opening it, here was our strange guest quite subdued by the 'concord of sweet sound.' He begged that if he were allowed into the room, he might leave his old shoes outside; and this faint request was graciously acceded to. My friend asked him if he could play, and he replied that he would like to touch the instrument. He sat down; and verily the instrument seemed to live under his touch, and such a rare flood of melody followed as I have seldom listened to. His music was entirely classical, and much of it appeared to be voluntaries, or selections from masses. We more and more suspected his connection with some Roman Catholic order, from discussions which took place in the house during his stay; but in these he never became heated or overbearing, speaking with knowledge and firmness on the general question, but repelling personal investigation.

He told me he had travelled the length and breadth of Scotland on foot, and had at this time crossed the hills from Glentinnan, where the priest, a fine gentlemanly man, had had a long conversation with him, and given him his supper and a half-crown.

On the following Sabbath we went to church as usual, and left Macarthy, apparently in good spirits, with the shepherds.

On our return, I observed that he wore his moody expression, and did not meet us with his usual open smile. He could not be got to tell what was wrong with him. I pressed him, and at last he volleyed out: 'What is *not* wrong? None of you have spoken to me to-day. Why did you all go away and leave me here alone? I have been associating to-day with creatures not one step removed beyond the brute creation.' And this was the cause of great offence; the simple uneducated shepherds were not society congenial to the soul of this wayfarer. Poor fellow! he was immediately angry with himself for this outburst, and begged next day to get the Family Bible, in which he inscribed the names of the children in the most exquisite illuminated styles. In these painted devices he excelled any I have ever seen, and I cherish in my manuscript album some choice specimens, the handiwork of Charles Macarthy. I am happy to possess also some English and French verses from his pen, and these are the most admired in my book.

The subject of my tale left us in the beginning of the following week, and I felt a keen pang of regret as I saw the last of the poor wayfarer. He left behind him a pleasant remembrance not soon to be eradicated. It was touching to contemplate a mind so gifted, so stored with rare intelligence; a person so distinguished-looking even in poverty and rags; a taste so fine, a courtesy so natural—all untinged, 'like sweet bells jangled,' by the overwhelming load of an ever-recurring melancholy.

[Should the foregoing narrative meet the eye

of the Wayfarer or of any one acquainted with his subsequent wanderings, we should esteem it a favour to be made acquainted with any further particulars of interest.—Ed.]

THE MONTH. SCIENCE AND ARTS.

THE Report of the Select Committee of the House of Commons on Electric Lighting has been published, and may be regarded as favourable to the new process of illumination; but not favourable to the conferring on gas companies the privilege of laying on the electric light, which, committed to their care, might have a slow development. And the Committee are of opinion that the time has not yet arrived for giving general powers to private electric companies to break up the streets; but the proprietors of large buildings, lecture-halls, theatres, factories, are free to generate electricity for their own use without further delay or legislative sanction. As regards the light itself, attention is drawn to the peculiarity that it produces a transformation of energy in a singularly complete manner. The energy of one-horse power, for example, may be converted into gas-light, yielding a luminosity equal to twelve-candle power; but the same amount of energy transformed into electric light produces sixteen-hundred-candle power. 'It is therefore not surprising,' as stated in the Report, 'that while many practical witnesses see serious difficulties in the speedy adaptation of the electric light to useful purposes of illumination, the scientific witnesses see in this economy of force the means of great industrial development, and believe that in the future it is destined to take a leading part in public and private illumination. On one point all are agreed—namely, that the electric light will produce little of that vitiated air which is largely formed by the products of combustion of ordinary illuminants.' And further, the scientific witnesses are of opinion that 'in the future the electric current may be extensively used to transmit power as well as light to considerable distances, so that the power applied to mechanical purposes during the day may be made available for light during the night.' On the question of cost as compared with gas, the Committee are not of opinion that the economy for equal illumination has been conclusively established.

The theory that there is some relation between terrestrial magnetism and manifestation of sunspots is strengthened by researches made at the Royal Observatory, Greenwich. Mr Ellis, one of the assistants in that establishment, after careful examination of the observations made from 1841 to 1877—a period of thirty-six years—including the diurnal range of magnetic declination and horizontal force, finds that 'in addition to the ordinary diurnal and annual changes, there appears to exist, in the magnetic diurnal ranges, an inequality of marked character, and of longer period, resembling in its features the well-established eleven-year sunspot period.' And that which is true of the regular movements is true also of the irregular, as very remarkable correspondences are shewn between the rapid sunspot and the sudden magnetic variations; but generally the magnetic epochs are somewhat later than the corresponding sunspot epochs. And lastly, Mr

Ellis states that 'it seems probable that the annual inequalities of magnetic diurnal range are subject also to periodical variation, being increased at the time of a sunspot maximum, when the mean diurnal range is increased, and diminished at the time of a sunspot minimum, when the mean diurnal range is diminished.' This confirmation, under the authority of Sir George Airy, Astronomer-Royal, of an important theory, will be very interesting to physicists.

It has been proved in Paris that vicious horses may be effectually cured by electro-magnetism. With bits, bridles, nose-bands, and curbs specially constructed so as to apply a gentle current to the required place, the current being supplied by an electro-magnet easily portable, seven of the most violent horses among twelve thousand were reduced to obedience, and allowed themselves to be shod. Some horses required two applications, some three; but all were completely cured of their vicious propensities, and without any weakening or stupefying effect. Particulars of the method of treatment, and the results, are published in the *Procès-verbaux* of the *Société d'Encouragement pour l'Industrie Nationale*.

Dr Cunningham, of the government sanitary staff in Calcutta, has made a careful investigation 'on certain effects of starvation on vegetable and animal tissues.' One effect in the human subject is the destruction of the intestinal mucous membrane. Hence the digestion and assimilation of nutritive materials supplied in the food must necessarily be impaired or destroyed, according to the degree of morbid change. Under such circumstances, the food elements not being submitted to their normal transformations, become mere foreign bodies liable to undergo decomposition, and well adapted to cause irritation. The conclusion to be drawn is one that should be kept in mind by the functionaries appointed to administer relief in time of famine. The starvation must not be allowed to go on too long; for, as Dr Cunningham observes, 'the fatal diarrhoea and dysentery first manifested itself in people after their admission into the relief camps. The investigations shew the absolute necessity of great caution in regard to dietetic experiments and dietetic systems of punishment. They shew that it is not safe to push such procedures in the belief that so long as no evident active evil results present themselves, we can at any time pull up and restore things to their normal state.'

Dr Roberts, F.R.S., of the Royal Infirmary, Manchester, has found that the property of milk-curdling is not exclusively confined to the gastric ferment, as has long been supposed, but that the pancreas of the pig, the ox, and sheep yields a ferment of similar property. 'The brine extract of pancreas,' he remarks, 'or pancreatic rennet as it may be called, seems to act on milk exactly in the same way as rennet made from the calf's stomach. It coagulates casein actively, both in neutral and alkaline milk, and it may be assumed as probable—at least until further inquiry—that the curdling agent of the stomach and the curdling agent of the pancreas are one and the same ferment.'

Mr Gunning, in order to test Pasteur's assertion that micro-organisms (germs) can exist without free oxygen, constructed apparatus entirely of glass and therein inclosed quantities of putrefy-

ing matters with which putrefaction-bacteria had been mixed, and excluded oxygen as far as possible, in some instances substances being used to absorb the oxygen, in others the vessels being filled with hydrogen or nitrogen. The experiment was carried on at different temperatures during eighteen months, and the conclusion drawn is, 'that exclusion of oxygen produces the death of the bacteria, and stops the putrefaction;' and that putrefaction does not begin again unless fresh bacteria are introduced when air is admitted.

As part of the works for the supply of water to the town of Lausanne, a tunnel was hewn through a sandstone bluff. During the excavation the workmen found exuding from the crevices in the rock a milky white gelatinous substance somewhat resembling starch, to which they gave the name 'mineral bacon.' This novel substance was talked about. Specimens were obtained by Professor Renevier, who has given an account of his examination thereof to the *Société Vaudoise des Sciences Naturelles*, and from this we learn that the so-called mineral bacon is a gelatinous silicate of a kind hitherto undescribed, but having some similarity to a substance known to mineralogists as Chabasie. The difference between them, as Professor Renevier suggests, may be merely a difference of crystallisation; and we may, he remarks, 'consider our gelatinous silicate as a Chabasie in course of formation. Soft and amorphous substances, are they not, in fact, minerals in an embryonic state, while crystals are minerals in a perfect state?'

As supplementary to this curious fact in Switzerland, we mention the discovery of mineral wax, ozokerit, in the Wahsatch Mountains near Lake Utah. A district sixty miles in length by twenty in breadth is occupied by beds of shale, and in this shale the wax occurs in layers varying from a streak to twenty feet in thickness, and the quantity is described as 'enormous.'

In 1865 a boring for petroleum was begun near Goderich, Upper Canada, on the border of Lake Huron. The adventurers found not what they were in search of, oil, but a bed of rock-salt thirty feet thick, at a depth of nine hundred and sixty-four feet. Since then, within a distance of fifty miles, other borings have made known the existence of beds of pure salt from ten to sixty feet in thickness. In some places, deposits of brine have been met with, which already are turned to profit in the manufacture of salt on a large scale; and as mining operations to 'get' the rock-salt are planned, there will be a further development of the industrial resources of the region round Goderich.

A writer in the *American Journal* makes known that 'terrible destruction' is going on in the forests of Nevada by the mining population, who are utterly reckless in the use of timber. The forests of that state, he remarks, consist of a few species adapted to struggle with adverse conditions of soil and climate, and are of immense age, most of the trees having reached maturity only after centuries of exceedingly slow growth. On this account, and on their importance in so dry a climate, as reservoirs of moisture, he recommends that the forest-ranges belonging to the general government should be carefully protected. Among the trees, a species known as Nut Pine (*Pinus monophylla*) is pointed out as suitable for the bare and dry hill-sides of

the south of Europe, which have so long resisted the endeavours made to plant them with any European tree. While young, the Nut Pine grows strictly pyramidal; the pleasing glaucous tints of its foliage commend it to the lovers of ornamental conifers; and its delicately flavoured seeds, produced in enormous quantities, would be no unimportant article among the food resources of a hill-country.

A statistical Report drawn up by the Secretary of the British Embassy at Washington contains particulars of the agricultural produce of the United States, which seem amazing. Last year, thirty million acres, an area nearly equal to the whole of England, were under wheat, and the produce was more than four hundred and twenty-two million bushels. The estimate for the present year is sixty million bushels more. The yield of oats from twelve million eight hundred thousand acres was more than four hundred and six million bushels; of barley from one million six hundred thousand acres, more than forty-two million bushels; and of buckwheat about twelve million bushels were harvested. But maize heads the list with thirteen hundred and forty-two million five hundred and fifty-eight thousand bushels, from fifty million three hundred and sixty-nine thousand one hundred and thirteen acres, in 1877. Add to these magnificent totals the potato and other root crops, and as we hinted in a recent article, the claim of America to feed the world will be acknowledged.

The Cooper Union is a New York institution for the advancement of science and art. The trustees, in their twentieth annual Report, just published, state that their chief aim is to teach all conditions and ranks of men and women to work with their hands: they consider it as important for a man with pecuniary resources to be possessed of manual skill, as for one who must earn his daily bread. They believe that schools of industry are a better safeguard against anarchy than 'schools' of knowledge, and that the general misery and pauperism, ever ready for vice and disorder, are more threatening to the maintenance of good government than what is called 'ignorance.' The results so far are encouraging: the number of pupils in the day and evening schools has been at times three thousand a day. In the Art School for women, drawing, painting, photography, and wood-engraving are taught; a department of telegraphy offers a resource to those devoid of artistic faculty; and for men there are schools of practical mechanics and engineering. In addition to all this, there is a library of more than fourteen thousand volumes, which is much resorted to; and prizes are given to the most proficient of the pupils.

Perhaps it is not so well known as it ought to be that there are many places in London where mechanical instruction is given, and that more will shortly be available. The City Guilds are about to establish Technical Schools; and a society—the Amateur Mechanics' Workshop Association—are taking measures for the opening of workshops 'wherein students, clerks, and others not at school may be taught practical science and mechanics during their leisure hours.' They already possess lathes, cabinet-makers' benches, glass-blowing apparatus, and a variety of tools; and, as is stated, several gentlemen well known in the scientific world are prepared to instruct. The number of members is already about six hundred, and a class

for the study and construction of electrical apparatus is making good progress. We heartily wish success to this praiseworthy undertaking.

The *Journal* of the Asiatic Society of Bengal contains an account of a very remarkable snow-fall that took place in Kashmir, to the astonishment alike of the inhabitants and of meteorologists. Early in October 1877, snow began to fall, and continued almost without intermission up to May 1878, when the general depth was estimated at from thirty to forty feet. The effects were disastrous. Houses and villages were crushed under the enormous weight; long ranges of hill-slope, with all their trees and vegetation, were swept away by avalanches, which left huge gaps in the primeval forests; and wild animals, chiefly the ibex and bears, perished in large numbers. Much of the snow remained unmelted even in September 1878.

The President of the Society, Mr W. T. Blanford, F.R.S., in his last anniversary address, expresses his hope that something will be done to remove the reproach that we have less knowledge of the rivers of India than of Africa, and that the sources of the Nile and Congo have been explored before those of the Brahmaputra and Irawadi. To penetrate Tibet, and thence explore the upper waters of the great streams that irrigate our Indian territory, would be difficult; but able and willing explorers are ready to offer their services. If these are not accepted, the task will be accomplished by some adventurous Russian or German.

Since the establishment of a central meteorological office for the whole of India, telegraphic weather reports are received every day from forty-nine stations, ranging from Assam to Ceylon, and from Bombay to Burmah, giving the readings of barometers and thermometers, direction of wind and rainfall. On receipt of the reports at the government headquarters—Simla or Calcutta, according to season—they are printed with remarks, and promptly circulated. This practice is to be continued, with the addition of lithographed weather-charts for India, similar to those published in Europe and the United States. 'The time may come,' says Mr Blanford, 'when a meteorological report will have to be posted at every thannah (police station) in the empire, in order to warn farmers when to expect rain or fine weather for their crops; and there can be no reasonable doubt that either a continuance of dry weather or heavy rainfalls could, in India, as a general rule, be foretold several days beforehand even now.'

Cyclones are carefully investigated, and some knowledge of the laws by which their movements are regulated has been obtained, and it is hoped that warning of their approach may ere long be given by telegraph. Destructive as those whirling storms are on the water, they are far more destructive on the land by their huge invading sea-wave. In the Backergunge cyclone of 1876, one hundred thousand human lives perished; and at Masulipatam, thirty thousand persons were swept away in a single night.

With reference to Overseeing in Demerara—an account of which we recently gave—the Colonial Company, 16 Leadenhall Street, London, will supply all needful information. In reply to many inquiries on the subject, we have to state

that it is hazardous to go out to Demerara without having a situation previously secured, or letter of introduction to some person of influence in the colony.

BIRD-NOTES.

THREE SKETCHES FROM NATURE.

We are indebted to a lady contributor for the following bird-notes.

Birds are not usually credited with half the intelligence or good qualities that are freely attributed to a few favoured animals; but many well-authenticated instances prove them to possess a very large share. The following cases came under my own eyes. The first I will relate occurred when I resided in a detached country-house far from any town, and where I had many feathered friends, with whom I became on the most confidential terms. The winter had been exceptionally severe and long, the snow lying deep on the ground for a considerable time. The birds had suffered terribly. I had a large muster of daily pensioners; but as numbers were still frozen to death, I had an unused room turned into a refuge for the destitute, a temporary home for my out-patients; and soon had a perfect aviary in it by merely leaving the window open from early in the morning till dusk. There were representatives of many families, and amongst them some not usually on sociable terms with mankind. One robin was soon the tamest of all my welcome visitors, and he remained long after the rest had left. He was so perfectly fearless that he not only made himself quite at home in his own quarters, but he would fly into an adjoining sitting-room, alight on the breakfast-table, pick up crumbs, and to the surprise and amusement of all, even perch on a loaf of bread and help himself, calmly looking round with his large expressive eyes in a most entertaining manner, and eventually returning to his adopted home, where there was food and water; therefore neither hunger nor thirst could have led him to pay these visits.

As the warmer days came on, he would sit near the open window and sing in the sunshine. He at length flew out; and I feared that I should not see my pretty friend again; but towards evening he returned to roost, and I closed the window as before. He continued to fly away and return thus for some time. Then he came in no longer, but would sit in a laurel bush close to the window and sing most sweetly. By degrees he came less frequently, and when birds began to build, I lost sight of him. I left the neighbourhood shortly after, and with sincere regret bade farewell to the hope of seeing my grateful little favourite again. I only trust that if he returned and sought for shelter in other winters, he may have found a welcome from later occupants of the house. I shall never forget his gratitude and trustfulness; and all robins will for his sake be specially endeared to me. He was a beautiful specimen of his class; and I often thought, in listening to his sweet wild notes, and in admiring his bright brown plumage and his vividly red breast, that if he had been a native of some tropical land, a far higher value would have been by most people

set upon him. But 'no man is a prophet in his own country and amongst his own kindred.'

The second of my recollections in illustration of bird-life will be a very brief story to tell; but it caused perhaps more actual amusement than either of the others. The servants had been for some time in the habit, during some very hard weather, of feeding a house-sparrow at the kitchen-door, and by degrees had lured him into coming inside. He grew so tame, that when they were sitting at the table he would hop about close to their chairs and go in and out underneath the table, and in this manner was a constant visitor for some weeks. He also subsequently visited my portion of the premises, and we became even greater friends. When the frost disappeared, I thought the sparrow had left us; for on inquiry I found that he had not been seen for some days. One warm sunny morning I had opened the French-windows, but did not notice him outside, when suddenly I heard an extraordinary sound, something like the squeaking noise made in using india-rubber, or that of love-birds when going to roost. There on the carpet close to my feet was our old friend the sparrow, making an insane attempt at singing; and the house-sparrow not being exactly a song-bird, the nearest approach that he could make to music was the indescribable serenade that I had heard. He looked most ludicrous, warbling his love-song in his new rôle of tenor. I have no doubt that he was doing his utmost to express his thanks for our hospitality. It was the best acknowledgment that he could make, the sweetest song that he could sing. Sims Reeves could have done no more. After exhausting all his powers of vocalisation, he flew away, and we never, to our knowledge, saw him again.

The third of my *souvenirs* probably the inhabitants of towns will consider a purely imaginary story, but it is nevertheless strictly true; and country residents, in their constant observation of the habits of wild-birds, I have no doubt often hear of and witness instances quite as curious. Returning home from a long mountain ramble, I saw a poor little newly fledged bird on the roadside, evidently but lately out of the nest; though there was neither hedge nor bush near to account for its being where it was. I took it home with me; but doubting whether I could rear one so young, I looked about to see if I could discover the parent-birds; and soon gladly descried two hedge-sparrows following me, and evidently in a state of great excitement over the collapse of their domestic arrangements. Having heard that if a young bird be placed in a cage where it can be easily seen and heard by the old birds, they will continue to feed it, I placed the little foundling in a cage and hung it on the porch. The heads of the family continued near, but never approached the cage; and as the sun was going down, I was at a loss what to do for the best. After a short consideration, I took the little 'waif and stray,' and holding it so that the father and mother could clearly see it, I walked slowly towards a corn-field—only divided by some hurdles from the garden—and saw that they still followed me, and continued to do so, till I reached my destination. There I held up my protégé for a few minutes well in view, and then quietly placéd

it on the ground, and stood a few paces off awaiting the result. After a short pause, I saw both the old birds fly down to the spot where I had left their newly-recovered treasure; and so the happy family were now reunited.

About a week afterwards I was sitting near a window that opened down to the ground, and hearing an unusually loud twittering of birds in the garden, I feared that something had alarmed them. Close to the veranda I discovered the two hedge-sparrows and their loved one—now strong and able to fly—assembled before me, trying their utmost to attract attention. The old birds were evidently immensely proud of their son and heir. I am perfectly convinced that they were the same trio. It was late in the building season; there had been no nests, to my certain knowledge, immediately round the house; no young birds had been seen near; and in any other case there would in all probability have been more than one hedge-sparrow hatched. Beyond a doubt this was the pleasant termination of the wreck ashore in which I had so willingly come to the rescue. The visit was a thanks-offering for assistance at a time of need. They remained for some minutes triumphantly exhibiting themselves, singing and chirping to the best of their ability; and then all three flew away 'to fresh fields and pastures new.' Thus ended three scenes in the romance of real life.

IN THE WOODS.

The following lines were suggested by the backwardness of the past season. Flowers which in ordinary seasons ought to have bloomed early in May, only made their appearance in June; while in the latter month even primroses might be culled in 'sheltered nooks.'

FEATHERY larches here and there
Tremble in the fragrant air;
Slowly opening, ash-trees green
With half-folded leaves are seen;
May-bloom lingering scarce full-blown,
By its fragrant breath is known.

Spring yet lingers—light leaves fall
From the sweet wild-cherry boughs;
And the poplars slim and tall
Fan with rustling leaves our brows;
In some sheltered nooks that lie
Far from sunlight, you may still
Pluck a primrose, if you will;
And on yonder hedge-bank high,
Golden gorses, late and fair,
Perfume all the sunny air;
While pale hyacinths, out of date,
Sweet and faint their odour spread;
And tall oxlips brown and dead,
For another spring-time wait!

And we hail the Summer gladly,
Though its footsteps seem so slow;
And the flowers of Spring that blow
Thus in June, smile somewhat sadly.
Yet the seasons come and go,
Still obedient to the call
Of the Hand which ruleth all!

THE FREE HOSPITAL SYSTEM.

TWELVE months ago, in an article, 'Mischievous Philanthropy,' we drew attention to the abuses arising from the establishment of free dispensaries and hospitals. We attempted to shew that the lavish way in which these so-called charities were administered tended to demoralise not only the native inhabitants of large cities, but the masses of strangers whom they attracted from distant parts of the country. It was stated on good authority that owing to the drain upon them, twenty-eight hospitals in the metropolis were urgently in want of funds. Since that time, matters have been going from bad to worse. The fact is at length discovered, which might have been found out long ago, that the system of almost indiscriminate admission to the benefits of medical hospitals is wrong in principle; that a large number of patients, probably more than one half, are able to pay something towards the cure of their ailments; and that gratuitous relief, besides imposing an unnecessary burden on the community, is a direct encouragement of improvidence.

The mischief effected in various ways by this kind of wastefulness is evidently dawning on the public. One of the latest demonstrations of dissatisfaction is rather curious. A deputation of medical and other gentlemen waited on the Home Secretary to ask for the appointment of a Royal Commission to inquire into the management of the large hospitals, with a view to a reform in the system complained of. This strikes us as a strange method of trying to reform an abuse which is purely voluntary. If there be a consciousness that the hospitals are badly conducted, let the contributors provide a remedy by simply challenging the rules, and, if need be, stopping the supplies. The government, as far as we can see, has nothing to do with the matter. Should it be desirable to arouse and concentrate public opinion, this could be accomplished by the leading municipal authority placing itself at the head of the movement. Such would naturally occur to any

one out of London. The meeting with the Home Secretary, however, was not thrown away. It evoked a few striking particulars. Among these was the estimate that upwards of a million persons obtained gratuitous hospital relief in London every year. This statement, which was equivalent to saying that one in four of the population were medically pauperised, shewed the great extent to which the abuse had grown. Sir William Gull urged 'that there was great room for inquiry into the hospital management of London, as charity was wasted upon those who should not receive it.' Referring to the out-patient or dispensary system, Sir Charles Trevelyan said: 'The out-patient departments of hospitals were thronged by persons with ailments which might be regarded as certain to come to human nature. The large numbers had grown through hospitals advertising the "numbers relieved;" and it was stated that as many as one million four hundred thousand went to the London hospitals in a year. The system was stimulated by "subscribers' letters;" manufacturers who had put down their names for a five-pound or ten-pound subscription gave their well-paid workmen letters of recommendation to hospitals, and in return got fifty times the value of what they paid. Noblemen and gentlemen at the West End paid a guinea, and sometimes as much as five (a laugh), to an institution; but they sent their highly-paid butlers, housekeepers, and ladies-maids as patients in return.'

In reply to the various speakers, the Home Secretary said he should advise 'the large hospitals to set before themselves the task of remedying the abuses of which the deputation had spoken.' This was common-sense. It is the duty of the hospitals to set about that kind of reform in their management which would check the outlay on patients who are able and perhaps not altogether unwilling to contribute towards the board and medical attendance now offered to them gratuitously. We do not expect, however, that the larger and well-established hospitals will readily concur in ingrafting rules for payment on the old pauperising arrangements. It is generally

out of their way to do so. A more eligible proceeding would consist in organising associations for promoting methods of treatment by regulated annual fees, under the name of Provident Hospitals or Provident Dispensaries. The idea of such a thing will not, of course, meet with the approval of wild philanthropists, whose sole notion of doing good is to give for nothing, and saddle the expenses on voluntary contributories, or on ratepayers.

In this as in some other departments of social economics, the provinces, and even some of the colonial possessions, have got ahead of London. Less governed by routine than the metropolis, they have here and there struck out the idea of organising Provident Dispensaries. Take one or two examples. A correspondent of the *Hampshire Telegraph* wrote as follows, November 1878: 'I have always looked with the greatest interest on the movement to establish Provident Dispensaries throughout the country, and believing it to be one great means for enabling the working classes to obtain medical assistance without in any way pauperising them or lowering their manly independence, wish it the most entire success. I shall be very glad should the Provident Dispensary lately opened at Landport develop into something really worthy of this large town. I will not stop to inquire what may have been the motive which prompted the starting of this Dispensary, but would instead urge those connected with it to consider whether they could not join with the hospital authorities, and elaborate, as at Manchester and some other places, a Provident Dispensary Association, which might benefit the whole place. We want, not one, but half a dozen of these Dispensaries, and the Out-patient Department of the hospital should be, as at Plymouth, the principal of these. Thinking men are more and more convinced that the free out-patient work at hospitals is in reality a great mistake—that it is a charity vastly abused by many who ought to pay a medical man; and it is notorious that, with the best intentions, it is simply impossible for the out-patient physician and surgeons to give that proper attention which each case demands to the crowds which apply for aid. Many remedies have been sought for this, which I will not now enter into; but one of these, which has met with much success, is to change the Out-patient Department into a Provident Dispensary. Is it too much to hope that the question I have raised may be at least discussed by the hospital authorities in conjunction with those interested in the Provident Dispensary just started in Commercial Road? There are many points which would require most careful consideration; but the main conditions of success are: That those only should be permitted to become paying members whose wages are such that they cannot in any other way afford to pay a medical man, and yet who ought to be above being attended gratis. That each member should have the choice of his medical attendant.

That the whole of the medical men of these towns should be consulted, and should have the option of being placed on the staff of the proposed Dispensaries.' Here is the true ring of a thrift-loving anti-pauperising Englishman.

It is interesting to note that a Scottish church mission on Mount Lebanon has besides training the young, successfully introduced a paying medical dispensary. On this subject Dr Carslaw reports as follows: 'The work of the dispensary has been more hopeful during the year 1878 than in the two previous years. The medical treatment has been more appreciated, and the people are now paying willingly for their medicines, and that is saying a great deal for the Syrians.

'The dispensary is open at three o'clock in the afternoon. Each patient comes to the table in turn, has his or her symptoms inquired into, and gets the necessary prescription, which is made up by one of my two assistants. Most of the people now pay full price for their medicines, but there are many cases too poor to pay—these get them free. The most common diseases treated in the dispensary have been fevers, dyspepsia, diarrhoea, dysentery, rheumatism, bronchitis, pneumonia, &c. Fractures have been pretty numerous, and among them were two cases of fractured skull. Wounds, especially of the head and face, were very numerous, caused chiefly by falls upon the sharp rocks and stones so plentiful in Lebanon.'

Perhaps partly owing to the discouragement from the Home Secretary, a conference of several public bodies connected with charities took place in Cannon Street Hotel on the evening of the 21st June, for the purpose of discussing the propriety of establishing a metropolitan association to provide for the ordinary medical treatment of the industrial classes on self-supporting principles, in due relation to the hospitals. We quote as follows from the newspapers. 'There was a large attendance. Mr Stansfeld, M.P., occupied the chair, and was supported by Sir Charles Trevelyan, Mr Holmes, Sir Rutherford Alcock, Canon Clarke, Mr Hamilton Hoare, Dr Fairlie Clarke, and others. Mr Stansfeld, in the course of his opening remarks, said he believed that the time might yet come when parliament might say to itself the only charity, the only system of gratuitous assistance which the law can permit to exist and encourage must be a charity wisely administered, so as not to create pernicious habits of dependence and pauperism, but to make people help themselves. The reforms they were invited to inaugurate could only be established by the determined co-operation of the members of the industrial classes themselves, but they were necessary because the hospital system of London was on the point of breaking down. The strain upon the limited number of the wealthy, charitable, and generous was becoming almost too heavy, and indoor and outdoor relief had become largely indiscriminate. The object the conference had before it was to provide dispensaries all over London, where young but com-

petent medical men could each receive a limited number of patients, act to them as family doctors did to the middle and upper classes, visiting them at their homes, and when they came to very serious cases, referring them to the hospitals with which the dispensaries were affiliated. Sir Charles Trevelyan moved a resolution, seconded by Mr Byne, and carried with only one dissentient, in favour of the establishment of a metropolitan association for the purpose of providing for the ordinary medical treatment of the industrial classes on provident principles, in due relation to the hospitals. Mr Timothy Holmes, St George's Hospital, moved the appointment of a representative committee of fifteen members to prepare rules, to be submitted to a subsequent meeting; which after some discussion was agreed to.'

Here is the promise of something being done in the right direction, though it remains to be seen whether the movement so initiated will be conspicuously successful. The metropolis is difficult to move. We trust that no effort will be spared, through the agency of the press and otherwise, to secure support for the newly formed association. We have likewise some hope that medical practitioners will lend their aid in promoting a Hospital and Dispensary system which shall embrace the principle of paying for medical relief by classes of persons who have hitherto shrunk from their proper obligations. We know no order of professional men who are called on to give so much of their valuable time for nothing, as medical practitioners generally. What they do gratuitously, not only for hospitals but for crowds of outdoor patients who seek their advice, is altogether marvellous. On one occasion, we heard a skilled and kind-hearted medical man say that for his ministrations among persons who were really well off he rarely received any remuneration—that if all who sought and received his advice were to give him only a shilling each, he should realise a thousand a year! In short, the shabbiest shifts, imaginable are resorted to for the purpose of shirking payment to the doctor. On the public at large, therefore, rests the obligation of, in all cases, paying for medicine and medical attendance where practicable. Where there is the misfortune of utter poverty, the dispensation of charitable relief is of course a duty which no one can reasonably challenge.

Possibly, the subject has never been thoroughly pressed on general consideration. London is proud of its hospitals, supported by voluntary contribution. They offer a noble instance of what may be done by private and unobtrusive generosity. The same feeling prevails elsewhere. A large town with incalculable energy manages to build and complete a hospital, or infirmary, on a more than usually grand scale, and points to the vast numbers whom it gratuitously shelters and relieves. Not a thought is given to the fact that as administered it is a gigantic means of pauperisation. Doubtless, while doing much good, and while serviceable to medical science, it evidently has a

demoralising tendency. To be unqualifiedly proud of such an institution, is about as ridiculous as to be proud of having a large and always well-filled prison or workhouse, which in either case should properly be matter for humiliation and regret.

Viewed in the light now brought under notice, the free hospital system clearly stands in need of reform. Without in the slightest degree repressing charitable aid where it is absolutely necessary, and where it is especially needed in cases of emergency, the public, on seeing the matter in its true light, are bound to further any reasonable scheme for lessening the burden of free hospitals and free dispensaries, by establishing processes of payment on a modified scale suitable to the means of the classes who ordinarily depend on hospital assistance. We are aware this may not be a popular advice; but it is at all events consistent with moral and economical principles, and at the present conjuncture is certainly worth thinking of.

W. C.

YOUNG LORD PENRITH.

CHAPTER XLII.—RALPH SWART'S RIDE.

It was the second day after that which had witnessed Sir Lucius Larpent's second and disastrous visit to the Mawth Mill, and towards noon, that the Black Miller rode clattering into the stony streets of Treport. He put up his horse at a small inn frequented by farmers from the country round, and strode off on foot, choosing such thoroughfares as were the loneliest, and making his way towards a remote part of the little seaport town. He had an appointment to keep. On the previous day he had himself posted at Tregunnow a letter which was to give notice to the person with whom he desired to confer to be in readiness at the trying-place he had selected. And from what he knew of Salem Jackson, he had little doubt but that the Americanised Cornishman would readily fall in with his views.

It was a wet, wild day. Fierce gusts of wind, chasing before them, like hunted creatures, the blurred and ragged masses of the clouds, swept at intervals over land and sea, and heavy showers succeeded to them; while those who were reputed weather-wise predicted a coming storm that should play havoc with farm-stock and shipping alike. As it was, the bad weather of the last two weeks had deluged the low-lying lands, and converted brooks into rivers, and trickling rills into brooks. The mill-stream at Pen Mawth was so swollen that the mill had ceased working, and labourers had been employed during the whole of the preceding day in repairing the dam and strengthening the sluice. But in the morning the Black Miller had risen early, had prepared his own rude breakfast, and saddled his own horse, and ridden slowly off through the dim light of the wintry dawn, locking the door of his house, and marking it with a broad cross in chalk, by which token the hind who acted as his servant would learn that for that day his customary household duties need not be discharged.

Ralph Swart had but seldom been in Treport, some five or six times perhaps, during the many years of his residence at Pen Mawth. But he was one of those men whose powers of observation are quick, and their memory for localities tenacious. Few natives of the little coast-town, Treporters

born and bred, could have found their way more unerringly among the devious by-ways, the stairs, and alleys that intersected the outskirts of the place, than did the dangerous tenant of the Mawth Mill. And at last he reached the spot which he had selected as the scene of his conference with the kindred spirit whom he had chosen to aid him in his dark designs. Nothing would have been easier than to have arranged for an interview in a private parlour of some tavern or inn. But the Black Miller preferred, like the Douglas of old, rather to hear the lark sing than the mouse squeak, and mistrusted partitions and doors, as convenient hiding-places for surreptitious eaves-droppers.

It has been mentioned that there was a lane, winding upwards between high banks, and which furnished the shortest path, although steep and rugged, from the beach to the environs of Llosthuel Court. It was up this lane, the lower end of which almost skirted old Captain Trawl's garden hedge, that Hugh Ashton had wended his way when, before quitting Treport, he sought one parting look at Maud's windows, from beyond the fence of Lady Larpent's rose-garden. A quieter spot than this, or one in which conversation was less liable to interruption, could not easily have been found so near Treport; for the dwellings bordering on the lane occurred only at rare intervals, and the foot-passengers who traversed it were rarer still.

It so happened that Rose Trawl, a little basket on her arm, came tripping lightly down this winding lane, returning from some household errand, when suddenly, as she was about to turn an angle of the rocky road, she heard what made her stop as abruptly as if by magic art her feet had become rooted to the ground. The words she heard were: 'This Hugh Ashton, fine fellow as they think him, will get the worst of it for once, ho, ho! the worst of it for once!' The speech was ambiguous; but there was that in the deep, hoarse voice that uttered it which made Rose Trawl's heart almost cease to beat, so fraught did it seem with malice and menace.

'He can't get worse than *I* wish him,' said another voice, higher and shriller, and which Rose fancied that she had heard before. 'Confound him! if this had been New Orleans instead of Treport, I'd have settled scores with him long ago, for getting me sacked from the steamer. But bowie-knives don't pay, in this benighted old island, boss!'

Rose rallied all her courage, and, herself unseen, peering cautiously round the cover of the rock, saw the two men to a portion of whose conversation she had listened. One was a stranger, a large-made, powerful man of middle age, with a dark, stern face, booted and spurred, and with a heavy whip under his arm. He held a written paper in his hand, which the other, who was dressed as a seaman, and in whom Rose recognised Salem Jackson the mutineer, was in the act of receiving from him. One glimpse was enough, and then the girl cowered down behind the rock, like a hare in its form. Would they murder her, this pair of evil companions, if they detected her in the act of listening to the details of the wicked plot against her good friend and former guest, Hugh Ashton? It seemed not unlikely; but then had not Providence sent her there to frustrate the conspiracy, and should she not be brought un-

harmed out of the peril of the moment! She held her breath, and waited to hear more.

'This is better than bowie-knives!' said the tall dark man, authoritatively. 'Do not lose this paper, with the address of the inn at Bullbury, and let us consider it a bargain. The contents of the cash-box are your perquisite. The hundred pounds you shall have as soon as you have earned them by bringing about the ruin of the man you hate. Let me know for certain that Hugh Ashton has left Hollow Oak Station with iron bracelets round his wrists, a disgraced man for life, and you shall have the sum I mentioned, all in gold. Here are five sovereigns for expenses.' And the money clinked as it was put into the sailor's ready palm.

'All right, Ralph Swart!' exclaimed Salem Jackson joyfully. 'A bargain it is. But I can tell you, Mr Swart, or Grewler, I don't do it as much for the yellow shiners, as to be revenged on that coxcomb of a Captain, forsooth! And a fine vengeance too!'

'Ay, and safe!' muttered his confederate, in a tone of ill-disguised contempt. 'Drop me a line at Pen Mawth Mill, near Tregunnow Churchtown, to say when the job is done.'

And then, to Rose's inexpressible relief, the two voices and the footsteps of the speakers died away gradually in the distance. But although the rain, which had set in again, beat heavily upon her crouching form, the girl did not dare to rise and continue her homeward route until many minutes had elapsed.

Meanwhile the Black Miller, having parted with his accomplice, made his way in the same circuitous fashion as that which he had previously adopted, back to the inn where he had left his horse. He dined alone, eating voraciously, as was his wont, and drank deeply afterwards, chuckling to himself, as he sat at his solitary table, his hat drawn down over his massive brows, and a glass of stiff grog before him, while the storm increased, and the short-lived daylight waned. Then he called for his bill, and ordered his horse.

'A rough, wild night, squire,' said the wondering hostler, as he brought round the horse to the inn-door.

'Who cares!' answered Ralph Swart with an oath, as he swung himself into the saddle, and clattered up the street, and out into the open country.

A wild night it was, and a toilsome ride that lay before him. The shrieking wind swept by with furious force, and the blinding rain fell in such sheets, and with such violence, that it was hard to make head against it. The horse the Black Miller rode, a thorough-bred, purchased cheaply from Sir Lucius Larpent, and always vicious tempered, reared and swerved in a manner that would have unseated an average horseman. Again and again did the terrified horse refuse to face the storm, and each time his rider forced him on, at a hand-gallop, in the teeth of howling wind and driving rain. The tempest seemed to gain in strength as Ralph Swart left Treport and the coast behind, and crossed the moorlands, rolling far away inland. The very road was like a lake, while great pools of water had collected in the lower fields, and still the rain fell, and still the wind rushed by with a sound like the cry of wolves clamorous for their prey.

Strangely enough, the spirits of the Black Miller seemed to rise as he confronted the fury of the storm. He sang snatches of old half-forgotten songs, and laughed with a grim enjoyment of the tumult of the elements, and of his own iron nerves and iron frame, that rendered him indifferent to all. The snorting horse in vain tried to break from the control of the rider, in vain plunged and reared, swerving across the flooded road, and straining at the bit. Ralph Swart merely laughed, and spurred on, firm in his saddle, as though he had been a centaur indeed.

Presently the landscape grew more familiar. To the left were a few scattered lights, that must proceed from the windows of Tregunnow Churchtown. To the right, dimly descried through the shadows of night, rose an ungainly black mass, that could be no other than the Hill of Death, looming far over the dismal landscape that it crowned. Near the road were strewn rubbish-heaps uncounted, piled up, as Ralph Swart well knew, near the yawning mouth of many a worked-out mine. It was with a sort of chuckle of self-congratulation that he remembered the visit of Sir Lucius, and how it ended. He had done that day another stroke of business, had blighted—so he hoped—the life of one who had indeed harmed him in nothing, but whose existence was to him a standing source of danger. What cared he for wet or mire, or the toil of the long ride! His jaded horse went quietly enough beneath him now.

How loud was the roar of the mill-stream, as it rushed, torrent-like, down the ghastly ravine, topped by frowning crags, in which his mill was built! But here was the mill itself now, and his journey was over. Dismounting, Ralph Swart led his weary horse into the shed that did duty for a stable, unsaddled it, and, replacing the bridle by a halter, tossed a measure of corn into the manger, and shook down some marsh-hay into the clumsy rack. Then, carrying the stable lantern, which it had been his first care to light, in his hand, he shut the door of the shed, and entered his own house, the door of which he locked, barred, and bolted with his usual jealous care. How loud was the roar of the mill-stream as it rushed, washing and gurgling among the stones hard by! Never had the Black Miller heard it sound so portentous during all the years of his tenancy of the Mill of Death.

CHAPTER XLIII.—ROSE WRITES TO MAUD.

Rose Trawl's very natural terror, so long as she ran the risk of being discovered in her hiding-place behind the rock by those with regard to whom she had involuntarily played the part of a spy, gave place, so soon as she had gained the security of her own home, to an equally natural indignation. She trembled now, not for herself, but for gallant Hugh Ashton, knowing, as she did, that the very frankness of the young man's generous nature was likely to render it the more easy for his enemies to insnare him to his ruin. That the pair of conspirators whose talk she had overheard were not likely to be restrained by any scruples, she could well believe. Salem Jackson bore but an indifferent character in his native place, and although reputed more untrustworthy than truculent, was known to have uttered threats

at the bar of more than one public-house against his former Captain.

By far the most dangerous of Hugh's unsuspected foes, so Rose deemed, was the Black Miller. That shrewd, massive face, swarthy as that of a Spaniard, and lit up by those baleful eyes, was not readily to be forgotten. Ralph Swart was one of those men whose daring it is impossible for the most casual observer to doubt, and whose strength and cunning would forbid the boldest to despise their enmity. Hugh must be warned. Hugh must be saved. But how? Rose could not venture to tell her ailing grandfather, whose health had lately altered for the worse, what she had overheard. 'He should be kept quiet,' the doctor had said; and besides, the old sea-captain, as unsuspecting as a child by temperament and habit, was by no means the sort of counsellor in such a strait as this.

Lady Larpent was the personage whose image next rose up in poor Rose's bewildered imagination; but there were two reasons why an appeal to the strong-willed Lady of Llosthuel seemed to be out of the question. It had filtered round somehow, through small tradesfolk and through the servants at the Court, that the Dowager's early liking and esteem for Hugh Ashton had changed, for some inexplicable reason, into frigid disapprobation. And then Lady Larpent was known to be in trouble just then, concerning the unaccountable disappearance of her eldest son, Sir Lucius, relating to whom all manner of vague and alarming reports were in circulation. To whom, then, could Rose turn, save to her betrothed husband, Will Farleigh! But the young ornithologist was absent just then, on one of his professional rambles in search of rare specimens that would be acceptable to collectors; and a day, and the better part of another, were thus unavoidably lost.

When Will Farleigh did come back, and heard his sweetheart's story, pretty Rose had no need to complain of the lack of sympathy. That Hugh Ashton—dear, brave Hugh—the man who had saved his life, and whose friendship he felt to be an honour, should be threatened by hidden foes, with some cowardly vengeance half explained, was enough to awaken every manly impulse in the bird-hunter's nature.

'Swart—Ralph Swart—and Pen Mawth Mill—you are quite sure of those names, Rose dear?'

Yes; Rose was quite sure.

'Well,' said Will thoughtfully, 'I have heard tell in the country, inland, of such a mill, and of such a man, and never heard any good of either. But did not the other scamp, Salem Jackson, call this Swart by another name—I did not catch that?'

Yes; Rose was certain that she had heard the Black Miller addressed by two names. One was Swart. The other was Grewler.

'But then, what do they intend to do? It can't be murder, because of what was said about iron bracelets!' said Will, staring hard at a beam which spanned the ceiling, as if he hoped to find an explanation written there.

'Salem Jackson did talk of bowie-knives!' said Rose gravely.

'But Salem Jackson's more brag than do!' returned her affianced one. 'He's but a coward, slippery as he is. I happened to hear him, a fort-

night ago, abusing Captain Hugh at the *Blue Anchor*, and I promised him a set of aching bones if he dared breathe a word against a man whose little finger was worth Salem's whole body. He was the bigger of the two, but he only looked black, and slunk out. No; if he does mischief, it'll be by stealth, and in a sneaking way, as suits him.'

'But the other—that Swart, or whatever he is—he looked wicked, but bold as a black lion!' objected Rose.

'Ay, that, if all tales be true, is a bird of another hackle!' answered her lover meditatively. 'But then, Rose, as luck will have it, your black lion does not seem to care to go to Dorsetshire himself, but prefers to send out his skulking jackal, as I've read that lions do at times, to do his dirty work for him. What are we to do? is the question. Captain Hugh's so open and fearless, it would be useless to caution him. Stop! You know Miss Maud there—at her uncle's fine house at Alfringham, close by—she always was kind to you—and she should be kind to Hugh, that saved her from drowning in Wales yonder. Can't you write to Miss Maud, and I'll carry the letter?'

Rose looked aghast at first, partly at the proposal that she should write a letter, diffident as she felt of her own powers as a correspondent, and partly at the idea of addressing, with pen and ink, a lady by birth, and an heiress.

'Very kind she always was—but I've not often spoken to her, Will, not above half-a-dozen times!' said the girl shyly.

However, for Hugh's sake, and with Will's help, the letter was written. Here it is:

HONOURED MISS MAUD—Excuse the liberty I take—Will Farleigh, who, as Lady Larpent knows, is to be married to me as soon as we are Rich enough—will carry this letter himself, all the long way from Cornwall to my lord your Uncle's grand home in Dorsetshire—but I am drove to intrude by the Peril of one respected and Liked by us all. I am no great scholar, nor clever with my Pen, but sooner than Harm should come to Captain Hugh Ashton, to whom all Owe so much, he being the brave good young man we all know him to be, I would walk every step of the road, if needed, to say how Wicked men have plotted his Ruin. Which William Farleigh, who takes this, will explain, and how by the Lord's mercy I was enabled to overhear bad people—names of Salem Jackson, which, for our shame, he is a Cornishman, and sailor here, and Ralph Swart—or Grewler—called the Black Miller of Pen Mawth, Tregunnow Churchtown, talking how to do our friend hurt, and bring Disgrace to him that deserves so well of All. I hope my Lord Penrith is quite well. I hope Mrs Stanhope is quite well. And, with best respects, no more now from your grateful servant,

ROSE TRAWL.

For God's sake, get my lord to protect Captain Hugh.

TREPORT, December 29, 18—.

With this letter, Will Farleigh, with Rose's savings in his pocket, to eke out his own meagre ones, started by the night-train from the nearest station, to which, for time-saving, he hired a gig from the same inn at which the Black Miller had put up his horse, and travelled all night. The

morning was well advanced before, walking from Stedham Station, at which, it being a larger place, more trains stopped than at Hollow Oak, the traveller had alighted, Will came in sight of the stately pile of Alfringham. Now, there was really no particular reason why Rose's affianced husband should not have rung the door-bell, stated his name and whence he came, and obtained an interview with Miss Stanhope. But he thought there was; and Rose had been strongly of opinion that he must approach Miss Maud secretly, and deliver his credentials in quite a mysterious fashion. And, when he saw how very big and splendid was Lord Penrith's mansion, Will's heart failed him a little, and he began to think that the hardest part of his task yet lay before him.

To deliver a letter privately, even for the best of motives, to a young lady of high degree, dwelling beneath the roof of such a relative as was the noble master of Alfringham, is no easy matter. Figaro or Scapin might manage it, by some display of practised impudence; but otherwise it is hard indeed. However, fortune befriended the young bird-stuffer, in that he met Miss Stanhope in the park, and close to the garden gate, and alone. Will introduced himself promptly enough, putting the letter forward, however, and keeping himself in the background to the utmost of his power, precisely as Rose, in her awe of a social superior, had thrown the onus of explanation on Will.

Miss Stanhope read the letter with an agitation of manner which surprised the young Cornishman, but was much perplexed by its contents. Plots and conspiracies were things so foreign to the world in which she had lived, a world of decorous observances and of conventional propriety, that she seemed bewildered, until Will's almost verbatim account of the conversation which Rose Trawl had overheard convinced her of the danger that menaced Hugh.

Then Maud read the letter of her humble friend once more, and this time understood it. Now she could see the peril, undefined and shadowy; but not on that account the less to be dreaded, that impended over him she loved. And, in the fear of losing him, in her natural womanly anxiety for his safety, she all but forgot the tacit lesson that she had learned through life, the pride of her superior station. For an instant she forgot that Hugh was but a poor fisherman, who, by gallant efforts, and by the force of a character singularly noble, pure, and strong, was winning his way upwards in the world. For an instant she forgot that she was a lady, and only remembered that she was a girl that loved.

'You are Hugh's friend!' she exclaimed, putting her hand on Will's arm; 'and you owe him, as I do, a life. Help him now, dear Mr Farleigh; for my poor help, which sweet Rose has written, ah! so prettily, to ask, avails little now. My uncle—Lord Penrith—is ill and old, and since the late accident on the railway—brave Hugh again! always foremost when good deeds are done—passes half the day in lethargic sleep. Go and warn him, good friend! Warn Captain Ashton that traitors are plotting—not his death—who dares meet him, face to face!—but some cruel scheme, to which his own guileless confidence may—O warn him, tell him what you have told me—and—and if you will come to the Hall and tell me that all is

well, I will bless dear Rose Trawl and you for the good deed done.'

So Will Farleigh set off for Hollow Oak Station, while Maud went back to her room to pray for him she loved.

HOME-LIFE OF THE ZULUS.

IN the present state of our relations with this people, the following sketch of their social life, their domestic manners and customs, compiled from the most recent books on South Africa, may be of interest to our readers.

Zulu history, in the few words we need devote to it, begins about two years before Waterloo, when King Chaka became chief of the petty tribe which by his military genius he raised into a large and powerful nation. Chaka while a lad in exile had heard from some English sailors of the exploits of the great Napoleon, and this had fired his ambition to become the Napoleon of South Africa. By great military genius and consummate statecraft he succeeded in his purpose, and in a few years became king of a new and large but compact and rigidly governed nation of warriors.

Under Chaka the whole manhood of the fast-growing Zulu nation was put under compulsory military service, and this has continued to be the law of the country under the three kings—Dingaan, Panda, and Ketchwayo—who succeeded him. This unique army of at least fifty thousand fighting-men is divided into regiments, each having its own military kraal or headquarters. Some of these regiments are composed of married men, others of bachelors; but no man is allowed to marry without the express sanction of the king, which is granted to whole regiments at once, but almost never until the men are past middle age, and have 'washed their spears' in an enemy's blood. Nor can the middle-aged Zulu even then exercise much choice in the selection of his bride, as the king, at the great annual festival when marriages take place, simply orders one regiment to take for wives the daughters of men composing other regiments of his army. If the maidens so chosen refuse to marry at the king's order, and especially if they are detected in love-affairs with men too young to marry, their punishment by the stern Zulu law is death.

The military kraals of each regiment are the villages of Zululand, and it is to them we must go to see the home-life of the people. These kraals consist of a large field, surrounded by a circular stockade about ten feet high, constructed of wattles firmly twisted together. Inside this fence are the huts of the natives, which are built by fixing in the ground a number of pliant poles in a circle, and then bringing their points together at the summit, and fastening them with ropes of hide. These poles, however, do not go up parallel to one another, but cross each other obliquely at regular intervals; and as the intersecting points are firmly tied together, the beehive-shaped huts have all the strength of basket-work; while stout posts driven deeply into the earth at the base give them additional security. The walls outside and in are daubed over with clay; and the

floor is also composed of clay, stamped down hard and polished by friction. The Zulu hut, Captain Lucas tells us in his recent work, 'is not at all an uncomfortable or unsightly dwelling, though affording but a single room for the accommodation of the family.' A partition of wattles, however, divides the interior of a married man's hut into two parts, of which the left-hand room, as one opens the door of wattles, is given over to the women and children, while the other apartment is reserved to the master of the house and his male companions. In each compartment are kept the personal chattels of its occupants: in the man's, his assegais, his shield and rifle, with his uniform of plumes, cow-tails, and apron of wild-cat skin; while the women, besides their simple finery of gala dress, keep the pots of milk, the stores of grain, and the cooking utensils; and under the raised platform on which they sit the Zulu herdsman shelters his precious lambs and calves from the inclemency of the weather.

The kraals of unmarried regiments differ to this extent from the others, that they are each under the immediate care of an 'induna' or chief, who strictly looks after the men and provides for their maintenance. In a corner of the inclosure, away from the huts, in each of which eight or ten bachelor inmates are housed, is an inner stockade, behind which is the Zulu colonel's 'isogodhlo' or domestic establishment, the houses of his wives, and the huts of his slaves; while in the centre of the great inclosure is his cattle-pen.

Cattle form the only riches of the Zulu; these are the only medium of exchange, and the only means of acquiring power and getting wives. Polygamy is universal; and whenever a man gets leave to marry, the only limit to the number of wives he can take is his power of buying and maintaining them. Each wife costs so many cattle to buy, and for each wife so bought the husband must provide a separate hut; so if a man is wealthy he may continue adding new wives to his household to the end of his days. This has brought about the deplorable state of matters that the more daughters a man has the wealthier he becomes, as daughters are readily available as so much stock for sale to the would-be husband who bids the most cattle for them.

Thus females are little better than slaves; and to them falls the task of digging and hoeing the fields, sowing and reaping the maize-crops, grinding the corn, weaving mats, and most of the other simple industrial labours of the country. Now and then an obliging young man may condescend to help in sowing and harvesting grain; but in no other labour will they help the women; while again there are certain departments of work which are exclusively confined to men, and in which the women dare not engage. It is not surprising to find that three of these are hut-building, the construction of fenced kraals, and the making of weapons; but the fourth is very strange. This is the task of milking cows, 'which,' says Captain Lucas, 'is esteemed rather as a kind of recreation, the practice being to suck the cow's udder with the mouth, and to discharge the milk by mouthfuls into the pail.'

The food of the Zulus is simple, and consists of millet, 'mealies' or maize, and milk, with now and then beef and mutton from their herds. Grain, however, is their staple; and this simplicity

of their commissariat arrangements is one of the great advantages the hardy and lightly equipped Zulu armies have over a British army with all its complicated array of baggage-wagons. A Zulu 'impi' on the war-path is followed by a company of lads, who bear a few days' supply of maize, the sleeping mats and blankets of the warriors, and who assist in driving a small herd of cattle, proportionate to the time the particular expedition is expected to last.

The great national festival of the Zulu year is the U-kwischwana or harvest thanksgiving on the first of January for the crop of maize, which now lies ripe for gathering. All the regiments appear at it, and are exercised and reviewed by the king, who at this festival grants permission to certain old soldiers to retire from military service, and to others to marry. The king then proceeds to perform certain sacrificial rites to their gods, who are the souls of Chaka and other deceased monarchs and heroes, authors of Zulu glory and greatness. Bulls are sacrificed to them, and they are implored to continue sending bountiful harvests, 'that the soldiers may eat and be strong for the noble work of war.' There are no regular temples in Zululand, nor any stated ordinances of public prayer, except at this harvest thanksgiving, and other similar festivals of the year, at which the king, as arch-pontiff, takes the leading part. 'It is evident,' says Captain Lucas, 'that whatever gods the Zulus may have in their own country, they have plenty of devils, and there is perhaps not much to choose between them.' Witchcraft is firmly believed in; and whenever this terrible charge is brought against any man, no matter how blameless his conduct had hitherto been, no mercy is shewn him; and his treatment recalls that dark page that stained our own history not so long ago. This gross superstition affords a ready pretext to king or chief in Zululand for destroying an obnoxious person, or acquiring the wealth of a rich man whose teeming cattle-kraal may have excited their cupidity. The 'inyanga' or witch-finder soon makes out a case against any such unfortunate; and his lands, herds, and women become forfeit to the king or other instigator of the 'inyanga's' accusation.

The ordinary administration of justice by the local chiefs is conducted in a form not very unlike our trial by jury. Plaintiff and defendant, accompanied each by a band of sympathising friends, approach the seat of justice—set up in the middle of the kraal—from opposite directions, shouting out the cause of complaint and the pleas in justification. When they reach the judge, these are stated in a quieter manner: a jury is formed of the notables of the kraal, who examine the witnesses, listen to the speeches of any of the bystanders, and pronounce their opinions how the verdict should go. All this time the 'induna' says not a word, sometimes, even, he lies down and appears to go to sleep; but when he has heard the popular verdict or verdicts, he retires for a little to consult the divine oracles, and then returns to pronounce his judgment, which generally agrees with that of the majority of the jurymen, who, however, are apt to fall in with the popular opinion shouted out by the crowd standing at a little distance from them.

Captain Lucas assures us that, except for the

curious 'click' sounds, which after all are not of frequent occurrence, 'the ordinary flow of Zulu talk is as liquid and melodious as that of Italian.'

A PICTURE-DEALER'S ROMANCE.

I.

I, JOHN GILDERN, was confidential clerk to Messrs Copal and Sons, picture-dealers near Oxford Street, London, long ago when these events happened; and the firm of Gildern and Co., that now passes pictures worth thousands through its hands, was not then even a dream of mine.

I thread my way back through the maze and confusion of a busy life to those unforgotten days, and one picture rises before me, real, living, all but substantial in my memory—the one picture that has haunted me through all these years, and that all the gold that ever was coined could not purchase, nor all the power of man give back again to my bodily sight. A young English girl, not tall or queenly, not lofty in looks, but straight and graceful and very fair; a face with clear-cut features, wearing yet the looks of a child; blue eyes, looking upward, with their dark fringes raised; eyes of the softest grayish blue, not bright, unskilled in any artfulness of glance, not fine with any artistic correctness of form; but eyes that were supremely beautiful in that rapt upward look, because they told of a child's unconscious simplicity, of a true heart's open candour, of a pure soul that in every-day life and among every-day things was bright enough to make its presence known. This is the picture in my mind. Marian standing on the door-step of a manor-house watching the floating clouds in the autumn sky. It was a picture of ordinary things with an inner depth of beauty. The accessories were commonplace enough. There was a white pavement before this side-door, some ivy on the wall, and all within was dark. The fair figure thus framed was dressed in some poor cotton stuff of pale-blue and white lines that ran into one soft colour. The lustrous brown hair with only a few golden threads where it sprang straight upward from the forehead, was plaited and hung in braids, as was the custom once before in those old days; and the hat with ivy leaves thrust under its band of pale blue, was pushed back, and cast no shadow on that never-to-be-forgotten face.

I, plain John Gildern, was in the most unromantic of moods, when turning out of the path from the side-gate by which I had entered, I came upon this sight. I presented the appearance of the most ordinary man of thirty, such as may be seen any day in London banks or offices in scores. I had come to the house merely on business, with no introduction to the family; but I carried a carpet-bag—a necessary appurtenance of the traveller in those days—and I was invited to stay in the house till my business was done, for it was expected to be troublesome and lengthy work—the drawing up of an accurate catalogue of the names and value of a galleryful of pictures, which the master of this place desired to sell to our firm. At my approach the girl stepped out

of the door-way into the garden, and I saw no more of her that day.

An old gentleman, careworn and, as it seemed to me, not too amiable in appearance or manner, received me in a room full of books and papers. When the servant, a shabby-looking individual with threadbare livery, ushered me into his presence, he was bending over the table looking at some stones and coloured earth through a glass that he held in a thin, palsied hand. He drew a newspaper hurriedly over his treasures, and without asking me to be seated, made his inquiries in a proud slow voice. Was I from Messrs Copal and Sons? I was. Had I come to examine the pictures as their agent? Yes; I had come to do that service. Then, he said, holding himself straight all the time, and with a pitiable artifice of display, smoothing back his thin gray hair with the shaking hand, whereon glittered a great diamond—then I would find my room made ready; and I was free to stay at Elmsmere as long as my work lasted, for Messrs Copal had given him to understand that it was sometimes a tedious operation to catalogue and do justice to so many pictures of all degrees of merit. He explained that he was a lover not of art but of study—waving his hand towards the book-shelves. He never went near the picture-gallery, and desiring retirement, he chose to ask but few to his house; so he was anxious to clear off the whole art collection—‘all,’ he said, ‘every one of them;’ and with a sudden betrayal of anxiety despite his proud demeanour: ‘I am sure sir, Messrs Copal have sent a competent agent who will do my property justice. You can have them all, every one, mind; and I know such a house as yours gives a good price. Now sir, the servants will attend to your wants.’

With that he bowed me out; and the shabby serving-man went before me along the passage, with slippers down at heel and stooping gait; a living satire upon the last order of the poor broken-down gentleman. Such indeed was his master! I knew it as well as if he had shewn me his files of bills and his mortgage papers and the blank credit side of the accounts of Elmsmere. His diamond ring, his cold ceremony, and his erect post braving fortune, did not deceive me; but I must say for the credit of me, John Gildern the clerk, that I quitted his presence as I would have quitted that of a millionaire; for respect was commanded by this remnant of a grand family struggling against ill-fortune, and being, as the phrase goes, ‘out of luck.’

My work began, and was not easily ended. There were but few paintings of value, though there were many having traditions of great names attached to them, which a close examination proved to be groundless; for these were generally but copies, or works ‘in the manner of’ Van Eyck or De Wint, as the case might be. There were, however, some really good Dutch pictures, a beautiful but ill-preserved *Madonna* of the Tuscan school, and a Rubens that sorely puzzled me, but which, as the event proved, turned out to be genuine. The main bulk of the collection were family portraits, worth little more than their frames. It was clear from the names of these that the family was related to a knightly one; but this branch bore no title. There was a veritable Stuart court-lady by Lely among the rubbish; and

there were two pretty children with unkempt hair, great brown eyes, and pointed chins, purporting to be from the pencil of Sir Joshua Reynolds. There is no need to describe, nor can I at this day remember, all the pictures of that miscellaneous collection. But amongst these hundreds of bright or old and discoloured canvases, there was one that attracted my attention, and it was only a little thing, no more than eighteen by twenty inches in size. This was the portrait of a fair young woman among vine-leaves at a window. She was dressed in white silk, adorned with jewels, and with strings of large pearls round her neck. Her hands were raised and clasped as if in some enraptured gesture, her blue eyes cast upwards. And though the dress was so different, and the attitude of the hands was tragic and what we commonly call ‘stagey,’ I had no difficulty in detecting a striking likeness between those fair, refined, spiritual features and the girl I had seen standing at the door. In the corner of the picture there was an awkward smear of paint. ‘That conceals the artist’s name,’ I thought; and I soon carefully removed it. But beneath there was only scratched in small white letters, ‘My Juliet’—two words which cast no light upon my business, but awakened my curiosity to a painful degree. On the back was a date twenty years before.

My work soon put the discovery out of my head. I saw no one all day except the slipshod serving-man; and after a lonely evening, he came with a guttering candle to light me up-stairs to a large bare room, filled with the smoke of an unwonted fire. It was a room with faded hangings, seedy pictures, a tiled hearth-place, and shadowy half-lit walls. Any one nervously inclined would have imagined not one but half-a-dozen ghosts there. I was haunted by nothing but the memory of the girl at the door, and the mystery of the portrait with its obliterated name, ‘My Juliet.’

II.

All next day I worked alone, the rain pattering against the high narrow windows of the gallery. Many of the family portraits I omitted from my last list as not saleable, and various other pictures I set down as ‘doubtful,’ not being able without consultation to settle the question of their authenticity; but the little painting of the girl in white silk at the window was so exquisite in feeling, in colour, and in minute finish, that I had no hesitation about placing it in my list. It was about sunset when the light in the gallery was strong and clear in a dry hour after the rain, that as I knelt deciphering some artist’s marks on a little Dutch sea-piece hung badly near the floor, I heard a light footfall, and looking up, I beheld a slight girlish figure treading with little slippered feet on the dark oak floor. I rose and bowed. It was the girl of whom I had wished vainly all day and all last evening to catch another glimpse. I rightly guessed that she was my host’s granddaughter, and I was not free from an embarrassing flutter of heart when she came to speak to me; but I supposed it would be some message from the old man, nothing more.

The girl drew near and began to speak, with eyes not downcast, but like a child’s eyes, raised steadily to mine, with a look that was at once the soul of innocence and maidenly gentleness. ‘I

want to ask you,' she said, 'is that picture to be sold among the rest?' The picture she pointed to was that which had roused my curiosity the evening before.

Yes, I said; it was on my list. The instructions received were to the effect that all were to be sold; and though there were some of the larger portraits that I could not take, this picture was of value.

Never shall I forget the effect of these words—the nervous trembling of the girl's lip and the liquid look in the blue eyes. 'Sir,' she said, addressing me in that way because she knew nothing of latter-day customs, and was making an urgent appeal—'Sir, it is my mother's portrait. Grandfather does not care for it; but oh! I do. It is no use for me to ask it of him, he thought so little of her. But will you ask him, and have it kept for me?'

'Most assuredly I will,' said I, looking down at the earnest face, which it would have taken a harder and a more unchivalrous heart than John Gildern's to refuse. 'I am certain there will be no difficulty about having it left out of the list.'

'I am not so sure of that,' she said, smiling and shaking her head. 'Grandfather has such strange ideas sometimes, and he keeps so to whatever he once says.'

'Other people do that too,' I replied assuringly. 'I shall keep to what I have said, and see that the picture remains here.'

With her sweet voice she thanked me, and went away, leaving poor John Gildern standing still, note-book in hand, calling to mind every word that had passed, like any romantic swain of twenty, wondering if he would see her again, and through sheer anxiety, fancying every word of his own had been awkwardly and stupidly uttered.

When the servant summoned me to my solitary dinner, and took his place behind my chair in the deserted dining-room, full of faded grandeur, I could no longer resist the temptation to find out something about the family, or rather—need I conceal it!—about my charming little maid.

'It is rather tedious work for me here,' I said as a beginning, my preoccupation causing me to make such spluttering failures in dismembering a duck, that I knew the shabby-coated old man was grinning behind my shoulder. 'Family portraits are such useless things unless they are by a man of note, and there are some of the pictures that I know nothing about. For instance, there is a little thing of a lady in white silk at a window, and there is something interesting about it; but it has not even an artist's name.' I knew I was not wasting my words. This servant had evidently grown gray in the family; most likely there was not an inch of the house unknown to him.

'Ah! yes—ah, yes, yes!' he said, speaking in low husky tones, and clearly making a bad copy of his master's air of importance. 'There's a secret about that pictur'; 'tain't no common affair, not it.'

'Well,' I said, 'if you can assist me in any way that is valuable in my business, I shall of course consider your services.' All is fair in love and war, they say, and I could not resist the desire to satisfy my curiosity.

'Much obleeged to you, sir,' said the husky

old man with a bow of great dignity, as he forthwith proceeded to relate the history of the mysterious picture.

The facts I afterwards put together were these. There had long ago been a coldness, almost a feud between the owner of Elmsmere and his only son. The cause of this was the attachment existing between the son and a beautiful and virtuous girl, who was then on the boards at a provincial theatre. The delay to the marriage was caused by the father's threats of disinheriting the offender. But at last that difficulty was surmounted; a consent was wrested from the old man; the marriage took place; and the bride, bidding farewell to the stage, was brought home to Elmsmere. Her husband, the heir of the mansion, had dabbled a good deal in art. He painted his wife as Juliet, the part in which he had first seen her; and he insisted on hanging the portrait with the rest in the gallery. He met with a fatal accident not long after the marriage; and the father, for love of his wilful son, let the small portrait hang where he had placed it, but with his own hand blotted out the words in the corner—'My Juliet.' The young wife did not long outlive her sudden loss; and the old man was never reconciled to her, although, as the servant said, 'she was the gentlest, most heavenliest bein', sir, that ever drew breath.' But when, in dying, she left an infant daughter, the father's heart warmed to the child, and for his son's sake she became to him the one dear thing on earth. This was the whole story—a sad one enough. My interest in it only made the servant more communicative.

'Master will want to see you to-night, sir, as the business is done,' he said; 'and don't you mind, sir, if you find him nervous a bit—or hot, as I may say. It's his way, sir. The world's gone askew with him this long time back; and there's always a mine or some such nonsense just a-goin' for to be found on the estate, and not bein' found after all, and edging his temper, poor gentleman!'

The old man was evidently glad of some one to talk to; but when he verged on his master's present affairs, I stopped him; and dinner being finished, sent him with a message to my host to ask if he was at leisure to see me. He sent back word that he was engaged on most important business, but he would see me in half an hour. When the summons to the library came at last, it was easy enough to see that the 'most important business' had something to do with plans on the table, which were stained by late contact with clay or dusty stones. This much I could not help observing, as the plans lay on the table, and the old man held something in his hand, which dropped reddish earth on the floor when he stretched it towards me in an impatient gesture. I gave him a rough estimate of the value of his pictures subject to changes, for better or worse, which might be made in it by my employers. I offered him his option of doing business in this way, or of having the whole collection disposed of on his own account for what it would bring at our salerooms. He said he preferred ready-money transactions with the firm for the purchaser, but the figure I named was much too low. He went over the list with me, and waxed, as the servant had predicted, rather hot on seeing some of the prices, and hotter still at my inability even to take into

consideration the purchase of many of the portraits. He was only pacified, when he was absolutely losing his self-command, by my assurance that this catalogue was only a first estimate; that in order to avoid disappointment, I had set down what I myself thought the lowest figure, and that I had to leave out some works which examination might prove to be of great value, in which case our house would deal with him liberally. He had risen to his feet; but he sank again into his arm-chair on hearing this explanation, saying: 'Certainly, certainly; we cannot yet decide on the exact figure; and after all'—with a trembling voice and his loftiest air—'a few pounds one way or the other matter but little to me; but a man does not like to part with any of his property below what he himself believes to be its actual worth.'

This I judged a favourable moment for the commission I had received from my fair suppliant in the morning. I hastened to explain that a young lady, whom I judged to be his daughter—miserable me, driven to use such flattery!—'No,' he said; 'his grand-daughter.'—I bowed, and went on. The young lady had requested me not to include in my list a small family portrait of some value.

'I know the thing,' he said impatiently. 'She has been talking to me about it. Let it go. It is only a fancy of hers to keep it—a fancy, sir, which does not concern your business here. I want the gallery cleared, and I am only sorry so many of those vapid daubs of our ancestors have to remain there.'

His severe tone and cold looks were almost too much for me; but I was not outmastered yet. I replied in a firm but respectful manner, sorry for the artifice I was resorting to against his gray-haired ruined pride: 'You say sir, it does not matter to you whether the pictures bring a few pounds more or less. The price of this one is of no value to you; and the portrait itself is of so much value to the young lady for whom I speak, that she herself made it be my business and my concern to mention it.' This was a home-thrust.

'Of course I don't care about the paltry price,' he said. 'If she really wants the thing so much, strike it out of your list.' After that hurried speech, he bowed my dismissal, as he had done at the last interview, only remarking that he supposed I would carry the result of my work to London in the morning, and there would be no further delay. When I had gone to the foot of the staircase, in the dusk of the spacious flagged hall, I saw his grand-daughter coming hastily from a door-way, where no doubt she had waited anxiously for my step on the stairs.

'Have you asked grandfather?' she whispered.

'I have. He will do as you wish about the portrait. I have struck it off my list.'

'I am so glad!' she said, still in a low voice. 'I would not part with it for the world!' And she seemed surprised at her good fortune; while I knew but too well that the secret of it lay in my allusion to money affairs, a subject on which the poor man would have done anything rather than have a stranger's suspicion roused.

'You have been very kind,' she said—'very good to me.' And with some sudden impulse of gratitude she stretched out her hand, which I was but too proud to press for a moment in token of friendship.

'It was but a slight service,' I said, scarcely knowing what words I stammered out. 'I have to thank you for the pleasure of allowing me to do it for you.'

In another moment she was gone with a kindly 'good-night;'; and I tried in vain to persuade myself that it was possible for her to take my answer as anything but a piece of ordinary politeness. Yet I had meant it with all my heart. What else could I have said? I thought. What else could I have done? Of course my words had only the sound of a courteous answer, and as such she took them, thinking not of poor John Gildern, but of her rescued treasure.

In the morning I wished in vain for one sight of that fair simple-hearted girl, that had so unconsciously robbed me of my own heart's peace, and of my ordinary, unromantic, business-like frame of mind. More—I confess I loitered unnecessarily long over breakfast and departure; and I took many a side-glance as the shabby servant led me to the door, and then it was not by the shortest route that I made my way to the high-road. But there was no help for it; I left Elmsmere without seeing my little enchantress again.

III.

Four years passed to be added to John Gildern's thirty. I was fortunate enough to have a rich relative, and I gave up the service of Messrs Copal, and spent the best part of those four years travelling with him in Italy; and it must be admitted that I thought but seldom of Elmsmere after the first few months, though there were certain memories connected with the place, which might any day or hour have filled my time-tried heart as full of romance as was ever a boy of half my years. These memories I put out of my mind permanently, as useless and disturbing; but I had no other romance, though there were ample opportunities for such indulgence both at home and when we were on our travels. At the end of those four years we returned to London, and I took up my former employment, but at a different house, which I may call here the house of Messrs Easelby and Sons. One morning I was laughing over the pages of *Punch* in an idle hour—there were many idle hours at Messrs Easelby's—when a fellow-clerk said in his usual off-hand way of throwing work on me: 'You might open that parcel and attend to those letters which the late post has just brought in, Gildern?'

I made some remarks more forcible than courteous about the parcel and letters, adding: 'I shall attend to them this time; but it is none of my business.' It was in this mood that I opened the first letter. Had my fellow-clerk been a student of physiognomy he would have seen my annoyance suddenly change to a feeling very different. But my comrade had no such gift of insight; and even if he had, there were deeper feelings awakened by that letter which my face did not betray. It was addressed to Messrs Easelby, and the writing was light and unfinished in character, much like a school-girl's with *u* and *n* alike. It was in after-readings—days, months after that—I noted all this, and then it was in no spirit of criticism. At the time I only saw that it was from a young lady, asking if water-colour drawings of hers done at her former country home would be acceptable for sale, adding that any

price would be taken, as she was anxious to part with them; and the name signed was MARIAN —. Even here I cannot break the sacred secrecy of that second name; but it was the same as that of the owner of Elmsmere, and I no longer doubted who the writer was, even before I opened the thin flat parcel, and took out sketches of parts of the well-remembered garden, the avenue of elms, and the shallow reedy widening of the little river that bounded one part of the grounds, and gave the name to the house. The letter was dated from a shop that I happened to know, a stationer's in City Road. I knew also that this was merely an address for correspondence, and not the residence of the writer. Unfortunately, there would not be the smallest hope in offering the drawings to my employers. But it was impossible for one who knew the would-be artist, and guessed the history of their coming, to return them to her as a failure. At least it was impossible for me, with pictures of the past rising in my mind, and sympathy roused until it was pain. I inclosed a trifling sum, letting it appear to come from Messrs Easelby, and signing my name in my accustomed illegible manner; and that night I took the parcel of drawings to my own home.

Day after day I spent in plans for coming into actual communication with her. I built castles in the air then indeed, imagining how I would come to know her again; how her grandfather, who doubtless had by this time fallen lower in the world, would accept me as her suitor; and how life would run for the rest of our days like a fairy tale. At the same time, every week that went by in hesitation added to my anxieties, and at last I was positively suffering from suspense, all my old ardour roused and my sympathies quickened by the thought of this young girl, so unfit for the world's trials, obliged to do stern battle with them, and perhaps alone. My surmises were true. When about a month had passed, the clerk who attended to the correspondence came to me one day, laughing at a poor attempt at water-colour drawing. I took the cardboard out of his hand, touched to the quick, and gave some awkward explanation, ending with: 'I shall attend to it.' So I did attend to it, by sending to the girl's address a poor price, but the best I could afford, and taking home with me the worthless drawing. This happened twice again; and being now on the watch, I myself managed to receive the parcels and letters; and each time I did what any man on earth would have done had he been placed as John Gildern was—sent my own money with my useful illegible signature, and appropriated the poor child's work. Then fearing the repetition of my pardonable ruse might lead to some awkward discovery, I desired the sender of the water-colour drawings to leave them in future at an address which I gave in the City, and merely to mark them 'Messrs Easelby & Co.—to be called for.'

The result of this step proved that I was right in relying on her small knowledge of the business world. But what was my dismay to find when first I called at this city address, a package, which, on opening it at my own rooms, I found to contain—ah! how well remembered—the picture of Marian's mother. A voice came to me out of the past: 'I am so glad; I would not

part with it for the world.' But some overruling power had doubtless compelled it otherwise, and what a tale the parting told! I glanced at the accompanying letter. It stated with the most unbusiness-like simplicity that the writer greatly valued the picture, but she needed money at the moment. If Messrs Easelby would send part of its price, and leave her the chance of buying it back again at some future time, she would be most grateful. But if they never did business on those terms, she would sell the picture for whatever they thought it worth.

'Poor child! Poor Marian!' I exclaimed with heaven knows how sad and burning a heart; 'she is sorely tried somewhere in this great hard world of London—sorely tried, and perhaps without a friend.'

I paced up and down for a few moments with the open letter in my hand, thinking what could be done, and haunted by every soul-stirring memory that the sweet young face and trustful blue eyes had left me. I wrote a hurried note, and sent it on its way, delaying only to inclose a cheque for the picture, and to explain that it would be safely kept, and might at any time be repurchased by the sender. Then I wrote another letter, taking care that it would arrive a post later than the business communication, purporting to be from Messrs Easelby's clerk of the unknown signature. The second letter ran:

DEAR MISS N—, I have hitherto corresponded with you only in your business affairs in relation to Messrs Easelby; but strangely enough I once had the honour—far from forgotten—of meeting you at Elmsmere, when I was acting as agent for Messrs Copal & Co. I have not forgotten your kindness and confidence in allowing me then to do you a slight service in connection with a picture which has to-day passed through my hands. If you send a word in answer to this note to John Gildern at the above address, I shall take it as a sign that you will do me the great favour of permitting me to renew that chance acquaintance. If I receive no answer, I shall do my best to be resigned to the greatest disappointment of my life; and in either case your business relations with Messrs Easelby will continue exactly as if I had never ventured to send you this letter.

I took care to write my name with clearness in the body of the letter, but to sign it as usual at the close. After a day or two of the utmost anxiety, a few words came in answer. Poor Marian explained that her grandfather was ill, but that he would be glad to receive me, and that she hoped I would not be surprised at finding that they had suffered great losses and misfortunes, for I would visit a very different home from Elmsmere. At the head of this letter was an address in a street in Finsbury, a quiet dull corner, not far from the City Road. Thither I made my way the very first evening after receiving the letter; and I still recollect how dull that street looked in the twilight, all the houses alike, as if each row had been cast in a mould. As I looked up and down for the house, I wondered if the people who lived there had to make sure of the number every time they went home. The number I sought led me to a house where in the lower room there was but dim firelight, and bright light

only in the top windows. After a long delay I was admitted to the room distinguished in those houses as the 'front parlour.' The stout landlady, who seemed particularly untidy and in a hurry, poked up the fire before she left me, and I could see distinctly the worn furniture, the glass shades of wax-fruit and the old lace curtains that I still recollect in one vague dream when I think of that room. The fire was bright, flashing white on the walls, when there came in a fair girl, pale and altered, but blue-eyed Marian still. But how strange she looked—tearful, and without a smile! She stretched out her hand, with the sorrowful words on her lips: 'Poor grandpapa!' She could utter no more; but I understood the rest. The poor broken-down man was dead in that bright room up-stairs.

I would have gone away at once, feeling my presence an intrusion just then; but she asked me to stay, adding most simply, with her face hidden in thin white hands: 'You won't mind my crying a little; but don't go just awhile. It is kind of you to come, and I shall be able to talk to you soon. But I am so—so nervous and shaken.'

We did not meet as strangers. Sorrow and sympathy become friends at once, and there is no barrier of ceremony between them. Somehow she trusted me; why I cannot tell, except perhaps because she knew nothing of the world, and I had once shewn some little kindness to her about that picture at Elmsmere.

There is but little more to tell. I accompanied her a few days after to the old man's grave. It was a sad lonely funeral; we were the only mourners.

I let but little time pass until I won Marian and made her my own; for loneliness and grief were telling upon her, and I could afford to despise the tattlers who talked of my unbecoming haste. Ah! it was well to make haste, for little did I suspect then that my new-found treasure was already hastening away from me. She busied herself gaily in our new home; she laid plans of all she would do to make it 'a little paradise, John,' when she would be well and strong; but there was a dark look under my little wife's blue eyes, a hollowness of the cheek once so fair and smooth, a husky cough that drove me wild with increasing fears. There was for me a deepening beauty in her looks: but more and more I felt the hand of fate upon us, as I watched her face and delicate form from day to day, seeing but too plainly

Something faint and fragile in the whole,
As though 'twere but a lamp that held a soul.

At last the day came, dreaded—oh! how long! when raising her fair head from her pillow, my poor Marian whispered to the watcher in his constant place beside it: 'Dear heart, tell me, am I dying?'

Oh! how the words cut into my very soul—'Am I dying?' from the sweet flower of Elmsmere, and the same question from troubled blue eyes that had so charmed me long ago. 'Not dying, darling!' I could only say. 'Don't call it dying. It is only going home!'

Then she laid her head upon my arm, looking up at me with those pure childlike eyes. 'Don't grieve and fret, dear heart. Ah! I'm afraid you will. He will bring you home too, you know, into His bosom.'

When I sat before my lonely hearth, I took courage from those words to bide my time and work out my life bravely. My grief has not driven me into selfish seclusion, and I have found interest in covering the walls of my home with art treasures of my choice. Amongst these is the picture of Juliet, which, with a pardonable artifice of love, I pretended to buy back for my poor girl before her marriage. As to her own drawings, I kept them hidden, and she never knew my secret. The revelation would only have taken from her the pleasure of thinking that her work had supported her ruined grandfather. But when she was with me no more, I filled my own room with those worthless sketches—priceless to me; and it is among them now that I have gone back through those old years, and raised again the memories of Elmsmere and of Marian as I saw her first, before her frail life was broken on the hard world's wheel.

THE BALANCE OF NATURE.

NATURE—if not unduly interfered with by Man—preserves a tolerably even balance in all created things. At the same time the due proportions of animal life can only be maintained, as we all know, by that incessant warfare among living things which is everywhere observable. All Nature is alive, the world teems with life, and whatever is living must be fed and nourished, whether it be animal or vegetable. One tribe seems only created to afford food to another tribe, and the strong as a rule devour the weak. The world, indeed, could not give space or yield sustenance to all, if all were destined to live and multiply for indefinite periods.

Although every created thing, however small it may be, has its mission, and plays its part in the animal economy of sea or land, Man is not always able to distinguish its rôle, or to know sometimes which are his friends and which his foes. Indeed, various plans have from time to time been propounded for the stamping out of sundry insects and animals which it is fancied are injurious to agriculture; but happily without effect. When, for instance, the French gardeners and farmers killed off their small birds in a ruthless manner because of their partiality for fruit, they speedily found, from the enormous increase of all sorts of insects, that their remedy was worse than the disease; and they were very glad to let the little birds alone. They found themselves, in short, in the same plight as that of a certain proprietor of an extensive fresh-water fishery who determined at one time to capture and kill all the pike which were in his waters, and did so most successfully. But the result did not fulfil his expectations; his trout certainly increased in numbers after the massacre of the pike had been accomplished, but they ceased to fatten; in fact they so fell off in condition as to be quite worthless for the purposes of the table. The food in a trout-pond is limited, and the pike did his part in keeping down the numbers, and insured that those trout which escaped his voracity were fat and palatable.

A proposition to extirpate the rat was recently discussed by one of our learned Societies. The indictment brought against this much hated animal was a formidable one, and the poor rat had

not a single friend in the meeting to say a word in his behalf. The enormous fecundity and vast destructive power of the rat were forcibly argued, and the saving, particularly of grain, which would be effected were these animals utterly exterminated, was announced to be very large. But when such a proposition is brought forward, it is only fair that the part played by the rat in the economy of Nature should be considered, as it is perfectly certain that this animal is intrusted with the performance of various useful functions, the cessation of which might be dangerous. The lobster is eaten with relish, and appears at the most fashionable tables as one of the *entrées* of distinction. Lobster salad is considered to be delicious, and *potage à la homard* is the soup *par excellence* of the chief restaurants of Paris. Yet the lobster fulfils in the sea much the same functions as the rat in the common sewer; they both exist upon garbage and débris.

The rat has many enemies, and great efforts are made by farm-servants and professional rat-killers to keep down their numbers. Statistics of rat-killing are not difficult to obtain. The late Mr H. Mayhew, who was well versed in out-of-the-way information, reckoned that at least two thousand of these animals are required in London every week in dog-training or in killing-matches. In the larger cities and towns of the provinces, as many more will be destroyed in a similar way; whilst in manufactories, grain-stores, provision-shops, bakehouses, and private dwellings, countless numbers are annually caught by means of traps, cats, dogs, &c. In the country, the rat is preyed upon to a large extent by foxes, which kill an enormous number in the course of a year; and as rat-skins are now largely used in glove-making, the animal has a distinctive money value, which will aid materially in his repression. With all his sins, however, the rat is much maligned. Notwithstanding his depredations in the barn and stack-yard, his value as a sanitary agent is all-important, and his extermination might therefore lead to serious evils; especially when we take into consideration the undoubted fact that he is a perfect scavenger, and reaches and disposes of matter which might otherwise occasion disease and death.

Nothing aids the increase of vermin of all kinds so much as a plentiful supply of food. At one time rats were over-abundant in Paris; but during the siege, two causes combined to exterminate them—food of all kinds became so scarce that the people were glad to eat these vermin, those fed in granaries bringing the price of three francs each. As a matter of course, when food for the people became scarce, food for the rats became scarcer, and under the pressure of circumstances these animals were in the latter days of the siege esteemed a delicacy of the rarest description.

In the case of the dog-fish which attend the herring-shoals, we have an excellent example of how the enemies of a species increase, when the individuals of the species preyed upon become plentiful in a more than usual degree. If we hear the herring fishermen complain that the dog-fish are making a mess of their nets, we expect to see in the official returns a series of figures to denote a large increase in the herring catch. In some years the 'dogs' multiply so enormously as quite to

impede the men in their work; a boat's crew will sometimes capture as many as five hundred of these marauders in a morning; and during some seasons they are found in literal tens of thousands on the outskirts of the herring-shoals, snatching the fish from the nets in which they have been caught, and destroying sometimes more than they can consume. It is therefore obvious that if dog-fish exist in tens of thousands, the herrings upon which they prey will be congregated in countless millions.

It is difficult to convey an adequate idea of the number of individual fish which may compose a shoal of herrings, and it has been averred that they would speedily impede navigation were it not for the vast number of agencies that are at work to prevent an undue increase of their number. As the result of recent inquiry, we have been informed that the quantities which man takes from the water for food-uses do not represent a tenth of what are captured by the sea-birds, or devoured by marine enemies. As the herring is the only fish of which statistics of the capture are collected and tabulated, we are in possession of figures which afford us a rough idea of the numbers annually withdrawn from the sea for food-purposes. In a recent year, sufficient herrings were taken to fill a million barrels; and as each barrel contains on an average seven hundred fish, we have thus a number equal to seven hundred millions. This quantity it must be observed represents *cured* fish only, and only those which are caught in Scotland under the superintendence of the Fishery Board. It is pretty certain that as many herrings are captured and offered for sale as fresh fish and 'reds' as are cured for the markets in Scotland and offered for sale as salt herrings; which gives us the prodigious total of fourteen hundred millions withdrawn annually from the sea; and even this number, vast as it is, does not include what are used in the form of white-bait, or those which are sold as sprats.

After draining the sea to such an extent, it might almost be supposed that there would be scarcely so many herrings left as would suffice for a breeding stock; but the demands of man are a mere fraction of what are taken out of the shoals. All that are captured, as well as all that are wasted during the capture, and destroyed in the process of curing, sink into insignificance when compared with the vastness of the quantities which are devoured by other enemies of the fish. Cod and ling are known to prey extensively on the herring; and a calculation, based on the number of cod and ling annually caught under the auspices of the Scottish Board of Fisheries (three million five hundred thousand were taken in 1876), assumes that there is a capital stock of these fish in the Scottish firths and seas of seventy million individuals; and that each individual consumes four hundred and twenty herrings per annum, which at the rate of two herrings every day for seven months in the year, shews a consumption of twenty-nine thousand four hundred million individual herrings. Nor does the account stop at this point. The Commissioners who recently collected information on Scottish herring-fisheries, assume that in Scotland alone, the gannet (a sea-bird) will annually draw on the shoals to the extent of one thousand one hundred and ten

million herrings! In addition to dog-fish, cod, gannets, and other sea-birds, the herring has many other enemies; porpoises, seals, coal-fish, and other predaceous fishes are constantly lying in wait to fall upon and devour them. A female herring, we know, yields over thirty thousand eggs; but at the shoaling-time myriads of those eggs are devoured by a variety of enemies; besides which, hundreds of thousands of the eggs are never touched by the fructifying milt of the male fish, and so perish in the waters.

Certain species of flies multiply in an alarming ratio and with great rapidity. We have the authority of Linnæus for stating that three flies with the generations which spring from them could devour a dead horse as soon as a lion could. Almost every flower and vegetable of the garden is the dwelling-place of a countless number of insects, which live upon them and multiply and replenish. Many recipes are in use among gardeners for the destruction of these pests; but prevention is better than cure, and when methods can be devised to prevent their appearance on the scene, it is better than killing by mineral powders and other plans. Here is a chance for the toad shewing his usefulness, as any one may prove who keeps a garden. The toad is a voracious feeder on all kinds of garden insects, and this knowledge induces London market-gardeners to purchase them in quantities.

Some farmers and landlords regard with high disfavour the depredations committed by rooks; but it cannot be sufficiently urged that these birds, if they do help themselves to a little of the newly sown grain, make ample amends by the good they achieve as grub-hunters and worm-eaters. Thus it may be taken as an exceedingly moderate estimate that the common rook will eat one pound-weight of food in each week, the greater proportion of such food being insects, grubs, and worms. One hundred of these birds will therefore consume in a single season as much as four thousand seven hundred and eighty pounds of matter that would prove exceedingly injurious to the farmer. In France, during the period of bird-murder, fourteen thousand beetle-larvæ were gathered by a small body of children in a few days; and at another time and during one season, twenty-eight million of these pests were collected, and after being boiled, were spread upon the ground as manure.

Within the last few years farmers have had legitimate cause of complaint with regard to the extraordinary increase of those genuine pests the wood-pigeons. In reflecting, however, upon the causes which have induced this increase, consideration must be given to the changes which have taken place in the rotation of crops: likewise, as we shall presently notice, to the merciless slaughter of our birds of prey. In destructiveness, the wood-pigeon may be said to excel every other pest with which the farmer has to contend. The ravages committed by this bird on grain and on the young shoots of turnips, seem to be in no way compensated for—as in the rook—by the devouring of grubs, wire-worms, and noxious insects. Mr Scott Skirving, an authority on such matters, estimates that as many as twenty thousand individual pigeons have been seen in one flock! They are fond of red clover, of which a plentiful supply is now grown in Scotland, and their food being

plentiful, the birds thrive and multiply. It would be for the general benefit if adequate means could be hit upon for keeping wood-pigeons within reasonable bounds.

In treating of the causes which affect the due preservation of Nature's balance, we would take this opportunity of protesting, as we have frequently protested before, against the indiscriminate slaughter of hawks and owls. Gamekeepers, with certain notable exceptions, seem to have *carte blanche* to shoot and otherwise destroy every animal that does not come within the category of game. And what is equally bad, their masters but too frequently approve of the slaughter.

Nothing can be more short-sighted than this indiscriminate killing down of animals which, though apparently inimical to the interests of the game-preserve, are in reality fulfilling a marvellously useful end, inasmuch as they serve to preserve the balance of Nature. Thus the peregrine falcon, though occasionally guilty of carrying off a grouse or partridge, is the means of killing thousands of wood-pigeons. The pretty little kestrel, which falls, with the rest of its tribe, a victim to the keeper's gun, includes in its dietary animals which are in ill repute with the farmer—namely, mice, frogs, and snails. While the owl, so far from damaging the interests of the farmer or the squire, is one of their best friends, and keeps the fields and barn-yards clear of mice, which, but for these silent night-flitters, might become a terrible nuisance.

Again we urge that the wholesale system of slaughtering animals simply because they are supposed to be game-destroyers, is one that demands inquiry and rectification.

LENTILS—CHEAP COOKERY.

VARIOUS kinds of cheap and nourishing articles of food, the properties of which were previously but imperfectly known, have been lately introduced with success into many homes in the community. Amongst these articles of food brought prominently into public notice and use has been the lentil, which now bids fair to continue to be a staple article of consumption and commerce.

As far back as the year 1851, a notice appeared in this *Journal* on the 'Lentil in Scotland.' At that time M. Guillerez, a French gentleman resident in Edinburgh, made an attempt to bring about the adoption of lentils as a British field-crop, and succeeded in sowing and bringing them to great perfection in ground near Queensferry. This experiment was entirely successful; and in the same paper the usefulness of the lentil in the homes of the poor was plainly stated, from its cheapness and nutritious qualities; the fact being that on the continent six men could dine well on a dish of lentils, costing *twopence*. The public mind has, however, been slow to accept this novelty in food, until the sufferings undergone by many during the winter of 1878-9 again forced the matter into prominence. Mr W. G. Ward, writing in the *Times* on January 23d of this year, noticed the fact that the last cargo of lentils imported into Liverpool found not a buyer as human food, so they were ground, and sold to feed pigs. The only other cargo in England at the time was at Gloucester, where it had remained

unsold for about two years, and was only then beginning to move off, as public attention was being awakened to its value as an article of food. Now we find the lentil sold and displayed by most respectable grocers in both town and country at threepence per pound, and in some places even at less.

A little well-timed volume on *Food for the People; or Lentils and other Vegetable Cookery*, by Eleanor F. Orlebar, supplies much useful information on this subject. The lentil is a kind of tare or vetch, with weak, angular, creeping, and clinging stems from one to two feet long, separated from near the bottom into several branches. Delicate stalks grow from the axils of the leaves, bearing whitish or purple flowers; and the pods when matured do not bear more than two sound seeds, flat on both sides. Where introduced as a field-crop in England, they have generally been used as fodder and food for cattle and pigs. To grow well, they require a light, dry, sandy yet strong soil, and may be sown about the middle of March. When ripe, the pods are thrashed, winnowed, and cleared like corn. Pulse of lentils is much eaten during Lent on the continent, and some are of opinion that the name of this season of fasting is derived from this favourite food. Revalenta Arabica, so highly recommended for invalids, is simply the well-ground flour of lentils. Dr Playfair on examination found that one hundred parts of lentils contained thirty-three parts of albumen or gluten, and forty-eight parts of starch, &c. They are well-known articles of daily consumption in Syria, Arabia, Egypt, North Africa, and the south of Europe generally.

To Mr W. G. Ward, of Ross, Herefordshire, belongs the credit of causing the demand for lentils, by several letters written to the *Times* on the subject. Mr Ward is one of the oldest vice-presidents of the Vegetarian Society; but though we do not indorse all his views, there is much that is worthy of attention. Speaking of cheap dishes for the poor, he recommends a tin of tomatoes, which may be bought at from sevenpence to tenpence a tin, which will form the relish for four dinners for three persons, to be used in the following fashion: Put a fourth of the contents of the tin into a frying-pan, with a liberal quantity of salt and some butter. Fry and boil; toast a slice of bread for each person; let it soak in the gravy; and then eat bread, tomatoes, and potatoes, all covered with rich gravy.

By using celery well cooked, Mr Ward declares it will be impossible to suffer from rheumatism, the latter ailment springing less from cold and damp than from acid blood. Used in the following form, he declares that celery is a preventative of both rheumatism and gout: Cut the celery into inch-dice; boil in water until soft. The water may be drunk by the invalid. Then take new milk; slightly thicken with flour; and flavour with nutmeg; warm with the celery in the saucepan; serve up with diamonds of toasted bread round dish, and eat with potatoes.

The simplest method of preparing lentil soup is to wash, soak over-night in water, and boil them for three or four hours, adding onions, carrots, celery, or other seasoning, according to taste. Miss Orlebar thus quotes from the lips of a German corn-dealer: Half a pound of seeds will make a

quart or three pints of excellent soup. Do not strain off the liquor. The seeds will be soft like green peas when they are done; and all you will actually want for simple lentil soup is one of these little packets, two quarts of water or more, because it will keep boiling away; and remember to put them in the saucepan with the liquor in which they have been soaked.

We give what Miss Orlebar says was her 'best success' in cheap soup-making: Half a pound of uncrushed lentils, one carrot chopped, three onions, one leek, two pounds of parsnips, an ounce of chopped parsley, pepper, salt, a dessert-spoonful of brown sugar, and three large crusts of bread. We washed and picked the lentils, soaked them all night, boiled them with some soda in a large saucepan from ten to one o'clock, pressed them through a colander, heated up again, served, and thought our soup delicious. It cost *very* little, and was enough to last for two or three days.

Those who wish to be initiated further into the mysteries of lentils prepared with meat, and lentil puddings, &c. may consult Miss Orlebar's book. We will conclude by noticing one or two of Mr Ward's other statements regarding lentils and haricot beans. According to Boussingault's scale, fifty-six parts of white haricot beans, or fifty-seven parts of lentils, or sixty-seven parts of peas, are equivalent to one hundred parts of wheat-flour. Haricot beans when properly prepared are extremely nourishing. A common method is to boil them soft, and eat them with parsley sauce and potatoes. Another way is to prepare them after the manner of the Mexican national dish frijoles: boil until soft; drain; turn into the frying-pan with sage and onions, and fry with olive-oil; and then eat with potatoes. The sage and onions may be left out if desired, and flavour instead with Cayenne or curry powder; or make tomato sauce for the beans. Once cooked, these beans may be eaten perfectly well when cold. Such are some of the recommendations regarding cheap vegetable cookery, which, if introduced, may be a boon to thousands of homes.

SUN-LIGHT ON THE SEA.

THE August glamour falls upon the sea,
What time the East is flushed with roscate dawn,
And the brown sails on the horizon line
Shew out, a stately troop of messengers,
To all the climes of Earth.

The clover-fields
Are pink with fragrant blossoms, and the corn,
Its red-gold earlets rustles in the breeze,
That sea-born, on the white cliffs gently stirs
With whispering music the rich harvest-fields,
And softly dies away.

Up-heaves the breast
Of slumbering Ocean, glimmering in the sun
With green and purple sheen: and on the belt
Of yellow sand that bounds the wide sea-shore,
Beat the foam-crestlets of the breaking waves,
With murmurous ripple: on the shingle-beds,
Drawn up in grim array, the fisher-boats
Their black-tarred hulls shew in the flickering light—
The golden sun-light shimmering on the sea!

A SHIPWRECK AVERTED BY THE USE OF OIL.

ON several occasions we have urged on public attention the wonderful efficacy of oil in allaying rough tempestuous waves at sea, in cases of danger to mariners. 'Throwing oil on the troubled waters' is an old figurative sentiment, to which few pay any regard. The sentiment, however, has a foundation in fact, of which every one can satisfy himself, by practical experiment. So true is the fact, that the real thing to be wondered at is the frequency of shipwrecks which might probably have been averted by the simple sacrifice of a small cask of oil. Certainly those mariners who neglect to try the effect of this inexpensive precaution have not a little to answer for. How the oil should reduce the violence of the sea, is a scientific question. All that need here be said is, that the film of oil spreading along the surface of the surging waves tends to produce a calming effect, of which the navigator, driven to his last shifts, would be wrong not to take advantage.

Some instances of the value of oil in saving from shipwreck were given by us in an article, 'The Use of Oil at Sea,' 10th August 1878. In another article, 'Throwing Oil on the Waters,' on the 21st December 1878, we detailed the experiences of Shetland fishermen in saving their boats from being wrecked in raging tideways, by a very simple expedient. They crush in their hands the livers of any ling or cod they may have caught, and keep throwing them astern and around them. The effect is said to be magical. The waves are not lessened in size; but the oil keeps them from breaking, and thus extreme danger is averted. As what we stated was on trustworthy evidence, and may be readily verified, there is positively no excuse for neglecting precautions of this kind. The navigator who goes to sea unprovided with oil to be used on an emergency, may almost be said to invite destruction.

Not only should all sea-going ships be provided with oil, as a counteractive of danger to life and property, but all fishing-craft and pleasure-yachts.

We would particularly enforce this precaution on those who are intrusted with the use of Life-boats. For boats of any kind, one or two bladders of oil would suffice, and the cheapest whale-oil would answer the required purpose. When used in case of a storm, the bladders might be inclosed in a coarse canvas bag, and pricked all over with the point of a knife, to let the oil ooze out on the water. It will be proper to secure the bags to the boats by means of cords before being thrown overboard in the direction which appears most desirable. It might be suggested that in order to acquire proficiency in the management of these oil-bags, experiments should be made at suitable opportunities; the expense and trouble of such experiments being very inconsiderable in comparison with the advantages that may be derived.

In consequence of our repeated urgings, we should have refrained from so soon returning to the subject, but for receiving a letter from Mr Alexander Sprunt, British vice-consul at Wilmington, North Carolina, United States, dated 28th June 1879. The following is the letter, which will not be perused without interest by our readers:

'DEAR SIR—I consider that you are entitled to the thanks of not only shipmasters and shipowners, but of all who go down to the sea in ships and do business in the great waters, for publishing in the widely circulated *Chambers's Journal* the fact that during dangerously tempestuous weather at sea, a comparatively small quantity of oil thrown on the breaking waves greatly relieves the storm-vexed ship. I yesterday took down the experience of the master of a brigantine just arrived here from Bristol, on this point, as inclosed herewith. I doubt not you will receive many such acknowledgments of the excellent results attending the use of oil at sea; and it might be well still to keep before the reading public, both in Great Britain and this country, the great importance of this simple but valuable discovery.' The writer adds a number of personal compliments, and incloses copy of the following official deposition:

'British brigantine *Gem* of Sackville, New Brunswick, Richardson master. On the 1st April last, bound from Wilmington, North Carolina, for Bristol, took a heavy gale of wind about a degree to the eastward of Bermuda, from the south, veering rapidly to the north-west, whence it blew a hurricane for thirty-six hours, with a cross-breaking sea, ship labouring heavily—"started" the after-house and boats, stove lazarette hatch, and took try-sail from the mast. All hands aft in the cabin in case the sea should break over and carry away fore-house. 8 P.M., sea getting worse, the master thought of resorting to the oil experiment, which he had read of in *Chambers's Journal*. Had a canvas bag prepared, holding about three quarts of kerosene oil, with a rope of six fathoms attached, and kept trailing to windward; the oil leaking through the canvas greatly broke topping sea, and made matters much more favourable for the ship. This was kept up through the night; and at 3 A.M. on the 2d April the weather began to moderate. The mate, who had himself lashed to the rigging during the whole of his watch, believed with the captain that the resort to the oil saved the ship, as such fearful weather had never during the captain's experience of fourteen years been witnessed by him. A drop of the oil will smooth about four feet circumference of sea. Captain Richardson suggests that a canvas bag to hold about six gallons is the best size, pierced with small holes with a penknife, the holes to be enlarged as the canvas becomes wet and its texture closer.'

Here, then, is official testimony to the value of oil in allaying certain dangers on the occasion of tempests at sea. Surely, if there be truth in that and similar testimony, the duty of enforcing it should not be left to the editor of *Chambers's Journal*. We allow there is a vast gratification in knowing that we have been instrumental in doing the good which is above candidly admitted. But the matter goes beyond our efforts. It eminently deserves the attention of Lloyd's, and of all others who are specially concerned in shipping.

W. C.

YOUNG LORD PENRITH.

CHAPTER XLIV.—THE TWO LETTERS.

'Two letters for you, Mr Ashton,' said Edmunds the head-porter, as Hugh, who now found more time on his hands than he could easily dispose of, returned, after one of the solitary rambles that were now habitual to him, to the station. One of these—which was sealed with red wax, and bore the impression of a coat of arms such as the Heralds' College grants for money in this degenerate age, when the heraldic instinct seems dead, and the simple beauty of antique blazons unattainable—was from Mr Dicker. Hugh's patron, in kindly terms enough, informed his young friend of his intention, on a tour of inspection, in company with two other Directors, of visiting Hollow Oak Station on the ensuing day. Mr Dicker, as Deputy Chairman, named two o'clock as the probable time for the

arrival of the Directors' special train, hinted at possible promotion for Hugh as the result of his late courageous action, and expressed his intention of formally verifying the accounts and receiving the amount of cash accumulated at the station.

Now it so happened that the sum-total of the cash under Hugh's charge was, for so very minor a station, unusually large. There are, of course, regular rules as to the paying over of moneys in the hands of station-masters into those of a Company's Manager, or Deputy Manager; but these rules admit of exceptions, and one such had been made in the case of Hollow Oak. The late station-master, Mr Weeks, had left a hoard of his employers' gold and silver behind him; while an unusual amount of ready-money had been lately received, on account of cattle, sheep, poultry, and other agricultural produce, alive or dead, which had been transmitted to London at that hungry Christmas-time. Hugh had a hundred and ninety-three pounds, odd shillings, in the cash-box, which was kept as usual in the station-master's house, ready to be handed over to the proper authorities.

As for the accounts, there could be no difficulty about them. They were short, simple, and had been kept so steadily posted up that a very brief survey would suffice to audit them. Hugh thought much more of the friendly terms in which the capitalist addressed him, and of his satisfaction in seeing that kind face again, than he did of the responsibility which his position entailed upon him. The other letter, however, now claimed his attention. It was very different in appearance from Mr Dicker's, being an ill-written and untidy missive enough, the contents of which, however, when he opened it, were such as to send the blood rapidly coursing through his veins. These were the words of the letter:

SIR—If you will take the trouble to be at Bullbury to-morrow (market-day), and will meet, at the *Chequers* in King Street, a person who Wishes you Well, and will be in waiting there at one o'clock P.M., you may learn some information of value to you in the search in which you are engaged. Mr Ashton is advised, for the sake of what he holds dear, not to fail at time and place, where I shall count upon meeting you.

Such was the letter, which was in the strictest sense anonymous, inasmuch that it bore no pseudo-signature, such as 'Lovers of Justice,' and the like, are wont to append to the epistolary arrows they launch in the dark. And Hugh was not the less inclined to place some credence in the good faith of his unknown correspondent, on account of the grammatical slips, or the irregular transition from the third person to the present, which the letter itself contained. But in any case he should have blamed himself had he flung away a chance, no matter how slender or how desperate, of elucidating the dark mystery that he had vainly tried to pierce. It was quite true that since Hugh's appointment to Hollow Oak Station he had made many inquiries, guardedly, as he thought, but not so guardedly as to avoid the appetite for gossip, which is the bane of a country neighbourhood. But he had gained no information worth the having. Gipsy Nan alone seemed to possess a clue to the secret that he would have

given his very life to solve; and although he had tried, repeatedly, to meet with the wayward wanderer again, he had failed to obtain a second interview. Her people, even, seemed to have shifted their camp to another part of the Forest, and could not be met with. Hugh felt that he had no choice but to accept the anonymous invitation to the *Chequers* at Bullbury.

Hugh never hesitated as to keeping the rendezvous which had been given to him by his unknown correspondent. It so happened that no duties of an urgent character compelled him to be at Hollow Oak at or near the hour named in the letter. Had his nameless friend been cognisant of the ordinary routine of the little official colony, he could not have timed more conveniently the hour appointed for the responsible chief of the station to be seven miles off, at Bullbury. At one o'clock the porters went to their well-earned dinners, in the full conviction that there was nothing to do. Later on there would be lumbering Parliamentaries that stopped at Hollow Oak, and swift trains that went by like the wind, but which, unlike the wind, required clear rails and elbow-room. But for the moment the station-master and his subordinates had really nothing to do.

Hugh borrowed a farmer's horse—his Australian experience of bush-leapers and buck-jumpers had been noised abroad, and he had been begged to break in more than one skittish colt, since he came to Hollow Oak—and rode over to Bullbury. The chief hotel there, like the only public-house in Hollow Oak, bore the name of the *Beville Arms*. But Hugh did not choose to patronise the chief hotel; nor did the *Angel*, the *Rose and Crown*, or the *Harp*, dear to Irish labourers employed on the canal works, find favour in his eyes. Inquiring his way, he rode up to where the ancient sign of the *Chequers* swung aloft over cobble-stoned King Street, and there dismounted.

There was not much business done, even on market-day, to all appearance, at the *Chequers Inn*, Bullbury. Inns, like other institutions, have their fashion, and run to seed. The *Chequers* of Bullbury, third-rate at best, was now, to judge by the eye, obsolete. Two or three farmers or bailiffs had what they called their 'traps' in its grass-grown yard. A few horses were rattling their halters in its damp stable. The waiter who ran about carrying half-cooked meat and half-boiled vegetables to grumbling chance customers in the mouldy old coffee-room, was out at elbows, and had white seams to his coat, and a general air of irritable dejection. The very mastiff in his kennel seemed infected by the insolvent melancholy of the place, and whined instead of barking. It was plain that the *Chequers* was in a bad way of business.

But Hugh saw no sign of anybody on the look-out for him, or for any stranger. Over and over again did he pace up and down before the wide gateway, down which the winter wind whistled shrilly; but not a glimpse could be caught of any person who seemed likely to communicate tidings of importance. The few people in the mouldy coffee-room appeared to be gloomy and preoccupied, men who devoured a bad dinner in hurried fashion, then called for the bill, and snarled at it, and were stingy to the ineffably shabby waiter, and went out into the town, declaring in no measured language that the *Chequers* was a rat-

hole that should have no more of their patronage.

But as for any one intent on him or his concerns, Hugh Ashton felt as though he might as well have been in the Sahara itself, amidst yellow gravel, and thorn bushes, and driving sand, such as constitute every wilderness from the Pillars of Hercules to many-hued Nile. There seemed to be not a soul, in or near the inn, whether man or woman, whose mind was busy on any other subject than the welfare of the thinker. When Hugh asked the hostler if any strange gentleman were waiting about, the rough fellow, in his catskin cap and fustian jacket, replied by asking if Hugh 'knowed of a place where a poor man as knowed horses, and did 'em justice allays, could make a living.'

And the fluffy-haired waiter, in a white-seamed coat and pumps down at heel, confided to Hugh his desire to serve some member of the British aristocracy, in town or country, 'where I might be treated a little less of a negro slave, and have a trifle wholesomer victuals, when dinner-time does come!' concluded the waiter, with suppressed vehemence, and a stealthy shaking of a feeble fist towards the window of the room wherein his bankrupt master, with his lean wife and unruly children, were dining noisily.

At last Hugh went back, baffled and perplexed. Had Ghost Nan been the writer of the letter, and if so, why had she failed in keeping the appointment? Hugh could not tell; but at anyrate, he had lost nothing save his time. On riding back to Hollow Oak, he found the station peaceful, and the regular routine of the day going on as steadily as ever.

CHAPTER XLV.—SALEM JACKSON'S STRATAGEM.

As a gaunt and hungry winter-wolf prowls about a sheepfold, half-maddened by the scent of live mutton that comes steamingly from the woolly flock, close-packed within, and yet keenly anxious to keep clear behind him the track by which his tireless gallop over snow and sward, through bush and brake, may outstrip hound and horseman, until he sees the Pyrenees, with peak unsealed by human foot, and cavern into which none but the 'gray beast' dares to creep, towering aloft like the ramparts of his city of refuge; even so did Salem Jackson, once a mariner on board the steamer *Western Maid*, range around the station of Hollow Oak.

Hugh, who knew him, was away. Salem Jackson, prompted by the Black Miller, had taken care that such should be the case. His anonymous letter, backed by Swart's local knowledge, had drawn away, on a false scent, the object of his hate and fear. The former mutineer had never forgiven the blow by which Hugh Ashton, on the occasion of the shipwreck, had caused him to measure his length on the steamer's deck; but then he had never forgotten it, and the remembrance of his former captain's superior prowess cowed him. Salem Jackson was of quite another order of scoundrelism from that to which his grim employer, Ralph Swart, belonged. Had any man struck the Black Miller a blow, there would have been a grapple indeed, from which one or other would hardly have emerged alive and unmaimed. But Salem Jackson was of another

mould. He feared hard knocks. He feared the law. He had used the knife, and had fired the revolver, not always with lethal consequences, in southern cities to the west of the Atlantic. But that was because others did so, and because, in tavern brawls at Memphis or New Orleans, it was safer to fight than to allow other rowdies to have free play for pistol or for bowie. In England, however, and with Hugh Ashton, though unarmed, for an antagonist, Salem Jackson preferred not to resort to the rude arbitrament of blows.

The sailor had his bowie-knife in the weasel-skin belt that he wore beneath his blue waistcoat. But he had no pistol. His three revolvers, relics of a stormy past on the other side of the ocean, he had purposely left at Treport. He would not trust himself to carry firearms, for fear, before his treacherous work was done, the door should burst open, and he should find himself confronted by his former Captain, and only able to free himself by doing what would bring his felon neck under the immediate attention of the Newgate authorities. He meant to succeed, this time, by fraud, but not by force, and therefore perhaps deserved to be likened rather to the fox than to the fox's lupine cousin, that turns so savagely on dog and man as they follow, straggling, in the long pursuit over hill and dale. Both Sir Lucius and the Black Miller had judged rightly in selecting this man, inspired as he was by mingled hate and greed, as a worthy instrument for vile designs: Salem Jackson was strong and lithe, and had a practised cunning which had eluded deserved punishment before that day.

The habits of railway servants at small stations are so much alike, allowance being made for the coming and going of trains, that their proceedings may be predicated with almost as much certainty as those of bees or ants. At Hollow Oak there was nothing to prevent porters or policeman from locking up the station and going off to dinner at one o'clock, the hour most congenial to themselves, and most convenient to their families. Nobody, on these occasions, was left in the station except Hugh Ashton, if he chanced to be at home, and a boy, a sort of apprentice to the guild of portership, who was called familiarly 'Brooms,' who drew about four-and-sixpence of weekly salary from the Company's exchequer, and who rubbed door-handles, and cleaned lamps, and wore corduroys, and was by no means the least efficient of the permanent staff there on duty. It had been arranged that little 'Brooms,' who was the son of a widow—and, it may be said, a widow of the Company's making, since his father, a plate-layer, had been killed on the line through some inattention to the switching of points—should always get such dinner as he was to have when the men came back from theirs, in order that the station might never remain absolutely ungarri-soned. And this, Salem Jackson, peering down from the edge of the fir plantation that crested the bank on the down side of the line, was not slow to perceive. He saw the porters troop off, like schoolboys dismissed from school, and saw the green-coated policeman follow them yawningly. Hugh Ashton, he knew, was, thanks to the lying letter he had himself, at the Black Miller's suggestion, indited, away at Bullbury. But then there was the boy.

Little Brooms, when left alone, moved for some

minutes to and fro, walking the platform with an air of authority, much as some junior lieutenant in the navy, who was a midshipman but yesterday, walks the deck as officer of the watch. He tried doors, glanced into the telegraph-room, as if to see whether anything had occurred to the instruments, and looked into the empty waiting-room and booking-office. Then, he began gravely to peruse the scraps of literature gratuitously provided in the shape of large-type advertisements, and seemed absorbed in contemplation of the merits of iron bedsteads, cattle-fool, mustard, and perambulators. Salem Jackson, watching this young student from his lurking-place, waxed impatient. The minutes were flying. Was this urchin such a marvel of steadiness that he would stand sentinel until the men returned from dinner? And if so, would it not be necessary to secure his silence by—

Ha! a change had come over young Brooms, and he had forgotten, for the moment, his position of responsibility as a railway servant, to remember that he was a boy, and strolled off to the locked carriage-gate of the station, there to indulge in a contest of repartee with other little lads of his own age, who came close to the wooden bars to banter him with rustic wit on the subject of the official cap and buttons, which they nevertheless envied, and to ask if he were hungry. Now was the time! So good an opportunity might never recur. With a sailor's activity, Salem Jackson cleared the fence, scrambled down the bank, and darted across the line. The boy, still beside the gate, had not turned his head. There were some crates, filled with live poultry, waiting for conveyance to London, stacked in a corner. Behind these Salem Jackson ensconced himself, while he took a closer survey of the place. What he desired to find must be looked for, he felt convinced, either in the ticket-office or in the station-master's house. The latter was the more likely of the two. But as a prudent general leaves nothing to chance, he determined to explore the ticket-office first.

Peeping round the corner of the pile of crates, Salem Jackson looked cautiously at the boy. The boy's face was yet averted, but he seemed as though he were in the act of turning his head. Quick as thought, the ambushed lurker crept from behind the crates, and gained the waiting-room, through which he passed into the booking-office. Once in the citadel, as it were, of the little pacific fortress that he sought to surprise, the Cornishman who had seen the world made haste to profit by the occasion. The tiny ticket-office was locked up. This was a matter of course. But the intruder's quick eye soon perceived that the stout timber partition, painted and varnished, which shut it in, separating it from the booking-office—which also served as a waiting-room for passengers of the second and third class—did not reach the ceiling, but left, probably for ventilating purposes, a space through which a man could easily squeeze himself. To scale the wooden screen, difficult perhaps to a rustic, was to a sailor a feat that presented no difficulty, and soon Salem Jackson found himself on the inner side of the partition.

The ticket-office did not prove to contain what the Black Miller's emissary was hunting for. In a half-shut drawer were two sovereigns and some

thirty shillings in silver. There were the tickets, and the stamping instruments, and some accounts and printed forms, and a watch belonging to the clerk or head porter, and an overcoat hanging on a peg, and a few parcels in brown paper, ready for conveyance. With none of these things did Salem Jackson meddle. He was in the act of reclimbing the partition, when he heard footsteps and the sound of a young voice, and in an instant he removed his brown sinewy hands from the top of the wooden screen, and stood, motionless as a statue, on the inner ledge close to the aperture where tickets are given out and change counted, stooping his head low, lest it should be visible above the partition.

Would that boy never go? Perhaps the fire in the booking-office was an attraction, on that chilly day, compared with which even such social intercourse as was possible through the bars of a gate had lost its charms. But at anyrate young Brooms lingered long in front of the blazing coals, shuffling his feet as he hummed a nigger ditty picked up from some roving company of begrimed serenaders, and all this time the strong man, scarcely venturing even to glance up at the clock overhead to note the provoking flight of time, watched and waited. All unconscious was the lad of the close proximity of Salem Jackson, with his knife concealed beneath his clothes, and breathing softly in the dread of being overheard. Would the brat never go? The villain grew desperate as he saw his chance of success and safety waning. Should he spring out now, like a tiger from the long grass of the jungle, he could readily—

Ah! Brooms, with the versatility of his age, was sauntering out at last, unwitting of the bony fingers that were preparing to clutch at his throat.

When the sound of the boy's iron-bound heels had died away in the distance, the seaman leaped noiselessly over the wooden screen, traversed the waiting-room, and after a brief sojourn under the lee of the pile of crates, made his way to the door of the station-master's house. The door was locked. But Salem Jackson was prepared to find it locked. Drawing from an outer pocket of his rough pea-coat a bunch of skeleton keys, such as locksmiths and burglars use, he selected one and then another. At the second attempt he succeeded, went in, and shut the door. There was nothing in the parlour, he found, that would serve his purpose. In Hugh's bedroom, when he reached it, he found a cupboard which was locked, but which, with slight trouble, he contrived to open. In it was a large-sized box of japanned metal, bearing the initials of the Railway Company, and secured by a patent padlock. The sailor shook the box, and heard the rattle of the money inside.

'Let us see, now,' muttered the fellow, as he produced another and a smaller bunch of wardless master-keys, 'whether the old Philadelphias won't tackle this toy from Brummagem.—I thought as much!' he added complacently, as the lock yielded to his efforts, and he was enabled to lift the lid of the cash-box. The sailor's eyes brightened as he saw the notes and gold within, and that the sum was larger than he had expected it to be. There were papers too, but of these he selected but one, which he crammed hastily into his pocket, along with the bank-notes, and the

gold. Then he reclosed and relocked the cash-box, replaced it in the exact situation where he had found it, and locked the cupboard. Hugh's window had been left open. It was high above the ground, but an agile man could drop from it into the garden below, uninjured. Salem Jackson crept down-stairs, locked the door, remounted the stairs, and, emerging from the window, grasped the sill firmly, and dropped, as softly as a cat would have done, on the strip of turf below. Then he leaped the fence, climbed the paling, burst through a plantation of young trees, and, with an ugly grin of triumph, descended the bank, ran across the line, and plunged into the fir-wood, at the opposite side of which wound the Bullbury Road.

'Lifted that one's hair, I guess,' snarled out the sailor, as he trudged off townwards. 'I'd give a hundred dollars, I would, to see his face, presently.'

But Salem Jackson had not seen another face, watching him from amidst the dark trunks of the fir plantation as he cleared the garden fence, nor did he hear the footsteps that seemed to echo his own as he neared the town of Bullbury.

WEST OF SCOTLAND FOLK-LORE.

WITHIN the last two or three years, considerable progress has been made in the collection of the folk-tales and country sayings which remain to us. Not only has a Society, under able guidance, specially devoted itself to the collection and preservation of those relics, but numerous works upon the subject of folk-lore have seen the light. It is a truism that railways and the schoolmaster are fast changing all the conditions of life. Every year the network becomes more complex, every summer the tourist penetrates into remoter villages. The coming and going of many strangers, the news from east and west, have their imperceptible influence in inspiring new thoughts. Parents find that their children have learned at the Board school to despise all the little home superstitions; and they themselves therefore grow yearly more and more afraid of inquisitive gentlemen who want to know if there are any witches in the neighbourhood, or if Sandie or Jeanie know any ghost-stories.

A recently published volume on the folk-lore of the west of Scotland (*Folk-lore, or Superstitious Beliefs in the West of Scotland within this Century*, by James Napier, F.R.S.E., F.C.S. &c. Paisley: Alex. Gardner, 1879) is deserving of notice, mainly because in it we have the notes of one who was born and bred among the popular beliefs and superstitions which in a green old age he has recorded for the information of students. We have therefore in reading his book a confidence in the accuracy of its statements, which cannot unfortunately be felt regarding all treatises on folk-lore. A tourist however painstaking and vigilant, is more than likely to make some mistake in noting down a local saying or tale. Owing to want of familiarity with the dialect, or possibly to acquaintance with kindred legends, his version is often, though unconsciously on his part, distorted and absurd. Folk-lore as a study requires rigid attention to the state in which a tale is

found; and in this as in other studies, there is nothing that ought to be more avoided than hasty generalisation. The labours of Professor Max Müller, Dr Tylor, Mr Ralston, and others have shewn indisputably the value to be attached to comparisons of many versions of one tale: and we may hazard the assertion that not only is the collector of folk-lore quite unjustified as a rule in drawing conclusions from his own investigations; but further, that it is impossible for any one who has not devoted time and talents to the special study of comparative folk-lore, and who has not at hand the fruits of other men's investigations, to speak with authority as to the worth or the worthlessness of a single note.

In the west of Scotland it was still an article of belief in days not very long gone by, that if an infant died before baptism its fate was only too certain; and the sighing of the wind among the trees was interpreted as the wails of unchristened bairns. If a stranger inquired what name had been chosen for a child, before baptism, the cautious answer given was: 'It has not been out yet;' for it was unlucky to call the child by any name. Great, therefore, was the anxiety to have the rite performed; and an instance is known of a baby born on a Saturday being carried two miles to church on the following day, rather than allow so long a space as a week to elapse. Great importance was attached to the choice of the woman who should carry the infant to church, to the manner in which the first person she met received the ancient gift of bread and cheese, and to the order in which the children were baptised; for if by any mischance Jeanie was christened before Sandie, Jeanie would have a beard, and Sandie would have none! Salt must have been familiar to the infant palate. Not only immediately after birth was the child bathed in salted water, and made to taste it three times, but whenever the mother took her baby to a friend's house for the first time, custom ordained that the person visited should put salt into the child's mouth and wash it well. But too great well-wishing was as dangerous as aversion, for the 'weel-faured' or well-favoured were most likely to be stolen by Queen Mab. No pains were spared to ward off the evil influence; and here we note that Mr Napier was himself thought to have had 'a blink of an ill e'e.'

'I have quite a vivid remembrance,' says he, 'of being myself believed to be the unhappy victim of an evil-eye. I had taken what was called a *dwinning*, which baffled all experience. . . To remove this evil influence, I was subjected to the following operation, which was prescribed and superintended by a neighbour "skilly" in such matters. A sixpence was borrowed from a neighbour, a good fire was kept burning in the grate, the door was locked, and I was placed upon a chair in front of the fire. The operator, an old woman, took a tablespoon, and filled it with water. With the sixpence she then lifted as much salt as it could carry, and both were put into the water in the spoon. The water was then stirred with the forefinger till the salt was dissolved. Then the soles of my feet and the palms of my hands were bathed with this solution thrice, and after these bathings I was made to taste the solution three times. The operator then drew her wet forefinger across my brow—

called scoring aboon the breath. The remaining contents of the spoon she then cast right over the fire into the hinder part of the fire, saying as she did so: "Gude preserve frae a' skaith." [Preserve him from all harm.] These were the first words permitted to be spoken during the operation. I was then put in bed; and, in attestation of the efficacy of the charm, recovered. To my knowledge this operation has been performed within these forty years, and probably in many outlying country places it is still practised.'

The evil-eye was the more to be dreaded since it was not necessary that the evil-worker should see the child—the only thing indispensable being possession of something which had belonged to the child, as a lock of hair, nail-parings, or rags of clothing. The theory was, that if one of these was buried in the earth, as it decayed, so slowly and surely would its former owner die, through some assumed association of part and whole, or *sympathy*. In order to guard against this, all hair and nail-parings were scrupulously burned. Many objected even to have their likeness taken; it was unlucky. Doubtless, some lingering fear suggested the evil use a badly disposed person might make of it; and Mr Napier speaks of having heard of several persons who never had a day's health after being photographed. Among other curious superstitions in the west of Scotland—though not all, as students of folk-lore know, peculiar to that district—respecting children, we are told that when a child was taken from its mother, and carried outside the bedroom for the first time after its birth, it was lucky to take it up-stairs; and if—as we suppose was not uncommonly the case—there were no stairs in the house, the child was taken three steps up a ladder—we know an instance of this recently in the west end of Glasgow—or in case of emergency, the nurse got upon a chair! Again, to prevent children being stolen by the fairies, an open Bible should always be placed near a child.

Regarding the aversion to May marriages, the very pertinent remark has been made, that a strong reason exists in Scotland in the fact that the Scottish removal or 'fitting' term occurs in the end of May, and what young woman would like to enter upon her married life unless she could in some measure be assured of her new home! Sixty years ago, the first thing done to prepare the house for the bride was, on the bridal eve, to sprinkle salt on the floor, as a protection against the evil-eye; then the bride's feet were washed, this being, as suggested, in all probability a survival of the old Norse custom which enjoined the maiden-friends of the bride to assist at a sort of religious purification. On the eventful day, which was always a Friday, great attention was paid to every incident; for if the bride broke a dish, or the postman forgot to deliver a letter to the bride until he was some way on his journey, and had to return, or some soot came down the chimney, it was a bad omen for the future wedded life. After the knot had been tied and the clergyman had kissed the bride, 'the party returned in the following order: first, the two fathers in company together, then the newly married couple, behind them the best-man and the best-maid, and the others following in couples as they might arrange. There were frequently as many as twenty couples. On coming within a mile or so

of the young couple's house, where the mother of the young goodman was waiting, a few of the young men would start on a race home. This race [as on a former occasion we informed our readers] was often keenly contested, and was termed *running the brooze* or *braize*. The one who reached the house first and announced the happy completion of the wedding, was presented with a bottle of whisky and a glass, with which he returned to meet the marriage procession; and the progress of the procession was generally so arranged that he should meet them before they arrived at the village or town where the young couple were to be resident. He was therefore considered their first-foot, and distributed the contents of his bottle among the party, each drinking to the health of the young married pair; and then bottle and glass were thrown away and broken. The whole party then proceeded on their way to the young folks' house. At riding weddings, it was the great ambition of farmers' sons to succeed in winning the *braize*, and they would even borrow racing-horses for the occasion.

When the bride had been lifted over the threshold, and her mother-in-law had broken the cake of bread over her head, she was led to the hearth, and the poker and tongs, and occasionally the broom, presented to her along with the keys of the house. These ceremonies ended, and a substantial supper partaken of, the young people turned to the dance, where, if either bride or bridegroom had elder brothers or sisters unmarried, those neglected ones danced the first reel without their shoes. (Scotch weddings, it must be noted, frequently take place in the evening.)

The rejoicing days over, 'the first care,' says Mr Napier, 'of the young married wife was still, in my young days, to spin and get woven sufficient linen to make for herself and her husband their *dead-claes* or shroud. I can well remember the time when, in my father's house, these things were spread out to air before the fire. This was done periodically, and these were days when mirth was banished from the household and everything was done in a solemn mood. The day was kept as a Sabbath.' Among the miscellaneous superstitions of daily life, it was said that if on seeing the first plough in the season, it was coming towards the observer, it was a lucky sign, and whatever undertaking he was then engaged in, would be certain of success; but if the plough was going from him, the reverse would be his fate. If luck was desired with any article of dress, it should be worn first at church. If a person in rising from table overturned his chair, he had been speaking untruthfully. If a man spoke aloud to himself, he would die a violent death. If nets were set on the Sabbath, the herring would leave the district (thus it is said the herring were driven from Lamnish about two years ago). If a double ear of corn were put over the looking-glass, the house would not be struck by lightning. For long it was customary for farmers to leave a portion of their fields uncropped, dedicated to the evil spirit, and called *goodman's croft*.

In the above notes, only a few of the superstitions illustrated in the volume to which we have had occasion to refer, have been touched upon. To give further examples would occupy more space than we can afford; and we must be content with remarking, that however we may now

regard these old-world sayings and doings, their study in a collected form may serve to illustrate the growth of the world's civilisation and the progress of man's mind.

DIFFICULTY OF VERIFYING HISTORY.

THE evidence on which historical statements rest is often found, on close and careful examination, to be woefully faulty. The real facts are ascertained to have been different in important particulars; or the conclusions drawn from them are greater than they can support; or no origin whatever for the statements can be traced. Grave discussions (for instance) have arisen within the last few years concerning the evidence on which the events and personages connected with the past history of England and Scotland are depicted by historians; we assuredly ought to know the truth on such matters, if attainable; instead of which, charges and counter-charges of error are freely brought forth. Other countries experience a like difficulty. For our own pages, however, the subject may be illustrated by examples which admit of being treated with a lighter touch.

At Puzzuoli, in Italy, is a convent which owns a fish-pond just outside the wall; and near the pond is a figure of a man who, according to legend, was struck blind while fishing there: a punishment for fishing in sacred water, or in a pond situated in consecrated ground. He was thus deprived for ever of the power of seeing the fish he caught. So far good; but it has been pointed out that the idea is traceable to a much earlier date, when there was certainly no convent at Puzzuoli. The Roman epigrammatist and poet Martial had long before given the self-same story, but applicable to a fish-pond belonging to the Emperor Domitian.

What did Lord Chief-justice Cockburn say concerning the handwriting which was brought in evidence during the far-famed Tichborne trial? Surely, it may be urged, there can be no doubt on such a point as this! And yet doubt there was, and perhaps still is. The reporters of most of the London daily newspapers took down the words with unquestioned honesty of purpose; nevertheless there were differences, chiefly in the use of small words and in punctuation, which led to two directly opposite conclusions—one that the learned judge declared two handwritings to be similar; the other that he had pronounced them to be strikingly dissimilar. The late Mr Thom, who introduced this matter in *Notes and Queries*, was twitted with having made a difficulty of it; but his reply was a good one—that the twitters virtually twitted one another.

When Baron Marochetti's equestrian statue of Richard Cœur-de-Lion was set up in Palace Yard, one of the newspapers informed its readers that King Richard, on his death-bed, commanded his attendants to lay him on the floor naked and flog him, as a wholesome discipline. They flogged him thoroughly, and then he died. A search in the old historians has failed to bring to light any other authority for this than that Richard underwent some discipline at the hands of the clergy.

During the Tobacco Controversy in the medical journals some years ago, one of the combatants declared that the great Sir Isaac Newton was a determined smoker. This set inquirers to work; and they found that the reliable biographies of

the great philosopher do not support this assertion. On the contrary Sir David Brewster says that 'when Sir Isaac was invited to take snuff, he declined either to smoke or to snuff, remarking that "he would make no necessities to himself."'

'Up Guards, and at 'em!' Much interest attaches to the controversy whether the Duke of Wellington used these words at Waterloo. It is agreed on all hands that his custom was to shelter his troops as much as possible from artillery-fire by taking advantage of such irregularities of ground as might present themselves. He caused the soldiers to sit or lie down till the moment of attack; and then, when the enemy appeared likely to advance, he bade them rise and be the first to attack. The general belief is that he did this at Waterloo. An officer of the second brigade of Guards, writing some years afterwards his reminiscences of that eventful period, stated that the Duke at the time was not in such a spot that troops could have heard him, and that the 'Up Guards, and at 'em!' was the invention of some writer more graphic than veritable. The curious part of the matter is that when Mr Wyatt long subsequently took a likeness of the Duke, as a preliminary to a statue, and asked him about the truthfulness or otherwise of the popular account, His Grace replied that he did not remember having used the words, nor could he remember what words he had really used. Certainly they are rather more melodramatic than suited the plain-speaking Wellington.

The French have a great tendency to cherish sayings and phrases which were uttered or are believed to have been uttered by celebrated men. This proneness is due in part to a pardonable kind of national vanity, and in part to a certain fitness in the French language to adapt itself to brief, telling, epigrammatic sentences and phrases. Multitudes of such examples are to be met with, found on sober scrutiny to lack verification; nevertheless they live, and seem likely to live in spite of criticism.

'La France est assez riche pour payer sa gloire,' is attributed to Guizot the statesman, when he signed a treaty of peace with a vanquished power without asking for a money indemnity. France has truly shewn herself, in recent years, to be rich enough to pay for defeat if not for glory; but the question is whether Guizot uttered the words attributed to him—words which brought upon him a taunt for boastfulness by the Opposition. It has been shewn that the phrase was put into his mouth by a French journalist—in fact a downright invention.

'La Garde meurt, et ne se rend pas!' said to have been exclaimed by General Cambronne, has in like manner been traced to a Parisian journalist; yet the French will doubtless continue to believe that the General, in relation to the condition of the famous Imperial Guard at a critical moment, heroically declared that the Guard would die rather than surrender.

'Fils de St Louis, montez au ciel!' The Abbé Edgeworth is said to have uttered these pious but somewhat venturesome words at the execution of the hapless Louis XVI. The Republicans who decapitated the king had of course no belief that they were sending 'the son of St Louis' to heaven; but the Royalists long cherished the idea

that the words had really been uttered by the Abbé. When questioned afterwards on the matter, however, he stated that the phrase was invented by the editor of one of the newspapers, and had not been used by him.

'Vive la République!' was the heroic shout of the crew of *Le Vengeur*, as she sank beneath the waves after a desperate hard battle. At least so the majority of Frenchmen believe. But the more sober among critics fail to find any evidence to shew that the unfortunate crew said anything of the kind.

'It is wrong for a man in a high station to revenge an affront suffered when he occupied a lower step on the ladder of life.' This, or something to this effect, was long attributed to Louis XIII, in reference to a wrong or an insult he had endured when Duke of Orleans. But the cruel critics have traced the magnanimous aphorism to an earlier date—the speaker being the Duke of Savoy, who prior to his ducal honours was only a Count. Shakspeare appreciated the sentiment well, when he made Henry V. behave with noble courtesy to the Chief-justice, who, in the days when the former was the roystering Prince Hal, had punished him for a misdemeanour; but the great dramatist did not put it into so sententious a form.

'All is lost except Honour,' was long believed in France to have been the sole contents of a letter in which Francis I. informed his mother of his defeat at the battle of Pavia; but when a recent examination of the king's letters was instituted, no such words were to be met with.

During the short Peace of 1814, when a hope was entertained throughout the greater part of Europe that the sun of the terrible Napoleon was set for ever, the Count d'Artois—afterwards Charles X.—entered France from exile in England. To please or appease persons who feared that stern measures would be adopted by the restored Bourbons, he is credited with having said: 'There is only one Frenchman the more: nothing is changed.' This became current on the authority of Count Beugnot. The speech was certainly neat and epigrammatic, as expressed in French: 'Rien n'est changé, Messieurs; il n'y a qu'un Français de plus.' It has been found, however, that the words were invented by a *littérateur* to adorn a newspaper account of Charles's public entry into Paris. The inhabitants of the gay metropolis rather liked poking fun at the somewhat obese Bourbon prince. Sir Robert Wilson, in his *Note-book*, speaking of a time when there was a general belief that the Count had really uttered the words imputed to him, narrates that when the once famous giraffe came to Paris, some of the wits made the animal say: 'Rien n'est changé, Messieurs; il n'y a qu'une bête de plus;' and that when the giraffe was taken to the palace at the king's command, the animal professed to be mortified at finding himself no longer the greatest *bête* in the kingdom. We must here bear in mind that *bête* in French frequently denotes dull, foolish, stupid—an additional sting in the arrows of the wits.

The time at which, and the mode in which the allied powers heard of the news which startled them all so greatly—the escape of Napoleon from Elba in 1815—have become the subject of a remarkable controversy, which tends to shew how difficult it often is to trace such matters to

their true source. The popular version is given in Sir Henry Bulwer's work on *Historical Characters*. On the 5th of March in the above-named year, while the Congress of Vienna was being held, a splendid ball was given at which most of the royal and distinguished diplomatists were present. A whisper gradually spread through the saloons to the effect that the dreaded enemy had escaped from his temporary island-prison. Prince Metternich suspected that Napoleon would at once march to Paris. The Duke of Wellington suggested that the Prince, as representative of Austria, should promptly draw up a proclamation, to be signed by all the powers, denouncing Bonaparte as a pirate and freebooter. M. Varnhagen, however, has recently ascertained that the scene in question did not take place at a ball. The historian wrote to Metternich, asking to be favoured with the real facts of the case. According to this account a conference of most of the plenipotentiaries lasted during the greater part of the night of March 6-7. Metternich, after two hours' sleep, was awakened by his valet, who handed him a letter marked 'urgent'; it came from the Austrian consul at Genoa. Metternich, wearied with hard work, left the letter unopened, probably not observing the word 'urgent.' Opening the letter two or three hours afterwards, he was startled at the contents. It comprised simply six lines, stating that the commander of an English vessel had called at the Austrian consulate to ask whether Napoleon Bonaparte had been seen at Genoa, as he had escaped from Elba. Metternich dressed and hastened to his sovereign the Emperor of Austria. The latter announced that he would at once send an army into France, and bade his minister ascertain whether Russia and Prussia would do the like. In one single hour all the three sovereigns had agreed, and had seen Field-marshal Prince Schwarzenberg about the command. By ten o'clock orders were transmitted to three armies.—At a midnight ball on March 5, and in the Austrian minister's bedroom at eight o'clock on the morning of the 7th, are obviously incompatible; and thus Varnhagen claims to have corrected a popular error which had deceived Bulwer as well as other writers.

In an article relating to the question whether and to what extent 'History repeats itself' (inserted in this *Journal* for March 15, 1879), reference is made to the Rev. George Harvest, a clergyman whose erudition was more than equalled by his eccentricities. In sheer absence of mind he threw his watch instead of a pebble into the Thames. There is something so marvellously like this in one of Addison's papers in the *Spectator*, that one's suspicions are excited. Will Honeycomb's Club and Mr Harvest's Club; Somerset Gardens and the Temple Gardens; seven minutes to spare in each case; the picking up of a curiously shaped pebble; the intention to shew it to a virtuoso; the pocketing of the pebble and the flinging away of the watch—coincidences beyond measure strange. We have deemed it not unprofitable to dip into this matter a little. *Notes and Queries* quoted the anecdote of Mr Harvest from the *Rock* newspaper, and at the same time drew attention to its resemblance to the *Spectator* anecdote. The *Rock*, we find, gave no authorities. A little search has brought under our notice two biographical tracts or pamphlets, published early in the present

century, each giving in full the anecdote of Mr Harvest. He was, it appears, incumbent of Thames Ditton in the second half of the last century. His death is noticed in some of the London periodicals for 1781; but we have failed to trace the story of his watch and pebble farther back than thirty years after that date. As the two tracts or pamphlets are anonymous, we have no hesitation in stating our belief that some writer (name unknown) concocted the story out of materials which he found ready to his hand in the *Spectator*.

This question of Mr Harvest may seem trifling in itself, but it affords a good example of some of the difficulties which arise in verifying history.

THE STORY OF A SPEAR.

AN oriental-looking weapon decidedly; indeed any one familiar with antique Eastern arms will recognise it at once as one of the pikes formerly carried by running footmen in India. It is of iron, plated with silver, in rings, to give a firmer grasp. It is rather more than six feet in length, and has a triangular blade more than twenty inches long, with sharp edges. A formidable weapon unquestionably, in skilful and resolute hands. Among a host of other oriental curiosities in a certain west-country English mansion it occupies a conspicuous place of honour. It is regarded indeed with a singular veneration—as well it may be; for on the 14th of January eighty years ago there was done with that spear a deed of prowess which stands unique even in the long and brilliant record of British valour—a deed which proves, if proof were needed, that the civilian can in emergency play the hero as effectively and successfully as the trained soldier. The story of that spear we purpose telling here.

The scene of the story is laid in the holy city of Benares, which was at that time, to use the words of Macaulay, 'in wealth, population, dignity, and sanctity among the foremost of Asia. It was commonly believed that half a million of human beings were crowded into that labyrinth of lofty alleys, rich with shrines and minarets and balconies and carved oriels to which the sacred apes clung by hundreds. The traveller could scarce make his way through the press of holy mendicants and not less holy bulls. . . . Hundreds of devotees came thither every month to die; for it was believed that a peculiarly happy fate awaited the man who should pass from the sacred city into the sacred river. Nor was superstition the only motive which allured strangers to that great metropolis. Commerce had as many pilgrims as religion. All along the shores of the venerable stream lay great fleets of vessels laden with rich merchandise. From the looms of Benares went forth the most delicate silks that adorned the balls of St James's and of Versailles; and in the bazaars, the muslins of Bengal and the sabres of Oude were mingled with the jewels of Golconda and the shawls of Cashmere.' But Benares was not only the gathering-place of merchants and pilgrims, it was also the resort of all the maddest fanatics and most

desperate adventurers in India. The hardy rabble of its streets, ready at a moment's notice to rush to arms, were very handy auxiliaries to any bold political conspirator—and there was never any lack of such refugees in the holy city.

Now, among all the turbulent spirits that kept Benares in a ferment during the year 1798, by far the most conspicuous and mischievous was Vizier Ali, the recently deposed sovereign of Oude. He was but nineteen years of age, and had only enjoyed the sovereignty for the brief period of two months, when he was summarily ejected. It is necessary, in order to understand the incidents of our story, to explain briefly who and what this Vizier Ali was. He was the putative son of Asaph ul Doulah, Nabob-vizier of Oude, a mere creature of the Company, who had died in 1797. On his death there were two claimants to the vacant throne: this putative or adopted son, whom the late Nabob-vizier had publicly recognised and acknowledged; and Saadut Ali, the eldest surviving brother of the deceased sovereign. Sir John Shore—afterwards Lord Teignmouth—the then Governor-general, at first rashly recognised the claim of Vizier Ali; but two months later had to revoke his recognition, and admit the superior validity of Saadut Ali's claim. The latter was accordingly brought from Benares to Lucknow, and proclaimed Nabob-vizier of Oude on the 21st January 1798; whilst Vizier Ali, to console him for his disappointment, was granted a pension of fifteen thousand a year and a palace at Benares. So leniently was the young prince treated, that no attempt was made to control or restrain his movements. He was permitted to keep regal state and surround himself with a large retinue of armed adherents—to maintain, in short, all the external appearance of an independent sovereign.

The folly and imprudence of allowing Vizier Ali to live in this style in such a city as Benares, within the confines of the very state of which he believed himself to be the rightful ruler, was presently to become fatally apparent. He was a bold, ambitious, unscrupulous young man, of fierce passions and headstrong will; and though vicious and debauched, was exceedingly popular among the rabble on account of his profuse liberality. Indeed, he was in the act of plotting the overthrow of British power in Oude, when one of his secret envoys, intrusted with treasonable despatches to Zemaun Shah, was seized by the Company's police. The detection of his intrigues was quickly followed by an order from the Governor-general for his removal to Calcutta. He was to be allowed to retain his income and his state; but it was felt that the only way to neutralise his mischievous propensities was to keep him under the strict surveillance of the British authorities and isolated from his fellow-conspirators. It remained now to announce to Vizier Ali this order, which must be a death-blow to all his ambition. And at this point it becomes necessary to introduce the two important characters who figure most prominently in the story of the spear.

At a short distance out of the city of Benares there is a pleasant suburb called Secrole, which the European residents—the majority of them English—had chosen as their quarters. Their houses, which stood usually in the centre of con-

siderable grounds, were built after the English style, with such modifications as the difference of climate necessitated. There was seldom more than one story above the ground-floor. The flat roof, however, afforded space for an extensive terrace, surrounded with a parapet, and approached by a single narrow winding staircase, from the top of which a trap-door gave access to the roof. It is requisite that these details of construction should be borne in mind in order to understand the main incident of the story. In this suburb, within a quarter of a mile of one another, lived at the time of this narrative the two chief civil authorities of the Company at Benares—Mr Cherry, the political agent of the Governor-general, and Mr Samuel Davis, judge and magistrate of the district and city court. Mr Cherry, from the nature of his duties, was necessarily brought sometimes into personal contact with Vizier Ali; but with this exception, the haughty young prince held no communication whatever with Europeans. Upon Mr Cherry devolved the necessity of announcing to Vizier Ali the order of the Governor-general directing his immediate removal from Benares to Calcutta. The political agent was unfortunately a good tempered, easy-going man of a singularly unsuspicious nature. From the very first he had been completely hoodwinked by the wily young Vizier Ali, in whose honesty and good faith he implicitly believed. When, therefore, the first ebullition of rage at the announcement of the Governor-general's order was succeeded by humble submission and a declaration of the Vizier's readiness to leave Benares as soon as his travelling arrangements could be completed, poor unsuspecting Mr Cherry took it for granted that there would be no further trouble about carrying the order into execution.

Mr Davis, on the other hand, was a man of sagacity and penetration, who knew the treacherous nature of orientals too well to be duped by professions of friendship and loyalty, and who had besides, from information supplied through his police agents, the best possible reasons for distrusting Vizier Ali. It was he who discovered that there had been secret negotiations with Zemaun Shah, and it was owing to his emphatic representations that the Governor-general was induced to issue the peremptory order of removal. He had repeatedly warned Mr Cherry too; but that infatuated person would believe nothing to the discredit of Vizier Ali.

On the evening of the 13th of January 1799, Vizier Ali sent a messenger to Mr Cherry announcing his intention of visiting the political agent the next day 'at the hour of breakfast.' On the morning of the 14th of January, as Mr Davis was taking his customary ride on an elephant, he saw Vizier Ali, accompanied by a train of some three hundred horse and foot, pass on his way to the residence of Mr Cherry. As there was, however, nothing unusual in the sight, for Vizier Ali was always so attended, the judge thought nothing more of it at the time. But on his return home from his ride he found his *cutwal* or head of police awaiting him in a state of great perturbation with the news that he had just received sure information that Vizier Ali had despatched emissaries over the whole of Oude summoning armed men to his standard, and that he feared the Vizier's visit to Mr Cherry had some sinister

object. Mr Davis at once sent a hasty note to Mr Cherry, and waited in much anxiety and impatience for the reply. It was not long in coming; but in a very different form from what he anticipated. First there was a great cloud of dust, then a confused sound of shouts and cries, then the tramp of many feet, then a glimpse of men and horses and glittering steel. The solitary sentry at the gate, fifty yards from the house, challenged the advancing crowd; his challenge was answered by half-a-dozen musket-shots, and with a ferocious yell the mingled medley of horse and foot rushed over his corpse towards the house. There was murder in that yell, and the judge knew it; but his heart never quailed, nor did his presence of mind for a moment forsake him. He ran to his wife's apartments, bade her flee like lightning with her two children and her female servants up the winding staircase and through a trap-door to the roof; then dashed back for his firearms, but only to find the room in which they were, filled with the fierce followers of Vizier Ali. Remembering that there was a spear in one of the rooms above—think of the cool-headedness of the man, so unflustered by the danger that he could remember this!—he had just time to snatch the weapon from the wall and gain the trap-door when he heard the quick tramp of his pursuers close upon his heels. Turning to the terrified women and children, he bade them lie down flat in the centre of the roof, so that no stray bullets might reach them, told them to remember that General Erskine's camp was not ten miles away, and that without doubt help was even now on the way to them; then, spear in hand, and kneeling on one knee, he took up his post at the trap-door, resolved to hold that coign of vantage so long as life and strength were left him.

The staircase was a peculiar one, winding round a central stem, supported by four wooden posts, open at all sides, and so narrow as to allow only one person to ascend at a time. The trap-door which communicated with the roof was like a hatchway on board ship, and the judge kept it open, that he might have a fair view of his assailants as they came up to the assault.

He was not long kept in suspense. Rapidly the ascending footsteps approached, until the head and shoulders of a man appeared. It was Izzut Ali, one of the bosom friends of Vizier Ali, who sword in hand confronted the intrepid judge. For a moment Izzut stopped short, eyeing the figure above him, and then burst into a storm of abuse and execration. Having exhausted his stock of anathemas, he made a rush forward.

'Back, you scoundrel!' cried the judge; 'the troops are coming from the camp.'

Izzut Ali gave a derisive laugh, and struck fiercely with his sword; the blow was parried, and a thrust from the spear transfixed his arm. With a howl of rage and pain the first assailant fell back. Others pressed furiously forward from behind; but one after another they were sent back foiled and wounded, till no one cared to face that deadly spear-point and the strong arm that wielded it. Then they began to fire at the gallant defender of the stairs; but fortunately the peculiar construction of the staircase prevented them from taking good aim, and the balls went crashing harmlessly into the ceiling.

After a long fusillade it was resolved to make

one more effort to storm the trap-door; and this time the judge had a narrow escape. The first of the storming-party was a big powerful man, who dodged the thrust made at his head, and caught the spear-point in his strong grasp. It would have gone hard with Mr Davis had not the blade been triangular with sharp edges. But when, exerting all his force, he gave a desperate pull, the sharp edges cut through his antagonist's hands, inflicting severe wounds, and the spear was jerked out of his gripe. After that, no one ventured to come to close quarters with the judge, and his assailants contented themselves with keeping up for some time a desultory and harmless fire. Finally, they grew tired of this waste of ammunition, and proceeded to wreak their vengeance upon the judge's furniture, as they could not reach his body. After they had smashed up everything they could lay their hands upon, there was a mysterious and unaccountable silence. Not a sound of any kind was to be heard. Had the foiled assassins given up the attack in despair, and gone to seek other and less formidable victims? One of the female servants cautiously peered over the parapet. A shower of bullets rattled round her in an instant, and one of them pierced her arm. It was clear then that the house was surrounded and vigilantly watched. Again all was silent. The judge dared not leave his post of vantage to reconnoitre, though the silence was more trying than the noise. Could they be going to fire the house, and give the hapless inmates but the choice between massacre and burning?

Two hours had elapsed since the first assault upon the trap-door; surely the news of the rising must have reached Erskine's camp, and troops must be on the way to Benares. Suddenly the silence was again broken; there was the sound of footsteps, ascending the staircase. Once more the judge set his teeth, grasped his spear, and prepared to sell his life dearly. The steps came nearer, then a turbaned head appeared. In another instant the upraised spear would have been driven through the turban into the skull beneath it, when the intruder lifted his head and shewed the white beard and withered face of one of the judge's own body-servants. Fearing treachery, however, Mr Davis kept him at bay until he was assured that the party consisted of friends. He then descended, and found the new arrivals to be fifteen sepoys and a few of his own police. As the sepoys were armed with musket and bayonet, and had fifteen rounds apiece, the judge felt that he was now equal to standing a siege, and heard without dismay that Vizier Ali was preparing for another attack in greater force. Meanwhile he inquired if anything had been heard of Mr Cherry. He was told that to the best of his informant's belief Sahib Cherry and all the Englishmen with him had been killed. The judge was still musing over this melancholy news, when he was roused by another alarm, the rattle of sabres and the clatter of horses' hoofs. A hurried glance from the window, however, set all his fears at rest; for in the new-comers he recognised a troop of cavalry from Erskine's camp. The first hearty greeting over, the officer in command briefly explained that immediately on the receipt of the news of Vizier Ali's insurrection, he had been ordered to hasten forward with his

small force, and announce the approach of reinforcements. They had ridden first to Mr Cherry's; and there they found the house sacked, and the dead bodies of Mr Cherry and four other Englishmen lying mutilated in the grounds. Then they hurried to Judge Davis's, expecting to find a similar horrible spectacle awaiting them there; but were overjoyed to discover that here at least they were not too late. Little more remains to be told. All danger was now over. A strong force under General Erskine arrived shortly afterwards; and though there was some severe street-fighting, yet before nightfall, Vizier Ali's palace was stormed, his followers dispersed, and order restored in the city. The arch-conspirator himself, however, escaped, and at the head of a band of marauders made himself troublesome for a few months on the frontier; but was eventually betrayed to the English by the Rajah of Jeypore, with whom he had taken refuge, and kept in close confinement till his death.

By a curious coincidence, Vizier Ali was brought into Benares a prisoner on the anniversary of the memorable day which had witnessed the massacre of Mr Cherry and the heroic defence of Judge Davis.

As for the gallant Horatius of the staircase, he received the due meed of his valour. His grateful fellow-countrymen at Benares hailed him as their saviour from a cruel massacre. And the Governor-general, the Marquis of Wellesley, wrote expressing his high admiration of the splendid courage and coolness displayed by Mr Davis on that occasion; to which alone, he said, 'was to be attributed the safety of the English residents, and the salvation of the city from pillage.' For there could be no doubt that by holding the Vizier and his forces at bay for two hours, the judge enabled the other European residents to make their escape to General Erskine's camp, and kept the insurrection from spreading into a serious and formidable rebellion. Nor was there wanting more substantial recognition of the judge's gallantry and resolution. He was shortly afterwards removed to Calcutta, where he was promoted to a post of high honour and emolument. And at the time of his death he was one of the most respected and influential Directors of the great Company whose interests he had so faithfully and bravely served.

At the mansion of Hollywood, near Bristol, the seat of his son Sir John Francis Davis, who for his distinguished services in China received a baronetage in 1846, the spear which figures in this story is still preserved with the deepest veneration, and will doubtless be handed down as a cherished and precious heirloom from generation to generation of the descendants of Samuel Davis. Cheeks will glow and pulses quicken as the story of that memorable feat of arms is told. Nor is it only in the family of the hero that these feelings of sympathetic pride and enthusiasm will be stirred. In some degree at anyrate, would we hope that they may be stirred in the heart of every reader of this narrative. And who can tell but that some stout-hearted Briton who shall hereafter find himself in forlorn straits, may take fresh courage from the recollection of the brave judge of Benares, who with his single spear held the staircase against three hundred foes! For never surely was there a story yet that more forcibly pointed the moral

that 'While there's life there's hope;' and that even the most desperate game may be pulled out of the fire by dauntless determination and patient courage.

COOLIE IMMIGRANTS IN BRITISH GUIANA.

IN a recent number of this *Journal* we laid before our readers a Glimpse of Overseeing in Demerara; and we would now say something about the coolie labourers employed on the plantations in that colony.

Among a certain class there exists a prejudice against the introduction of East Indians, male or female, into Demerara and the other West Indian colonies. Obstacles of every conceivable kind have until quite recently been thrown in their way, and it has even been alleged that on the arrival of coolies in the colony they are not only overworked and underpaid, but that they are subjected to every hardship possible to imagine. These statements are really nothing else but calumnies, as the writer, who has had experience of a planter's life for some years, and been in daily personal intercourse with the coolies during that time, can testify.

The plantation-work of Demerara being well suited to the capacity of East Indian (Coolie) labourers, thousands of them seek their fortunes in the colony. On their arrival they are distributed among the planters by the Immigration Agent-general acting under the Governor; the number being regulated according to the application of each planter, his means of providing for them, and his willingness and ability to pay the cost of the immigration by periodical instalments. The coolies on being assigned to an estate are at once put under a contract or indenture to work there for five years. At the expiration of this period they are free, and can return to their native country if they like, being entitled to a gratuitous passage home. While subject to this contract they are bound by law to work, unless prevented through illness; and should any try to evade their contract, by desertion, shirking, or other means, they render themselves liable to be summoned before the district stipendiary magistrate, who may fine or imprison them. The time spent in jail as a punishment for idleness is registered against them in the estate books. At the expiration of the five years' term of service, any period a coolie has thus spent in jail has to be made good before he is entitled to receive a certificate of exemption from labour.

The manager of an estate is obliged to have work always ready for his labourers, and to pay them for it weekly at stipulated rates, which are nearly similar all over the colony. The men often earn two and three shillings a day; and when it is taken into consideration that the estate finds them a good lodging, and that a single man seldom spends more than four shillings on his sustenance during a week, the remuneration is usually considered ample. Moreover, the official returns issued by the Immigration Agents in

Georgetown and Calcutta shew that large sums of money are carried back to their country by returning immigrants, after their term of service has expired.

The coolies are able at any time to lay a complaint of bad treatment, insufficient wages, overwork, or any other grievance under which they may believe themselves to be suffering, before a local magistrate or Immigration Agent; and these complaints are always sifted to the bottom, and if found true, redress is immediate. In fact so warmly has the head of the Immigration Department been their defender and partisan, that he is nicknamed 'the coolies' pāpā.' In cases of alleged hardship, the coolies will carry their grievance to headquarters, and it is by no means an uncommon spectacle to the merchants and store-keepers of Georgetown to see fifty or sixty coolie labourers appear in Water Street on their way to the Immigration Office. They have come from some estate in the country, armed with their shovels and forks, just as they have struck work, to lay a general complaint against the manager, overseers, and foremen of the estate to which they belong. Usually, the sum and substance of their complaints is that they are not paid sufficiently for their labour, and that they would like some little addition to their wages.

The complaints, whatever they be, being carefully taken down in intelligible language, the men are told to return to their work, and that an investigation will take place on the morrow. The next day, the manager of the estate gets an official intimation that such a charge has been made, and that Mr T— will arrive at a stated time to investigate the case. The Agent arrives; the coolies renew their charge, but with less vehemence and more regard to truth, now that they are in the presence of their masters. The manager refuses to increase their pay, alleging that what has already been promised them is a fair equivalent for their work. A visit to the field where the work in question has been commenced takes place. It not infrequently happens that the Immigration Agent finds himself unable to come to a decision from his ignorance of planting details; and in such cases, four well-known planters are summoned—two chosen by the manager, and two by the coolies. Both parties then agree to decide by their judgment. With every wish to decide in the immigrants' favour, it is seldom that the Immigration Agent finds himself able to do so, for the simple reason, that as a rule the work is found to have been fairly valued, and at similar rates to those paid on neighbouring estates at the same time. The regular monthly visit of the Immigration Agent also affords the coolies opportunities of bringing complaints, thus saving them the time and trouble a walk to the town or magistrate's residence would entail.

The immigrants' time of work is limited by law to seven hours a day in the open air, and ten hours a day under cover in the manufactories; if, however, they like to work a longer time for extra pay, they are open to do so, and most of them gladly avail themselves of this right, by which they secure more wages at the end of the week. The children are free from birth, and when grown up usually develop into the most useful and skilful labourers. As a further inducement to the immigrants to work well, they are entitled to a

day's leave provided they labour with tolerable steadiness; and an industrious man or woman never asks in vain for two or three days or even a week's leave, supposing they wish to travel to a distant part of the country. Their children are formed into gangs, and employed at light easy work about the manufactory, or in the fields, being paid from sixpence to tenpence a day according to their age and ability.

The labourers on all estates are under the immediate supervision of several foremen, called 'drivers.' These men are coolies themselves, and are specially selected by the manager of an estate as men of superior intelligence and strength, and as having shewn themselves thoroughly acquainted with and able to perform the different descriptions of agricultural work they will have to superintend. These men are in receipt of fixed wages, and enjoy many agreeable privileges. It is their duty to stop all disputes, report everything wrong that may come under their notice, and be all day long with their fellow-immigrants in the fields, superintending their work, besides having to accomplish a host of minor duties. To rise to this position is the great ambition of most coolies, and the hope of one day becoming a driver acts as a very healthy stimulant to induce them to increase their industry.

There must be a hospital on each estate for the labourers, and a regular doctor; and when ill, and consequently inmates of this hospital, the coolies receive medical attendance, medicines, and food gratis. Properly qualified men called 'sick-nurses' have charge of these hospitals, and always live on the premises. The doctor visits three or four times a week, and in serious cases once or twice a day if need be.

The chief difficulty the coolies experience is in their acclimatisation and in recovering from the attacks of colony fever—not yellow fever—which is certain sooner or later to prostrate them, or anybody else, after their arrival in the colony.

Now we will suppose the first four months of a man's indenture passed; he has recovered from his worst attacks of fever; his hands have hardened, allowing him to grasp his *cullas*—a Demerara agricultural implement—without pain or blistering; he has learned tolerably well how to perform the different kinds of work, and has settled down to his new life just as a boy at school does after his first term. As for the first three or four months after their introduction the coolies are not sufficiently acquainted with their work, and might find it difficult on this account to earn a fair week's wages with which to support themselves, it is the custom for new coolies to be fed by the estate for the time being. They receive a good meal twice a day, and get biscuits and tea early in the morning. Were a man, therefore, at first only to earn as little as sixpence a week, he would not starve in consequence. The food is generally served out already cooked. Two and fourpence is deducted from each immigrant's weekly wages to pay for this food; but supposing that any man or woman has not earned so much, the estate is the loser, as the amount short is not carried on against them into the next week, but foregone at once.

Generally speaking, the coolies arrive from Calcutta almost destitute, and though perhaps they may experience rather a hard time of it for the

first four or five months after their introduction, so satisfied do they at length become with their lot, that as a rule they abandon all idea of returning to their native country, and ultimately settle down in the colony, as may be seen by the numerous coolie villages generally situated near large estates in the country. Even before their indentures have expired the men invest largely in cattle, and their wives invariably keep poultry or goats. A stranger landing in Georgetown cannot fail to be struck by the cheerful and happy aspect of the coolie men and women he meets as he walks along the streets. The Indian look of the place is heightened by the appearance of the population, the streets being filled with coolies in the picturesque garb of the East, with their wives in their bright dresses, their arms, ankles, and often ears and noses loaded with gold and silver jewellery, and their children in the garb of Eden.

Before concluding this paper, I must say a few words about the annual festival of the coolies, called the *Taga*, to celebrate which they are allowed from three to six days' leave. This festival usually takes place at the end of January or beginning of February, and preparations for it are commenced months before. The ceremony consists of the coolies carrying about the country structures made of bamboo covered with different kinds of coloured paper, which they call temples. The coolies of each estate attire themselves in bright apparel, and vie with one another in the size and gaudy magnificence of their temples. While these are being carried about by night at the head of long processions of coolies bearing torches, fencing, boxing, and other feats of strength are resorted to. The festival lasts two or three days, and is much looked forward to; as a rule, however, planters do not much encourage it, as after the third day a great deal of drinking goes on, and the immigrants do not recover from their exertions and excesses for weeks afterwards; moreover, its celebration has not unfrequently led to a free fight taking place between the coolies of two neighbouring estates, which has sometimes ended fatally for some of the rioters. However, it comes but once a year, and as it is the only real holiday these people enjoy, it seems hard to grudge it them. The most amusing part is that, on the last day of the festival, the temples and gorgeous structures upon which they have spent so much time and money are thrown into the river or into some old ditch, where they are left to rot and fall to pieces. In such places these remnants of departed grandeur may be seen for months afterwards.

In bringing this paper to a conclusion, the writer hopes that to any one who has had the patience to follow him so far, it will be tolerably clear that the coolies who leave Hindustan to try their fortunes in Demerara, are not subject to the persecutions and hardships supposed by many to be their lot. Looking at the subject from a thoroughly worldly point of view, it pays a planter much better to treat his coolies as human beings, susceptible of feelings like ourselves, than like wild beasts; and this the planters know perfectly well. So long as there is a constant and steady flow of immigration from India, Demerara is secured of prosperity; but once let this introduction of labour into Demerara cease, the wages which would be demanded for native labour would render it impossible for the planter to carry out

his operations with anything like success. Immigration, then, is as the lifeblood in her veins, endowed with which, Demerara is reserved for a great life in the future.

IRISH TRAITS.

MARY'S ABBEY, F—LANE, ETC.

A MODERN writer—A. M. Sullivan, author of *New Ireland*—has remarked upon 'the greater seriousness of character which the famine period has imprinted on the Irish people;' and no one who knew them well, and was familiar with their manners and habits before the 'black forty-seven,' will fail to indorse the truth of this observation. The once reckless taking-no-thought-for-the-morrow, living-from-hand-to-mouth system, has in a great measure gone out with the exclusive potato diet; but notwithstanding the diminution of improvidence and increased 'seriousness,' much of the old characteristic remains. The light-hearted fun, the keen relish of a joke still so prevalent, strike one, especially after an absence from the Green Isle.

Very noticeable was this to a small party of travellers who a few weeks since landed in Dublin from one of the North Wall steamers, having been absentees from the Green Isle for some considerable time. The boat was very full, and the moment the gangway was let down, the majority of the passengers pressed eagerly towards it.

Why is it that travellers, who surely cannot *all* want to catch a train or secure the best rooms at a hotel, and to whom, therefore, a few minutes sooner or later cannot be a matter of vital importance, *will* crowd and push and squeeze, getting themselves elbowed and jostled as they are propelled forward by the throng, bumped up against knobby packages, hand-bags, umbrellas, sticks, dressing-cases, and all the various articles where-with passengers encumber themselves, and over which in the jam and crowd they have no control?

Our travellers elected to stay quietly behind until the rush had subsided, so that when they emerged from the *Shamrock*, the quay was comparatively deserted, and only a few cabs were left. Along the line of these, among the cabbies, some rare and wonderful joke was passing. Peal after peal of laughter followed each sally as it flashed from one driving-seat to another. A man whose cab was just before the brougham where our friends sat waiting for their luggage, actually wriggled with delight at some extra-pungent repartee, drumming his feet on the footboard in an ecstasy of appreciation, and causing his sleepy horse to rouse from his doze and prick up his ears. The joke, whatever it was, had not died out when the cabbies, despairing of more fares—their spirits in nowise damped thereby—drove away, firing off parting shots of mirth-provoking fun with many a backward flourish of the whip at those left behind. The party, fresh from the sedate Jehus

of Euston and Paddington, were fain to confess that Paddy could still be sometimes 'himself again.'

But it is in the fairs and markets, the back-slums of towns, and wherever the lower orders congregate to buy and sell, that national characteristics most abound; and very droll they sometimes are.

Mary's Abbey in Dublin, frequented by customers of this class, affords many examples. Goods of various descriptions are ranged along the edge of the road-way in baskets, barrows, trays, and stands of temporary construction. Here a table of old clothes, brushed and furbished up to the best advantage; next crockery-ware; then a tray of gaudy artificial flowers, round whose splendid attractions, with longing eyes the young girls cluster, like bees about a lavender-bush; some of the damsels exceeding comely and good to look at. Cheap fish, not always the freshest; fruit at times ditto ditto; strings of onions, old nails, penny toys; smart muslin caps, knitted stockings, and bright-coloured woollen mufflers dazzling to behold; clay-pipes, sacks of potatoes, rows of second-hand boots and shoes, wooden ware.

Here is a man shouting out at the top of his voice: 'Three silver spoons for a halfpenny! Come and buy, ladies. Who'd keep on stirring their tay wid the bone of a herring, when they could buy three splendid silver spoons for wan halfpenny? Stand back there, gentlemen'—to the crew of ragged young street arabs pressing round—'stand back, if ye plaze, and don't crowd the ladies. Don't ye see they want to examine the plate?'

Farther on—in P—— Lane, a unsavoury region chiefly devoted to fish—a group of women are squatted round one presiding over a basket of herrings, listening eagerly while she narrates how Big Moll was 'run in by the poliss—she having a dhrop in her the same time.'

'And sarve her right,' adds the speaker viciously. 'There isn't one in all Ireland handier with her fists and her tongue nor herself. Last Christmas, she and I had an argyment in Moore Street, and I guv her the lie before the whole market. With that, my dear, she ups with a big pot-stick was in her hand, and without another word she downs me. I thought I was kill't. Biddy O'Shea run up. "Vo, vo! Mrs Brien ma'am," she calls out, "are you dead?" "No jewel," sez I; "not dead; only spachless." For I couldn't spake, with the stun I was after gettin' when I was stretched. At last I come to, and struggled up be degrees; and away with me to Jervis Street Hospital wid my head in my hand to the doctor. He done the best he could, and plaistered it up. But ever since, and more especial when there's a change in the weather and rain coming on, there does be a humming and a bizzing and a buzzing in it, as if a whole swarm of honey-bees was working away in th' inside. Never fear but what I made the lady sup sorrow for what she done; summonsed her before the magistrate, and got her two months—I did!'

Beyond these sits a wizened, meek-faced little woman keeping guard over a tray of doughy cakes.

She wears a shabby brown shawl; and stuck on the top of her grizzled head is a morsel of a bonnet, all lace and feather and gossamer, that evidently has surmounted, at fête or garden-party, the dainty *chevelure* of youth and beauty, before—in the vicissitudes clothes are heir to—it came down, draggled and defiled, to P—— Lane. The effect in its present position is grotesque in the extreme.

'Lovely cakes!' cries the wearer of the faded finery; 'beautiful and fresh, baked this morning. The smell of 'em coming out o' the oven would rise your heart. I just laid the dish on the kitchen floor for one minute; and the black beetles, when they got the lovely whiff of it—'tis they're the lads that knows what's good, and small blame to 'em—come swarming round in hundreds an' hundreds; you'd think 'twas a funeral was there. Just see the flies now, settling down and spotted all over the top, as if they was currants. Take one, acuishla;' this to a starved-looking little girl with a puny child in her arms, who is eyeing wistfully the tempting delicacies, and about to cower shyly away as she catches the eye of their owner.—'Ye haven't got the coppers; is that it? What matter! I'll be paid in heaven. And give a mouthful to the babby; he looks hungry enough, God help him!'

'Potaties! Arrah wisha now, d'ye tell me ye have the face to call *them* potatoes? Marbles is what I'd call them. Why, woman alive! they're that small, a goose would be ashamed of itself that couldn't swallow them whole!'

'Look at mine, will you!' shouts a neighbour, opening wider the mouth of a sack; 'beauties! Them's what you may call praties, and no mistake. Top of the market—thumpers! Sure they're finer this saison—glory be to God!—nor we've had them since the year of the great rot. So big that they were scrooging one another out of the ground; the little ones crying out to the big fellows to lie over and lave them room to grow.'

The right of husbands to inflict personal discipline on their weaker halves seems to inspire the latter with extra respect for their lords and masters. One who does not assert it when there is due cause, is apt to be looked down upon by the ladies of P—— Lane.

'That's a fine black-eye you've got, missis,' says a man to a gaunt beldam who comes striding along, a fish-basket at her back. 'Fightin' again, I suppose, eh?'

'No; I wasn't fightin'. Himself it was gave me that.—And I'd like to know,' facing fiercely round on the questioner—'I'd like to know who had a better right?'

'A pretty sort o' man *you*, to spake in that way!—Look neighbours, he tould the wife—threatening-like—that he'd bate her as black as a mourning-coach if she'd attempt to go again his ordhers. *Him?* He dar'n't. He hasn't the sperrit of a field-mouse. If she got the stick, as she ought, 'twould do her good; a born divvle, as she always was. Didn't I see her with my own eyes break two eggs upon his face one time they had a differ about something? *He* bate her, indeed!'

A gentleman appears, threading his way through the lounging chaffing idlers, and groups of eager busy buyers and sellers. He is bound for the Four Courts, and making through P—— Lane a

short-cut. General attention is fixed on 'the Counsellor.'

'Faix, if you had all the larning that that one has under his hair, you might considher yerself a wise man.'

'I'd sooner have the money he has in his purse.'

'More fool you then! Sure 'tis with their brains the likes o' them fills their pockets.'

A beggar-woman has espied the pedestrian, and straightway fastens on her prey. Shuffling along to keep up with his hurried footsteps, she follows him pertinaciously the whole length of the street, whining forth complaints and supplications in the face of repeated refusals. At last his patience is exhausted. He turns angrily on his tormentor: 'You have already got your answer. I never give to beggars in the street!'

'You don't sir, don't ye? give *in the street*? Och thin'—changing her tone to one of ironical politeness—'sure if I knew where yer honour lives, and if you'll just tell me your address and the number of your house, I'll call upon you an' welcome. Faix, I will, with all the pleasure in life, call any day you appoint for whatsoever 'twill be plazing to yer worship's honour to give me.'

The cool humour of her speech, ignoring the gentleman's angry irritation, and affecting to misunderstand his meaning, elicits transports of delight from the grinning audience.

There are some persons to whom queer things are often happening. Or is it that having a turn for humour, they see it, where others fail to perceive the ridiculous? G—— was one of these. Arriving in Dublin rather suddenly on one occasion, he found there was to be a Drawing-room at the Castle that night; and meaning to go, he directed his servant to put out his court-dress in readiness. Up to the throne-room he was making his way through the usual crowded throng and the usual baking heat, from numberless lamps and numbers of warm fellow-creatures, when he was taken with a violent fit of sneezing. Among the slowly moving multitude, acquaintances and greetings dropped up.

'G——, my dear fellow, I'm so glad to— Tsha! When did— Tsha! tsha!'

'I only arrived— Tsha! tsha! Confound it! Caught cold, I suppose, and'—

'And have given it to me!'—with another sneeze.

A lady close by now began sneezing; and soon the infection spread, and there was tsha-tshaing all round. Such struggles to get at pockets and extract handkerchiefs among the closely packed company, ladies encumbered with their trains and fans and bouquets, not a hand available; and men handicapped with cocked-hats and swords, the latter giving civilian wearers, unaccustomed to their management, quite enough to do to prevent their tripping themselves up, sticking into their neighbours' legs, or getting foul of ladies' trains. It was the drollest scene imaginable, this sneezing chorus, and quite unaccountable; until G——, on his return home, discovered that his housekeeper—who like John Gilpin's wife was a 'careful soul'—had, when laying aside his court-suit, plentifully besprinkled it with pepper, to keep off moths. A good deal of this had remained in the cloth and about the creases and pockets even after brushing, and the heat of the crowded vice-regal rooms had

brought out its pungency, and set every one within reach of it sneezing.

G—— belonged to a family whose thoroughly Hibernian love of a joke was irrepressible. One of them meeting an old acquaintance he had not seen for many years, found the latter full of inquiries.

'And how are all your children?' he said. 'Tell me about them.'

'Children! I have none.'

'Oh, beg pardon, my poor fellow! I'm so sorry! I ought not to have asked. You had such a fine flock!'

'And they're that still, folks say. Fine young men and women, every one. They grew up well.'

'And your brother?'

'My brother! He's long since gone the way of all flesh.'

'Ah, poor H——! the merriest, jolliest, best fellow in the world! Dear, dear, what a pity!'

'So his bachelor friends all say; but really I don't think he's worse off than any other man who's gone and been and committed matrimony. You'll find him much the same as ever.'

'And you too, old fellow, I find much the same as of old,' rejoined the amused friend—'always fond of your joke!'

A QUESTION.

My home is in the North; piercing and bitter

The winds that sweep o'er the cold Northern sky.

From morn till eve I hear no song-birds' twitter,

Only the sea-gull's harsh discordant cry.

To the black rocks pale sea-weed tufts are clinging—

The only flowers that here can find a root—

And foaming waves, their white spray wildly flinging,

Warn travellers here they may not stay their foot.

But in a Southern home my Love is dwelling;

Rich Southern blossoms spring beneath her feet;

Bright birds with radiant wings, her praises tell us,

Circle and hover round her presence sweet.

Before her lies the sunlit summer ocean,

Whose blue waves scarcely seem to ebb or flow

The livelong summer day—while without motion

The bluer sky above; and soft winds blow.

Which would be truest love? Shall I, who love her

As mine own soul, invade her calm retreat,

And cry to her by the blue heaven above her:

'Be mine, or I must die! Come with me, Sweet;

The wind blow bitter, but they will not harm thee,

Clasped in my arms, and to my warm heart pressed;

The waves rise fiercely, yet they will but charm thee,

For thou wilt view them sheltered on my breast.'

Or shall I leave her in her Southern dwelling

Unknowing or unwitting of my love,

And master my wild heart and curb its swelling,

Whilst she walks sheltered in her orange grove?

Would it be love to bear her from its cover,

Upon my barren rocks to fade and pine?

Yes, if she loved me!—half but as I love her!

Aid me, kind Heaven! Say which course shall be mine?

FICTION IN TWO ASPECTS.

For the same reason that cards are tabooed in some houses, stern disciplinarians unhesitatingly prohibit all who are under their control from reading novels. Novels, in their minds, are always associated with impure and dangerous literature; just as cards are regarded by people of narrow views as mischievous inventions which are certain to demoralise those who use them. Even Goldsmith, himself a novelist, was prejudiced against this class of literature, for he writes thus: 'Above all, never let your son touch a novel or a romance. . . . Novels teach the youthful mind to sigh after beauty and happiness that never existed, to despise the little good that Fortune has mixed in our cup by expecting more than she ever gave.' Many have followed Goldsmith's counsel, and instead of discriminating between novels of a healthy moral tone and those of an opposite tendency, have condemned all alike.

Let the objections be what they may, it is nevertheless certain that novels of the better class have their uses, and can exercise a great influence for good on the minds of those who read them; hence to condemn them as not only useless but demoralising, is just as reasonable as to denounce all the theatres in our land as institutions for depraving the people. One of the first traits observable in a child is a love of hearing some story. A fairy tale or any narrative however simple, will thoroughly delight the wondering and curious minds of children. They like to sit and listen to any incidents which the narrator may invent or repeat about characters in real life, or characters 'carved out of the carver's brain.' This is a childish pleasure; but it is a pleasure which does not cease to please when childhood's days are over. The love of hearing a story remains; but with the developed mind comes, very naturally, a desire for more elaborate narratives, for faithful delineations of character, and for the word-pictures with which so many writers of fiction charm their readers.

This natural craving created the novel. The various histories of personal adventure, the biographies of those whose lives had been in any way remarkable, were by no means numerous enough to satisfy the demand for entertaining literature. Hence arose the need for supplying this demand; and in doing this there was no difficulty, since the demand could easily be met by fiction.

Human nature presents many curious phenomena, but none, perhaps, more curious than the interest and sympathy which can be felt by men and women for the imaginary creations of the novelist. Herein lies the power of the novel. Were it not for this interest and sympathy, the novel could have no *raison d'être*. Thus the novel does more than supply a demand; it draws its readers away from the consciousness of self, and arouses those feelings of sympathy which always have a humanising tendency. A good novel may exercise a beneficial influence, of which the reader is quite unconscious, but which will nevertheless bear fruit in its effect upon the character.

To look upon novels as mere inventions for giving idle people and frivolous young men and women an occupation, is to take not only a very low view, but a very unjust view of their utility. This view might be justified if they never rose beyond the standard aimed at by a certain class of French and English novelists; but writers with high aims have devoted their intellects to the production of novels which cannot fail to raise the moral tone of those who read them. An eminent Oxford lecturer recommends students for holy orders to read good novels as a means of enlarging their ideas, and educating themselves for the social work of the ministry. And quite lately, Canon Farrar, in a lecture delivered to the members of the Homiletical Society, gave his testimony to the value of novels when he said: 'The occasional reading of a good novel may be the very fruitful occupation of the brief leisure of the clergyman's study; may enable him far more successfully to touch the hearts and consciences of his hearers;

may furnish him with new thoughts and topics for many fresh and interesting sermons.'

Such passages as this must arrest attention, and who can tell what after-effect they may have on the minds of those whom they have once led to reflect? Many a profitable lesson has been learned and taken to heart from the pages of a novel. Faults have been recognised, and struggled against after the perusal of a work of fiction in which their pitifulness and the mischief wrought by them have been faithfully portrayed. Vicious inclinations have received their first check from the merciless exposure in some well-told tale, of the ghastly travesty upon pleasure and happiness that a life of sensual indulgence is. Take for instance the character of 'Becky Sharpe;' what a warning it must convey to the worldly woman who goes through life with no thoughts but thoughts of self and self-indulgence! In the vices, the faults, and follies described in these eloquent monitors, those who heed them may see their own shortcomings. Thus a good novel may be of incalculable use in warning its readers against some of their own failings; in pointing out those failings which no friend perhaps would have the courage to speak of, and in leading them generally to contemplate the defects in their characters.

But further than this, a good novel usually contains the delineation of a character worthy of imitation. And it very often happens that the study of a noble character, even if the character be that of a fictitious person, has a lasting influence on the mind. Thus a novel may act as an exemplar to its readers of the standard of life they ought to aim at. But it would, naturally, be impossible to estimate fully the value and influence of a really good work of fiction. A good novel that has made its mark in the literary world, and which remains popular after the interest in its first appearance has abated, is read by thousands. Out of these thousands there must be some who are capable of being influenced by it; and if the perusal does influence them for good, it is all the better for them and for society that the book was written.

There is another point for consideration. The most inveterate readers cannot always be engrossed in the study of works which require close attention. Times will come when the weary reader requires a change, and no more healthful change could be imagined than that afforded by the pages of a thoroughly interesting novel. Hence this species of literature has its value as a mental anodyne. And it has this value not only to the brain-workers, but to those whose lives are harassed by the dull monotony of daily cares and anxieties. It is a great relief to turn away from the realities of life, and become absorbed for a while in the imaginary cares, sorrows, and joys of the great world of fiction. The tension of the mind is relieved, new thoughts are suggested, fresh interests awakened, and the book is laid

down in a very different frame of mind from that in which it was taken up.

Collectively, novels are mischievous only to those who spend all their time in reading nothing else. Individually, they are harmful only when they have an immoral or irreligious tendency. And this leads us to the worse aspect of the subject. Unhappily, too many novels written now, not only by French but by English novelists, are nothing better than the embodiment of gross impurity, which makes an Englishman who has any feelings of decency blush for his countrymen, and especially for certain so-called lady novelists. For strange to say, the chief offenders are women! They are found ready to write things from which even the most unprincipled literary men would shrink, resulting in a 'stream of moral sewage' unblushingly given to the world. The mischief they do is incalculable. Such writers cannot possibly write truth. Their notions of life, of society, of human nature are false and mischievous. Their pathos, when they essay pathos, is soulless; while their love-scenes are coarse, and tainted with a sensuality which is as repellent as it is uncalled for. The sanctity of the holy estate of matrimony is unpardonably outraged by their writings. Heaven help the man whose bride has formed her ideas of the duties of a wife and mother from the novels of these literary pariahs! A girl's notion of a husband derived from such a source is that of an easy-going elderly man who will act the part of chaperon when he is wanted, keep up an expensive establishment for her, pay her bills, and then leave her to flirt with her chosen companions. Or in some cases the ideal husband is represented as an impossible Adonis, endowed with every bodily and sensual charm; while under any circumstances, the necessity for marrying for the sake of a grand establishment and a perpetual round of ball and opera going and other gaities, is strongly impressed upon the minds of those who only too willingly adopt the false and pernicious notions thus suggested. Some of the unhappy results of this polluting and dangerously fascinating literature are from time to time made only too patent in the columns of our newspapers. There can be no doubt in any thinking man's mind that this kind of fiction is largely instrumental in causing many of the miserable scandals which are now of such frequent occurrence. Novels of the class referred to are read by thousands of readers of both sexes; and as the majority of these readers are, alas! the young, with their unformed and easily influenced characters, it is utterly impossible that the most mischievous results should not ensue.

As soon as a book is known to be in any way improper, there is an unseemly rush to the libraries for its possession. The volumes are not allowed to rest for a single day on the shelf; but as soon as one reader returns them, some other eager applicant carries them off, probably to be pored over by all the novel-reading members of a family. This is deplorable. Time that might be spent in reading healthy fiction is thus frittered away,

and worse than wasted; for the perusal of this vitiated fiction only whets the morbid appetite, and gives it a keen relish for every kind of depravity.

YOUNG LORD PENRITH.

CHAPTER XLV.—A VISIT OF INSPECTION.

'YOUR accounts, Mr Ashton, are quite correct. Nothing could be, ahem! more accurate. And now—if you have the cash ready, we will not trouble you much more.'

The speaker was not Mr Dicker, as may easily be conjectured, but Mr Mould, the elder of the other two railway Directors who accompanied their Deputy Chairman on his visit of inspection. Mr Mould was a thick-set, elderly, pompous-mannered man, with white whiskers, fishy eyes, a bunch of great gold seals, drab gaiters, and a remarkable resemblance to the thick, short, little fish called a miller's thumb. His voice was harsh but indistinct, and he lisped slightly. Mr Mould was not popular. A warm man on 'Change, he was a cold man in private life, but, such as he was, he represented among the Directors an Opposition party, adverse to Mr Dicker. The other Director, whose name was Barber, and who was a little man, red-faced, and with stiff gray hair that rose, rebellious to the brush, echoed Mr Mould's sentiments, and belonged to the Opposition too.

There are two parties in every Association or Assembly, public or private, as surely as night follows day, and so it was in this Railway Company. Mr Dicker's wealth and energy made him all but supreme; but there were those who grudged him the fortune he had amassed and the power he wielded, and these two, Messrs Mould and Barber, were of the envious minority. They had listened coldly to their chief's eulogies of Hugh's courage and coolness at the time of the late accident, which had saved the Company thousands of pounds in the form of costs and damages. They had been mute when Mr Dicker spoke of preferment as a thing certain to accrue to the Hollow Oak station-master. It is for Managers and Chairmen to promote deserving subordinates, not for Directors as such. The station had been inspected; the accounts examined; it only remained to take over the money belonging to the Company.

Hugh went to his house, where the cash-box was kept, and returned to the waiting-room, where he had left the Directors, with a white scared face and haggard eyes. 'Gentlemen,' he said in a voice that he vainly tried to render firm, 'I have been robbed! The Company's money in my possession, as the accounts prove, amounted to one hundred and ninety-three pounds fifteen shillings. Of this sum, the greater part was in Bank of England notes, the numbers of which I have marked on this list, as you will see. The money, as I happen to know, was safe yesterday at noon. I absented myself for three hours or so, from the station, at this our slack time, leaving the cash in the cash-box, locked in a locked cupboard in my bedroom. I left the house-door locked, and found it locked on my return. So were the cupboard and the cash-box, when I went to seek the money a few minutes since. But—'

and here the young man groaned and turned away his face—'some thief has carried off every farthing there.'

The Directors looked at one another blankly. Then Mr Dicker rose, and going up to Hugh, clapped him on the shoulder in token of encouragement. 'This is a bad business,' he said; 'but do not take it so to heart, my young friend. No one imputes, for an instant, blame to you, and'—

'Excuse me, Mr Dicker, sir,' croaked out Mr Mould, arching his shaggy eyebrows and shaking his fat head: 'Mr Barber and I may not be quite certain to take so charitable, ahem! a view of what appears to us a very, ahem! awkward transaction.'

'Excessively awkward, very!' chimed in red-faced Mr Barber.

'Not, of course,' resumed the senior of the two, 'that we would absolutely condemn Mr Ashton unheard'—

'Condemn!' broke in Hugh, flushing crimson, and then growing pale again. 'Can you pretend to believe, gentlemen, that I—I'—

He ceased speaking, and stood with horror in his eyes, as if for the first time he fathomed the position in which he found himself, and the suspicions under which he lay.

'I, for one,' said Mr Dicker sturdily, 'believe, from the bottom of my heart, everything that Mr Ashton has told us. I would stake ten thousand pounds on his truth and honour, and ten thousand at the back of that, Mr Mould! I never saw a better lad, nor a braver, and I am not going to desert him at this pinch.'

But Mr Mould appeared to have reason on his side when he said, gruffly, that Mr Dicker's partiality must not blind him to obvious facts. Hugh was in a place of trust. He had been appointed, it seemed, without producing testimonials or giving security. The money in his charge had disappeared, on the eve of the Directors' visit, and he had nothing to say in explanation of the disappearance. With all due deference to the Deputy Chairman, the case had an ugly look. By all means let it be investigated. So the three Directors went, in Hugh's company, to look at the cupboard, and to look at the cash-box whence the money had been abstracted. The cash-box still contained some papers, vouchers for the sum amassed by Hugh as station-master, and Mr Dicker's letter. Then Hugh was questioned as to the reason of his recent absence from the station. He said, frankly, that he had spent some time in Bullbury, where an anonymous letter had invited him—for a purpose which he preferred to keep private—to attend.

'But where is this letter?' asked Mr Dicker.

Hugh could only conjecture that it had been stolen, together with the Company's cash, by the mysterious thief who had profited by his absence.

'Perhaps, Mr Dicker,' said Mr Mould, putting his thumbs into the armholes of his waistcoat, and looking more uncompromising than ever, 'you would like us to put faith in this cock-and-bull story?'

'That's just it—cock-and-bull story!' echoed Mr Barber, rubbing together his beefy little hands.

'I do believe it, Mr Mould, begging your pardon, and in spite of your ill-nature!' exclaimed the Deputy Chairman, taking Hugh's hand publicly, and rapping out an oath in conclusion, which we

will hope may be pardoned to the capitalist of Guildhall Chambers.

But Mr Mould, backed by his red-faced colleague, seemed master of the situation. He had, he said, in justice to the Company, a duty to discharge, disagreeable no doubt, but which no overbearing conduct on the part of his official superior should deter him from carrying out according to his conscience. The station-master at Hollow Oak, appointed, Mr Mould must say, in a loose and irregular fashion, to a place of trust, had failed in that trust. He had had, by his own admission, funds in his charge. What had become of those funds? That was the question. The plain duty of the Directors was to go before the nearest county magistrate—there was Sir Henry Marsden, Chairman of Quarter-sessions, a shareholder of their own, whose house, Marsden Hall, was near—and let justice take its course.

'I'll pay the money, and be hanged to it!' said Mr Dicker angrily. But the other two would not hear of this.

'Felonies,' said the senior dryly, 'must not be compounded, even to save your young friend, Mr Dicker.'

Hugh had quite broken down. The capitalist's kindness had unmanned him. But he dashed away the hot tears from his proud eyes, and said quietly: 'I am at your service, gentlemen. Let us go before'—

At that moment, with rattle and roar, and the ear-piercing shriek of the steam-whistle, the day-express went thundering past, drowning Hugh's voice; and, as the iron clangour ceased, a strange hubbub and dissonance disturbed the normal stillness of the place, and up the narrow stairs came, stumbling in their eagerness, several men. Will Farleigh it was who, flushed and panting, rushed up the first. Then followed police helmets, bright buttons, and blue uniforms. Two policemen led or dragged into the room a man in sailor's garb, with handcuffed wrists and dejected air, like a fox that has been trapped.

'Why, Will, lad? And Jackson—a prisoner, it seems!' cried Hugh, looking to right and left.

'Yes, Captain Hugh! we've got the villain, hard and fast! Here is the thief that robbed you,' said the bird-hunter eagerly. 'And here'—as one of the constables produced from his own pockets, and laid on the table, two bunches of skeleton keys, a chisel, a heap of gold and bank-notes, a letter bearing the Bullbury post-mark, and a bowie-knife of American make—'you may see what we found upon him. 'Twas Rose Trawl sent me. God granted that she should hear this hound, and a worse than he, Captain, one Swart or Grewler, the Miller of Pen Mawth, plotting your ruin, and how to send you out of your station here—those were the scoundrel's own words—with iron bracelets on; and he had nearly succeeded, but that I was on the watch, followed him to Bullbury, and got him arrested there.'

Even Mr Mould could no longer feel or affect incredulity. There were the bank-notes, found in Salem Jackson's pocket, and indorsed by Hugh. There was the anonymous letter that had tempted Hugh over to Bullbury, and which, as a measure of precaution, the robber had carried off. Every proof was clear, and Mr Dicker was jubilant.

'We will go before Sir Henry,' he said, with a look at Mr Mould, 'but with a different charge

to make, and against a different person, gentlemen.'

But the Bullbury sergeant of police, jealous for the honour of his town, intervened. The caption, he said, had been made in the borough. Sir Henry—at mention of whom he touched his helmet—was a county magistrate. Let the borough magistrates first decide whether the prisoner was to be handed over to the county jurisdiction or not. And let the prisoner be safely lodged in Bullbury Bridewell.

Salem Jackson simplified matters by his behaviour. Like most cowards, in adversity he was abject. He snivelled out contrite entreaties to be forgiven by all, and especially by Hugh, hinted darkly at his readiness to denounce the Black Miller, and only checked his garrulous confession by frequent pleas to be assured of immunity from punishment as, 'State evidence—Queen's—as I believe you call it in the—in the dear old country, gents!' So he was removed to strong lodgings at Bullbury; and Hugh wrung Will Farleigh's hands, and asked him a thousand questions, and thanked him as his best of friends; and Mr Dicker thanked him too; while even Mr Mould exclaimed stiffly: 'I am obliged to you, Mr—aw, Fairweather—for having prevented me from doing a great injustice.—Eh, Barber, didn't he?'

But he said it in a thick, pompous way, as though the fact of uttering those few words implied a receipt in full to himself and to his colleague for all previous severity in judging Hugh Ashton.

Then the two Directors caused their special train to be ordered up by telegraph from Stedham, and went off Londonwards, leaving the Deputy Chairman behind.

'I shall not leave my young friend here so soon, gentlemen both,' the capitalist had said with a cool nod.—'Good-day, Mr Mould—your servant, Mr Barber!'

Will Farleigh could not wait. A train, convenient for his return to the west, would start from Stedham at seven o'clock. And he must go to Alfringham, he said, to tell Miss Maud the result of his mission. Miss Maud, so the bird-hunter declared, had seemed as sorry for the scrape Captain Hugh was in, as himself or Rose Trawl. So Will trudged up again to Alfringham, where he found Miss Stanhope on the terrace that commanded a view of the road, eagerly awaiting him. And Maud thanked Will, and praised him, with thanks to heaven's mercy too, for Hugh's rescue from the vile schemes of vile men, and took him into the mansion, where Mrs Stanhope saw him, and commended him too, but with a well-bred moderation in her praise. And Will, with a grateful letter, hurriedly penned, of thanks from Maud Stanhope to her best of friends, dear Rose Trawl, was sent on in one of Lord Penrith's carriages to Stedham, in good time for his train to Cornwall. But he did not see the old lord himself, then struggling betwixt life and death.

CHAPTER XLVII.—MR DICKER'S DINNER.

Hugh Ashton left alone with Mr Dicker, after the special train had borne off the two other railway Directors, grasped the capitalist's hand and pressed it warmly.

'Heaven reward you, dear sir!' he said in a broken voice. 'You believed me, when others thought me a liar and a thief. I have known no such friend as you since my dear father died.'

'It is I, my boy, who have reason to be proud of your friendship,' answered Mr Dicker, coming for once fairly off his golden pedestal, and descending to the level of common humanity. 'I wish I had been your father. A son like you would have'— And the rich man sighed as he remembered that there was none to inherit his wealth save Miss Dicker—who was a plain little person, with pinkish eyes, and a resemblance to a white rabbit, overloaded with fine clothes and fine accomplishments—and whatsoever scion of needy nobility might become that young lady's husband.

'Your kindness emboldens me,' said Hugh, after a pause, 'to ask a further favour at your hands. My story—the real history of my life, I have breathed to no one; and I had determined, if I died before the proofs I seek were found, that the secret itself should die with me. But now, I begin to mistrust my own judgment, and should be glad of the counsel of so experienced a gentleman, as well as so true a friend'—

'As I am, eh?' chimed in the capitalist, patting Hugh gently on the shoulder. 'And quite right too. It's getting dark, isn't it; and if there's an inn in the neighbourhood where they can give us something to eat and a glass of wine, we'll dine together. By Jove! but we will.—Oh, the *Beville Arms*, eh?' And the capitalist passed his arm familiarly through Hugh's. 'Then the *Beville Arms* shall have the honour of providing for a hungry customer. This sort of thing makes me ravenous.—And you, Mr Edmunds, or whatever it is, will please to look to the station; and you and the others can drink Mr Ashton's health, at proper time and place, with this five-pound note.—Now come along, and I won't hear a word, mind, till dinner's on the table!'

The *Beville Arms*, gaining from the tattle of the porters some inkling of the wealth and commercial standing of its unexpected customer, exerted itself to content the fastidious palate of a Londoner. Somehow, there was a fish, and a chicken, and a pudding added to the chop and steak which were all that the local butcher could supply; while the landlord, who had been a servant at Alfringham once upon a time, unearthed a bottle of such green-sealed sherry as he kept for rare occasions, as when some belated fox-hunter slept at Hollow Oak.

'It's not half bad!' said Mr Dicker critically of the wine; 'but I'll give you, one of these days, some Amontillado, which couldn't be bought, sir, couldn't be bought. It was a present when the Aranjuez Junction was planned, from the Infante — Never mind that! I want to hear your story, my poor boy.'

'In the first place,' said Hugh, with a forced smile, 'I have to begin with a sort of confession, Mr Dicker. I fly, as we sailors say, false colours at the main. My real name is Hugh—but not Hugh Ashton.'

'Dear me!' returned the capitalist, really interested.

'It is from no mean motive, heaven knows!' went on Hugh, 'that I have consented to disguise my identity, and to bear the humble name by

which I have for years been known. My poor father—who died in helping to save lives in a boat-accident in Wales, last summer—was a man of rank and family, who lay for weary years under a foul and hideous charge—as false as it was cruel—that of fratricide—of the murder of Marmaduke Beville—his own brother.'

'Beville! your father! Surely he could not have been the Honourable George Beville, second son'—exclaimed the capitalist breathlessly.

'Second son, Mr Dicker,' said Hugh quietly, 'of the present Lord Penrith, of Alfringham, close to this place. I saw my grandfather, for the first time, when the railway accident occurred, the other day. Yes; my name is Hugh Beville—not Ashton—and these papers,' he added, as he drew from an inner breast-pocket of the coat he wore a large pocket-book of black leather, opened it, and laid it on the table before Mr Dicker—'these papers will prove that my words are true. Here is the marriage certificate of the Hon. George Beville's marriage to Letitia Ashton, at the chapel of the English Embassy in Paris. Here is my own certificate of birth and baptism, dated, as you will see, from Sydney, Australia. And here are letters'—

'But, my dear young friend!' said Mr Dicker, jumping excitedly to his feet, 'are you aware of two things? First, that you are heir to one of the oldest titles, and one of the greatest territorial fortunes, as well as the future head of one of our most ancient families in England. And, secondly, that you are the son of my kindest friend, of the man who lent me a helping hand at the most critical moment of my fortunes; for, without the two thousand pounds he lent me—and which, in fact, I owe still—I should never have been a partner in the house of Isaacson, Jellerby, and Dicker, of which I am now sole representative!'

Mr Dicker's excitement seemed contagious.

'Can it be possible,' exclaimed Hugh, springing up, 'that you have been my father's friend as well as mine? And if so, is it in your power to assist me in the task to which, beside his grave, I solemnly devoted myself, that of clearing his dear name from the base aspersions of a heartless world? Because, Mr Dicker, so long as George Beville is deemed the murderer of his brother, Hugh Beville chooses to remain as he has hitherto done, plain Hugh Ashton, and to earn his bread by the labour of his own hands. And no temptation of rank or fortune would avail to change a resolve deliberately made, and steadfastly adhered to. Even love itself could not do that.'

'You mean,' inquired the capitalist, who could scarcely credit himself with having heard aright, 'that you will not claim your rights as Lord Penrith's heir, unless he do justice to your father's memory?'

'That was the meaning I intended to convey,' answered the young man. 'Until my father's innocence is acknowledged, I, for my part, will not count kinship with those who drove him out, like Cain, into the wilderness.'

Mr Dicker resented himself, and eyed Hugh very much as he had eyed him, in Guildhall Chambers, at the time of his refusal of the cheque. 'Upon my word,' said the man of money, wonderingly, 'you are a very extraordinary young man. But I like you the better for it. I felt from the

first that you reminded me of some one, and now I look at you I see the likeness, and yet the difference. Your poor father had a thoughtful look and a retiring manner. Well, it so happens that I can, in my turn, hold out a helping hand to the son of my former benefactor. Sit down again, and fill your glass, and I will tell you how. I need not explain how first by accident—a lucky accident for me—I made acquaintance with Mr George Beville. I was then a poor and struggling man, and the money that he lent me—it had been part of his mother's fortune—gave me my first decided lift in the world, converting me from a clerk into a partner. I prospered so well, that in two years or so I should have been able to repay the debt, when suddenly came the rumour that Lord Penrith's eldest son had been shot dead, and that his brother had fled the country rather than stand his trial for the act. I never, for a moment, believed your father guilty.'

'You did not!' rejoined Hugh, with a bright gleam of pleasure on his face.

'No; because I knew him well, and could conceive,' resumed the capitalist, 'how his gentle nature would have shrunk, too sensitively perhaps, from the publicity of a trial in open court, and from the suspicious and callous curiosity of a crowd intent on being cheaply amused. And the circumstantial evidence, they said, was strong. Innocent men have been condemned ere this. At anyrate, I thought I could understand the motives that prompted him to keep away, and I tried more than once to discover his address and assure him of my regard; but in vain. What I never did comprehend was the reason of his doubly unfortunate absence at the very date of the murder.'

'These letters,' said Hugh, offering them, 'will explain that. They are from my mother, written while she was still Miss Ashton, and under a secret engagement to marry my father, who dared not, for fear of his father's prejudices and violence of temper, openly mention his attachment to an orphan girl without pedigree or fortune. It was a stolen match after all. My mother was induced to go over to Paris under escort of the old aunt with whom she lived, there to be privately married; and my father started to meet her in France, as ill-luck would have it, on the very afternoon that witnessed his brother's murder. He wrote to inform his father of this; but the old lord was angry and unjust, so that he destroyed the letter half-read, and answered it with a malediction.'

Mr Dicker took out his memorandum book and pencilled down a note or two. 'My poor friend left England, then, or at anyrate started from Alfringham, in the afternoon of the very day of the murder. That, in itself, should almost substantiate an alibi, coupled with the intention of going abroad, which these letters—yes, yes; post-marks and signatures well preserved, I see—establish.'

Hugh shook his head. 'My father always told me,' he said sadly, 'that he could not prove his innocence thus. He left his brother Marmaduke near the garden gate of the steward's house, and himself went by a footpath across the fields to Bromley Common, and so into the Stedham Road. At Stedham he procured a carriage and post-horses, and thus travelled to Southampton, whence he pursued his journey by railway to London and Dover. But he must still have been walking

towards Stedham when my uncle Marmaduke was found dead near Lambert's Stile, close to the Bullbury Road. Then, too, the pistol which was found in the snow, close to the place where the murder was done, had been mislaid, or stolen from the house, a day or two before; but unhappily my father had not mentioned its loss to any one.'

'That's bad!' rejoined the capitalist. 'But I hope we shall be able to prove that the fatal bullet was fired, not, as was assumed, from a pistol at all, but from a gun, and that the pistol was left on the ground for the purpose of directing suspicion to its owner, George Beville. Now listen to me! That poor fellow Purkiss, who perished in the shipwreck, as you remember, had special instructions from me to make inquiries, while in Australia, for George Beville's place of abode. In this he failed; but, strange to say, a man whom he befriended in Queensland, a poor wretch who had been waiter in a tavern, and was ill and poor, and whose last hours my clerk's good-nature rendered comfortable, dictated and signed a confession which Purkiss took down in writing, and which was among those valuable papers that were in the purple bag, and which you saved while rendering what assistance was possible on the night of the shipwreck. The man's name, as I recollect, was Cooper—it is a common name, I am told, among the gipsies, and he was himself of gipsy blood—and he had emigrated, been gold-digger, stockman, and shepherd, by turns, lost his health, and finally did not wish to die with the load of an undivulged secret on his conscience. Yes; his name was Cooper, and the usual camping-places of his tribe in or near this part of the Forest. He solemnly affirmed George Beville's absolute innocence of the crime imputed to him, declaring that he and a sister of his, Anne or Nan Cooper—better known as Gipsy or Ghost Nan—Why, you seem to know the name?' said the capitalist.

'I know the name, and the woman. But for heaven's sake, go on!' answered Hugh.

'Where was I?' said Mr Dicker. 'O yes; that he and a sister of his, bearing that name, were actually eye-witnesses of Marmaduke Beville's murder, being at that time encamped beside a hedge bordering the field in which the crime was committed, and that the deed was done by one James Grewler, the steward of Lord Penrith's estate, and a man in whom your grandfather reposed unbounded trust; and that the weapon used was a valuable gun, of somewhat remarkable construction for those days, which had been a present from Lord Penrith himself.'

'But why'—began Hugh, bewildered.

'Why, you will say,' went on the capitalist, 'did not the gipsies come forward to denounce the criminal, and save the reputation of an innocent man? But you must remember that these wanderers are at war with Society, and that it would take a strong motive to induce them to give evidence in a court of law, or aid the Justice they deem hostile to themselves. Then—if I recollect rightly—this Grewler had a hold on them, knowing of some poaching or petty depredations that the gang had committed; while, lastly, Cooper admitted having received hush-money, though to no great amount, from the steward, who afterwards, it appeared, absconded with a large sum of money belonging to Lord Penrith.'

'Why, then, may I ask, dear friend, did you'—Hugh began; but again the capitalist anticipated him.

'Why did I not, on receiving these papers from Australia which your courage preserved, make public the gipsy's statement, and clear your father's name? I answer—For two reasons. Cooper himself exacted a pledge from my clerk—of which, with some outline of the story, poor Purkiss informed me by mail—that old Lord Penrith should not hear the truth unless George Beville, or his innocent children, should prove to be alive to profit by it. I fancy the gipsy apprehended that some legal punishment might befall his sister, this Nan, or Nana, as he called her, of whom he seemed to stand in superstitious awe. And then, what proof had I that George Beville was alive! I knew that advertisements had been inserted, years ago, in the colonial newspapers, making inquiries about him, but fruitlessly. I will, however, telegraph forthwith to London to one of my people, and have the box that contains the confession brought to Hollow Oak to-morrow by the earliest train. Then we can go before Sir Henry, or any other justice of the peace, with a story worth the telling.'

The telegram was duly despatched; but there was still much to say and to arrange, and it was late before Hugh and Mr Dicker separated, the latter to commit himself to the lavender-scented sheets of the best bedroom at the village inn; the former to pass but broken slumbers, as may be guessed, while eagerly awaiting the morrow.

STAINED GLASS.

NEARLY contemporary with the revival of Gothic architecture applied both to ecclesiastical and secular buildings, the taste for the enrichment of such edifices by the introduction of coloured and painted glass has revived and flourished. The secret of communicating to glass the exquisite and glowing colours, so richly and harmoniously blended in the few uninjured specimens that remained in the medieval churches of Great Britain, if not absolutely lost, was for long buried in obscurity. Another most serious impediment was the difficulty of producing a pigment which should possess sufficient affinity with the glass to be readily incorporated with it, and yet be capable of reduction to a consistency favourable to its use as an ordinary kind of painting material to be laid on, and variously treated, according to the artistic necessities of the manipulator. But these and other minor obstacles gradually disappeared before the searching investigations of enthusiasts in an art that had been so long neglected.

Let us now follow the art of glass-staining through its chief stages. The design of the window being determined upon, and the cartoon or full-sized drawing being prepared, a kind of skeleton-drawing is made, shewing only the lines which indicate the shape of each separate piece of glass. It is apparently not generally understood that a window is not one piece of glass, to which are applied the various colours displayed, but a number of small pieces, which are united by grooved lead, which incloses each individual fragment, and that each different colour we see is the colour of that particular piece of glass, the only painting material

employed being the dark-brown pigment used to define the more delicate and minute details. This skeleton or working drawing then passes to the cutting-room, where sheets of glass of every imaginable shade are arranged in racks, each bearing a number, by which a particular tint is known. The drawing being numbered on each separate piece of glass by means of a frame containing small pieces of every shade, and each numbered according to the rack containing the glass of that colour, the use of this frame renders unnecessary the tedious process of visiting each rack in search of the particular shade required; the glass is laid bit by bit on the drawing, and each piece is then cut to the required shape by means of a diamond.

After the glass is cut, it passes to the painter, who laying it over the drawing, traces upon it with his brush all the details of features, folds of drapery, foliage, &c., as designed by the artist. But as the action of the weather and the continually varying conditions of the atmosphere, would speedily remove every vestige of paint if left in this state, it is necessary to subject the painted glass to the action of heat by placing it for several hours in a kiln, under the influence of which the paint is fused into absolute affinity with the glass, and becomes actually incorporated with its substance. After this burning process, it only remains for the different pieces to be united with the grooved leaden framework which binds the whole together. The places where the leads join are then carefully soldered together, and nothing remains but to thoroughly work over the whole surface with a thick kind of cement, which fills up any interstices between the glass and lead, and renders the whole panel perfectly water-tight and weather-proof.

After having noted the various processes necessary to the completion of a window, let us proceed to the examination and comparison of the different styles and peculiarities which characterise the originals upon which most of our modern productions are founded. These styles or epochs correspond almost identically with those similarly adopted to distinguish the progress of architecture. The first is the Early English, commencing approximately towards the close of the twelfth and extending to the end of the thirteenth century. The windows of this period are characterised by extreme simplicity and even crudeness of design; but these defects as such, when carried to extremes, are counterbalanced by the great richness of general effect, and an apparently intuitive appreciation of the rules which affect and govern a pleasing harmony of colour. As the architecture of this period in its severe simplicity had not arrived at the elaboration of dividing the windows into separate compartments, or 'lights' as they are technically termed, it is obvious that the artist was either restricted to the portrayal of a single figure or subject in one window; or was compelled, if desirous of introducing more than one such representation, to reduce the size of each individual picture, and by a judicious and ornamental arrangement of geometrically shaped panels, to form by the repetition of these an effective and pleasing whole. This treatment was one widely adopted at this time both in England and abroad; and the comparatively few specimens

at home, and those somewhat more numerous on the continent, are sufficient to shew how effectively these arrangements were carried out. A natural consequence of the then architectural ignorance of the advantages of mullioned windows, was the increase in size of the single lights, thus affording far wider scope to the artist in arranging his groups of subjects. They represented for the most part scenes from the life of Christ, or pictorial histories of sainted and martyred Christians; and evidenced painstaking care on the part of the monastic artists who originated and executed the designs.

On comparing the attempts at ornamentation of this period in architecture and in illuminated manuscripts, we find the medieval artists following in the same track; and thus we find the decorating of their windows to take the form either of canopies and bases, founded in their design on the actual stone models before them in their churches, or of foliated scroll-work of an extremely conventional and formal character. We find as a rule, that the single figures—such as figures representing the apotheoses of saints or martyrs—stood under the canopies referred to with probably nothing but a broad strip to support the figure; and in the same manner the architectural work of the canopies was designed with the most sublime disregard of perspective, and arches of the flimsiest structure supported a superincumbent weight calculated to strike a modern engineer with horror. But such eccentricities as these are forgotten when we look upon the complete work, and see how, with all its incongruities of drawing, and its frequent defiance of the laws of gravity, the idea thus crudely conveyed was one of reverential worship on the part of the designers.

On the other hand, the grouped subjects, when arranged to contain several scenes, were generally separated by flowing scroll-work bearing some resemblance to foliage, but growing in carefully drawn curves, and interlacing with a remarkably happy effect of colour rather than of truth to nature. Still, the effect as a whole is beautiful and devotional in the extreme; and it is interesting for those who have the opportunity of studying the progressive styles, to note how, as devoutness and purity of expression diminishes, there grows a taste for elaborate and beautiful ornamental details, and a more artistic aptitude in the drawing of human and other figures.

In the glass of this period the brush is but sparingly used; the dresses being very simple and with few folds, are little more than the coloured glass cut to the shape as nearly as possible, a few strong strokes of the brush indicating the leading folds. The figures too are small compared with the space at command, and the accessories of background, trees, buildings, &c. are treated in the simplest and most primitive manner. But by slow degrees the style became merged into what is known as the Decorated or Second Pointed Period.

This epoch appears in medieval art to be the culminating point in architecture, stained glass, and illumination, beyond which the most aspiring ambition could not hope to pass; and truly it is difficult to imagine anything more perfect in its own sphere than the different branches of art at this time. The crudeness and imperfections of the earlier years were now rectified and supplied;

while little was lost of original simplicity or feeling in the superior treatment of the later style.

In this the Decorated Period we find the windows divided by mullions, and as the years went on, the mullions by interlacing curves, forming smaller openings in the upper part of the window, called tracery. The width of the several lights by this alteration was naturally considerably diminished, and encouraged the almost universal adoption of the canopy as an appropriate finish to the work. And in these canopies are evinced the most pleasing and varied fancies, being, with certain restrictions, almost reproductions of the beautiful stone tabernacle-work still to be seen throughout the cathedral towns of England. The crocketed pinnacle, the traceried window, the gargoyle grotesquely leering from his coign of vantage—all are to be found depicted in transparent splendour. The painting too at this period is found to have progressed; the features are more carefully and naturally traced; there is less grotesqueness of pose; the drapery bears evidence of closer study; and the whole shews a decided advance towards artistic success. The glass itself is cut in larger pieces as the power of expression by painting increases, and this of course implies a more sparing use of the lead-grooves, and a corresponding increase of lightness. At this point then, it may be said the art has reached its zenith; and from this point commences the downward course. It is perhaps natural that as the artists towards the close of the fourteenth century became conscious of their improvement in many ways, each generation should strive to outstrip the other; and beneficial as such a course, under certain restrictions, must necessarily be, the unrestrained and imperfectly educated efforts of these rivals, brought about a result far more disastrous than an absolute standstill. These artists overlooked the fact that, from the very conditions of its manufacture and treatment, stained glass must always be to a certain extent conventional. This was the trap into which fell the leaders of the third period, called the Perpendicular or Third Pointed. In their endeavours, honest and laudable enough no doubt, to out-trip all competitors, they discarded the brilliant and gorgeous colours of previous years, and presented little positive colour, except in the backgrounds to figures or subjects. They substituted for the magnificent canopies of the Decorated Period, elaborate and generally painfully top-heavy structures, certainly more true in insignificant details than their predecessors, but in disregard of the commonest rules of perspective.

We have now arrived at the virtual termination of the practice of the art for the time being; for although it was carried on for some time longer on the continent, it languished slowly but surely, and expired for want of encouragement in the stagnant times of the seventeenth and eighteenth centuries; to be revived and to flourish again with renewed vigour, and under more favourable circumstances, in the present century.

Of the adaptability of this beautiful art to the internal decoration of both public and private buildings, it is not necessary to say much. It agreeably completes the general scheme of mural decoration, which would otherwise be wanting in unity of design, in consequence of the break in

the continuity of ornament by the existence of an undecorated and, apart from its purpose, unjustifiable blank space. Thus the artist in stained glass comes to the rescue of the decorator, and without interfering with the transmission of light, renders the hitherto unsightly window an additional beauty and adornment to the building. And the art has another great advantage—of being capable of use in concealment as well as display. It frequently happens that from various causes the outlook from a window is far from agreeable, though the necessity remains for the window itself; and here again stained glass is of the greatest service, as it can be arranged to admit light, and at the same time prevent the eye from resting on an unpleasant prospect without, or the curious eyes of prying outsiders from intruding on the privacy of those within.

It will be seen from the foregoing how many and urgent are the claims of the art of stained glass on the notice of lovers of architectural adornment; and in these days of intellectual enlightenment, and artistic as well as scientific progress, such claims will not present themselves in vain.

ANECDOTES OF DOCTORS.

AMONGST the most honoured of all the professions is that of Medicine. It is often also a very lucrative one, especially if a medical man gains a name in the *beau monde*, and still better, is called upon to attend royalty. It is said that William III. during the first eleven years of his reign paid the celebrated Dr Radcliffe on an average not less than six hundred guineas per annum.

At a more recent date, royalty has not shewn itself ungrateful for medical services. Mr Wadd states in his *Memorabilia* that the physicians who attended Queen Caroline had each five hundred guineas, and the surgeons three hundred; and that Dr Willis was rewarded for his successful attendance on King George III. by fifteen hundred per annum for twenty years, and six hundred and fifty per annum to his son for life. The other physicians had, however, only thirty guineas each visit to Windsor, and ten guineas each visit to Kew. A physician's ordinary fee at the close of the sixteenth and the beginning of the seventeenth centuries was ten shillings; but if it happened that his patient were a man of condition, the doctor expected gold; and still later, several pieces of that coin from rich patients. A good story is told of Sir Richard Jebb, who was once paid three guineas by a nobleman from whom he had a right to expect five. The doctor dropped the coins on the carpet, when a servant picked them up and restored them. But Sir Richard, instead of walking off, continued his search on the carpet.

'Are all the guineas found?' asked his lordship, looking round.

'There must be two still on the floor,' was Sir Richard's answer, 'for I have only three.'

The hint of course was taken, and the right sum made up.

Another physician who had been accustomed to receive a three-guinea fee from an old lady-patient, received one day only two, and had recourse to one part of Sir Richard's artifice, and assuming that the third guinea had been dropped, through

his carelessness, looked about on the floor for it. The result, however, was rather disappointing.

'Nay, nay,' said the old lady with a smile; 'you are not in fault. It is I who dropped it.'

How much of 'hope deferred' is experienced by many doctors in the beginning of their career before the guineas become plentiful, is little known by the public. It is said that the great surgeon Sir Astley Cooper, whose income eventually varied from fifteen to over twenty thousand per annum, earned five guineas the first year, and in his fifth his fees only reached a hundred pounds. But the day came when patients waited for hours in his anterooms before they could obtain an interview with him, and even then perhaps were compelled to go away without a consultation. And for some years one patient alone paid him six hundred pounds annually for professional attendance upon him at his seat near Croydon.

Though there are numerous instances of large sums being received by doctors for successful treatment of their patients, it is rarely that they reap substantial benefit beyond their ordinary fees, in cases of failure; instances, however, are known.

A story is told of a French lady who put herself into the hands of a surgeon to be bled; the operator used his lancet so clumsily that instead of a vein he cut an artery. This mishap eventually caused the death of the lady. With a mixture of humanity and irony, she made a will in which she bequeathed a life-annuity of eight hundred livres to the surgeon on condition 'that he never again bled anybody as long as he lived.'

A Polish Princess about a hundred years ago, who lost her life in similar circumstances, had the following clause inserted in her will: 'Convinced of the injury that my unfortunate accident will occasion to the unhappy surgeon who is the cause of my death, I bequeath to him a life-annuity of two hundred ducats, secured by my estate, and forgive his mistake from my heart. I wish this may indemnify him for the discredit which my sorrowful catastrophe will bring upon him.'

Bleeding in those days, notwithstanding its risks, seems to have been regarded as almost a sovereign remedy for present ills, and an antidote against prospective ones. A good story is told of Lord Chesterfield and a friend of his, Lord Radnor, who was fond of acting the surgeon as far as bleeding was concerned. We will give it in Mr Jeaffreson's own words, from whose interesting *Book about Doctors* we have obtained a portion of our information. 'Lord Chesterfield wanting an additional vote for a coming division in the House of Peers, called on Lord Radnor, and after a little introductory conversation, complained of a distressing headache.

"You ought to lose blood then," said Lord Radnor.

"Gad! do you indeed think so? Then my dear lord, do add to the service of your advice by performing the operation; I know you are a most skilful surgeon."

'Delighted at the compliment, Lord Radnor in a trice pulled out his lancet-case and opened a vein in his friend's arm.

"By-the-by," asked the patient, as his arm was being adroitly bound up, "do you go down to the House to-day?"

"I had not intended going," answered the noble operator, "not being sufficiently informed on the

question which is to be debated. But you, who have considered it, which side will you vote on?"

'In reply, Lord Chesterfield unfolded his view of the case; and Lord Radnor was so delighted with the reasoning of the man who held his surgical powers in such high estimation, that he forthwith promised to support the wily Earl's side in the division.

"I have shed my blood for the good of my country," said Lord Chesterfield that evening to a party of friends.'

Amongst the doctors who have lived in this century, Abernethy perhaps figures most conspicuously. Though many of the stories related of his brusque manners and sometimes rude speech are said to be false or exaggerated, sufficient are authenticated to leave no doubt of his eccentricity. He had, however, under a rough exterior a kind heart. He often refused or returned his fees if he discovered that his patients were poor. In one well-known instance, a widow lady, whose child had been under his care, received from him, inclosed in a friendly letter, all the fees he had taken from her under the impression that she was well able to pay—he had learned that her means were straitened—and in addition fifty pounds, which he begged her to spend in giving her child a daily ride in the fresh air. To the honour of the profession be it said that instances of kind consideration and true generosity are far from rare amongst our medical men.

It is difficult to imagine how Abernethy could act with so much kindness and delicacy of feeling towards one lady, and yet give such offence to another, that she exclaimed: 'I have heard of your rudeness before I came, sir, but I was not prepared for such treatment.—What am I to do with this?' she added; meaning the prescription he had given her.

'Anything you like,' the surgeon roughly answered; 'put it on the fire, if you please.'

He had met his match. The lady took him at his word, placed his fee on the table, and his prescription on the fire, then with a bow left him. Abernethy instantly followed into the hall, apologised, and begged her either to take the fee back or allow him to rewrite the prescription; but all to no purpose; the lady would not yield.

On another occasion the doctor was forced to own that he had the worst of it. The story runs thus. He was sent for one day in great haste by an innkeeper, whose wife had in a quarrel scratched his face with her nails to such an extent that the poor man was bleeding and much disfigured. Abernethy thought this an opportunity not to be lost for admonishing the offender, and said: 'Madam, are you not ashamed of yourself to treat your husband thus—the husband who is the head of all—your head, in fact?'

'Well, doctor,' fiercely returned the virago, 'and may I not scratch my own head?'

A gentleman once asked Abernethy if he thought the moderate use of snuff would 'injure the brain.'

'No sir,' was the doctor's prompt reply; 'for no man with a single ounce of brains would ever think of taking snuff.'

At the end of last century, and extending far into this, there flourished in Lancashire a family of the name of Taylor, the male members of

which for two or three generations were known as 'The Whitworth Doctors.' Indeed some of their descendants may possibly be still in the profession. Though plain of speech and possessing little refinement, the Whitworth Doctors were great provincial celebrities, especially as surgeons; but their fame extended far beyond their own region. In a number of *Tait's Magazine* published forty years ago, William Howitt gave an account of a visit he paid to the Whitworth doctor then extant, who related to him one or two amusing incidents connected with his father's attendance upon royalty. He had been called in to prescribe for the Princess Elizabeth, a daughter of George III. 'The complaint of the Princess was a continued pain and stupor in the head. Of course John Taylor immediately ordered her to take his snuff. This snuff is made of the powdered leaves of the Asarabacca, which has the property of purging the head, and of which plenty was grown in the garden at Whitworth. John having given his order and delivered the snuff, looked about him, and seeing the Princesses all there, he clapped the Queen familiarly on the back, and said: "Well, thou art a farrently woman [good-looking] to be the mother of such a set of straight-backed lasses."

'Queen Charlotte took the unusual familiarity with very good grace, smiling and replying: "Yes, Mr Taylor; and I was once as straight-backed a lass as any of them."

'The doctor had not retired from the presence of royalty very long, when he was sent for again in great haste.

"Well, and what is the matter now?" asked he on entering.

"Oh, the Princess is taken with such a continual sneezing that we are quite alarmed."

"Is that all?" said John. "Then let the girl sneeze; that is the very thing that will do her good."

'The doctor is said to have had the honour of completely relieving the Princess of her complaint.'

Patients doubtless often amuse by their idiosyncrasies the medical men they consult. According to Dean Ramsay, Dr Gregory—of immortal Mixture memory—used to tell a story of an old Highland chieftain, intended to shew how such Celtic potentates were once held to be superior to all the usual considerations which affect ordinary mortals. The doctor, after due examination, had in his usual decided and blunt manner pronounced the liver of the Highlander to be at fault, and to be the cause of his ill-health. His patient, who could not but consider this as taking a great liberty with a Highland chieftain, roared out: "And what business is it of yours whether I have a liver or not?"

We are also indebted to the Dean's *Reminiscences* for the two following stories. 'An old lady about seventy years of age sent for her medical attendant to consult him about a sore throat, which had troubled her for some days. The doctor, decked out with the now-prevailing fashion, a moustache and flowing beard, was ushered into her room. The old lady, after exchanging the usual civilities, described her complaint to the worthy son of Æsculapius.

"Well," said he, "do you know, Mrs Macfarlane, I used to be much troubled with the very same kind of sore throat; but ever since I allowed my

moustache and beard to grow, I have never been troubled with it?"

"Aweel, aweel," said the old lady dryly, "that may be the case; but ye maun prescribe some other method for me to get quit o' the sair throat; for ye ken, doctor, I canna adopt *that* cure."

'A servant of an old maiden lady, a patient of Dr Poole, formerly of Edinburgh, was under orders to go to the doctor every morning to report the state of her health, how she had slept, &c., with strict injunctions *always* to prefix, "with her compliments." At length one morning the girl brought this extraordinary message: "Miss S—'s compliments, and she died last night at eight o'clock!"'

Doctors are by no means infallible, and sometimes make very serious mistakes. In the *Book of Blunders* there is a curious story told, quoted from Cooke's *Seven Narcotics*, of a young Spanish doctor who went from Madrid to the Philippine Islands some years since with the design of settling in the colony, and pushing his fortune by means of his profession. On the morning after he landed, the doctor sallied forth for a walk on the *paseo*. He had not proceeded far when his attention was attracted to a young girl, a native, who was walking a few paces ahead of him. He observed that every now and then the girl stooped her head towards the pavement, which was straightway spotted with blood. Alarmed on the girl's account, the doctor walked rapidly after her, observing that she still continued to expectorate blood at intervals as she went. Before he could overtake her, the girl had reached her home, a humble cottage in the suburbs, into which she entered. The doctor followed close upon her heels, and summoning her father and mother, directed them to send immediately for the priest, as their daughter had not many hours to live. The distracted parents having learned the profession of their visitor, immediately acceded to his request. The child was put to bed in extreme affright, having been told what was about to befall her. The nearest *padre* was brought, and everything was arranged to smooth the journey of her soul through the passes of purgatory. The doctor tried his skill to the utmost, but in vain. In less than twenty-four hours the girl was dead. As up to that time the young Indian had always enjoyed excellent health, the doctor's prognostication was regarded as an evidence of great and mysterious skill. The fame of it soon spread through Manilla, and very soon the newly arrived physician was beleaguered with patients, and in a fair way of accumulating a fortune.

In the midst of all this, somebody one day had the curiosity to ask the doctor how he could possibly have predicted the death of the girl, seeing that she had been in perfect health a few hours before.

'Predict it!' replied the doctor; 'why sir, I saw her spit blood enough to have killed her half-a-dozen times.'

'Blood! But how did you know it was blood?'

'How! What else could it be?'

'But every one spits red in Manilla.'

The doctor, who had in the meantime observed this fact, and was labouring under some uneasiness in regard to it, refused to make any further confession at the time; but he had said enough

to elucidate the mystery. The thing soon spread through the city, and it became clear to every one that what the new *medico* had taken for blood was nothing else than the red juice of the *bufo*, and that the poor girl had died from the fear of death caused by his prediction.

The doctor's patients now fled from him as speedily as they had congregated; and to avoid the ridicule that awaited him, as well as the indignation of the friends of the deceased girl, the doctor was fain to escape from Manilla, and return with all speed to Spain.

We will bring our gossip to an end with a story illustrating the varying degrees of feeling, regulated by the state of his health, with which a patient may be said to regard his medical adviser. It is related of Bouvart, a French physician, that one morning as he entered the chamber of a certain Marquis whom he had attended through a very dangerous illness, he was addressed by his noble patient thus: 'Good-day to you, Mr Bouvart! I feel quite in spirits, and think my fever has left me.'

'I am sure it has,' replied Bouvart dryly. 'The very first expression you used convinced me of it.'

'Pray explain yourself,' said the Marquis.

'Nothing is easier,' was the doctor's reply. 'In the first days of your illness, when your life was in danger, I was your "dearest friend;" as you began to get better, I was your "good Bouvart;" and now I am "Mr Bouvart." Depend upon it you are quite recovered.'

A COURIER'S STORY.

My name is Carl Johann Roeckel. By birth and nationality I am a Swiss, but cosmopolitan in every taste and habit. In my early days I regularly followed the profession of a courier, as I do now occasionally when any of my old patrons or their friends require such services, which is rather infrequent, the taste of the travelling public having degenerated into hasty journeys by express trains, with the consequent loss of all enjoyment of the different phases of scenery through which the travellers are passing. In the course of my many years' experience, I have been witness to many strange occurrences, have assisted in many a secret and adventurous undertaking, and have been subject to many perils. From among such varied experiences I give the following strange story, suppressing for obvious reasons the real names of those interested.

Many years ago I was engaged as courier to His Excellency the Honourable Frederick Eslington, ambassador-extraordinary of His Britannic Majesty King George, on a special secret mission to one of the great continental powers. Having finished his duties and successfully attained the object of his mission, we started on our homeward journey in the summer of 18—. The period was one to be long remembered from the political excitement which existed throughout all Europe, almost every government having unsheathed the sword. We had travelled a considerable part of the first stage of our return journey, when His Excellency, who

was feeling the fatigues of the incessant travelling in the heavy rumbling carriage, said he should stop at the next town we arrived at, and take rest and refreshment; both of which he was much in need of, besides having important state documents to transcribe. In due course we arrived at the small town of S—, on the confines of Germany, where we put up. We stayed a day and a half there; and I was then instructed to have the carriage and horses in readiness to continue our journey. His Excellency meanwhile had completed his writings, to which he had assiduously applied himself; and told me, as it was a fine afternoon, he would take a short walk, and on his return resume his journey at once; and I must therefore make all necessary preparations. He accordingly left the hotel. But he was never seen afterwards, nor was anything known of his fate!

I waited for upwards of an hour anxiously, and then made a close search for him, which I continued for several days; but not a trace could I discover of my master. A villager, however, living outside the town brought to me at the hotel a pair of overalls, which he stated he had found in a neighbouring copse. I recognised the garment as belonging to His Excellency; and at once repaired with the villager to the copse, and closely examined the spot, but found no trace or sign of any struggle.

Finding it useless to prosecute the search, I at once returned to London with His Excellency's travelling gear, which I handed to his family. The British government at once instituted inquiries, as also did His Excellency's family, and large rewards were offered by both, and advertisements widely disseminated for any information respecting the missing ambassador; but they failed one and all to gain any information of or the slightest clue to his fate. A certain amount of suspicion attached to me, but it was only momentary, and I at once cleared myself of it, and assisted the distracted wife and her missing husband's family as much as lay in my power. Well I remember the agonies of anxiety and suspense caused to the ambassador's wife and family by the distressing calamity. Magisterial investigation was made, experts were employed, and every endeavour made to penetrate the dark veil of mystery surrounding the event; but all efforts were unsuccessful. One of His Majesty's ambassadors had completely and mysteriously disappeared, without leaving a clue to light up the awful obscurity which enveloped the tragic occurrence.

Several years had elapsed since the distressing event, and the memory, the painful memory, of it was beginning to fade from my mind, when I happened to be in Antwerp on a short tour through Belgium with patrons. And while listlessly strolling by myself on the quay one summer's evening, watching the passengers disembarking from the newly arrived steamer, I was accosted by a mean, haggard-looking, little man of beggarly appearance, who spoke to me in Flemish.

'Are you not Herr Roeckel the courier?' said he.

'Yes,' replied I. 'What do you want with me? Who are you?'

'I suppose you have quite forgotten me?' said he.

I stared at him keenly. The man's features were somewhat familiar to me, yet I was confused in my remembrance of how and where I had seen him. 'I do not know you,' said I.

'Yes; you do, and very well,' replied he. 'My name is Ludwig Kuhl, and I have frequently driven you the first stage out of Vienna. I did so when you were courier to His Excellency the Honourable Eslington, in the summer of the year 18—.'

(The courier is remembered even when the patron is forgotten, for it is to us that landlords and their servants look for their gratuities.)

I stared at him, and then recognised the haggard looks. 'True,' said I; 'I remember you now well. How goes it with you? What do you here in Antwerp? The old trade, eh?'

'Ah, no!' he replied with a deeply drawn sigh. 'It's a long story, and I can't tell it to you here in all this noise and bustle. Let us go to a quiet cabaret.'

I agreed; and in our short walk I revolved in my mind all those circumstances, so dark and impenetrable in their profound mystery, which had happened years before. And I remembered how our postillion Ludwig Kuhl had assisted me in the unavailing search for His Excellency. Soon we reached a little *cabaret*—their name is legion in Antwerp—in one of the back streets near the Cathedral; and with a glass of his favourite Boonjekamp in front of him, he seated himself, and told me the following sequel to the mysterious disappearance.

'You must remember me, friend,' he began, 'when I was in a better condition than you now see me;' and he scanned his wretched garments, shrugging his shoulders with an impatient air.

I nodded acquiescence.

'Well,' said he, 'you must also know in your long experience of travel that all classes of society on the continent, and particularly in Vienna, have their secret club. The postillions had theirs; but it was subject to the rule of the Chief Secret Society. In my younger days, friend, I was induced, in an unlucky moment, to enroll myself as a member, and take the oaths of the Secret Society of Postillions. Bitterly have I repented since, for it is to that circumstance I owe my present deplorable state of mind and position.'

'But what has that to do with the mysterious case of His Excellency?' I asked of him somewhat impatiently.

'Much more than you imagine or can ever know, friend,' replied he, sententiously wagging his head. He paused for a moment. 'Well, I will tell you,' continued he, 'though you must not break my story with your inquiring comments. Firstly, then, you must know that I was on the establishment of Herr Spültzen, the carriage-master and stable-keeper from whom His Excellency the Honourable Eslington hired his travelling carriage and horses for his return journey. It was known to the Chief Secret Society that His Excellency was in possession of important papers, and it was also known that he was on the point of starting with them for England. The Chief Commander had important reasons for

obtaining these papers, or copies of them, and of one in particular above all others, by fair means or foul; and what the Chief says is to be done, is done invariably at any cost. The Committee had balloted for the person who must execute their orders, and their choice had fallen on me as postillion, and the more likely to effect a successful result. By virtue of my oath I was bound to obey, or I should have suffered a secret death, by assassination probably. I need not tell you my instructions; but a dreadful fate awaited you in the event of you or His Excellency obstructing our wishes. In every town through which we passed there were emissaries of the Chief Society to assist me, so great is its organisation; and when I received your instructions to pull up at the next town, which if you remember was S—, I knew the wishes of the Chief Commander would be effectually carried out. The landlord of the hotel you stayed at and the head hostler were known to me as members of the Chief Society, and there were other residents in the town also members whom I did not know. So you see, my friend, how His Excellency and you were encompassed in a net from which there was no escape; and he clucked to himself as he said it. 'Now you remember how His Excellency was always engaged in writing his despatches and documents. Well, there was consequently great difficulty in getting a view of the papers without adopting foul means, and time was of great importance to the Chief Commander.'

'What!' I exclaimed in great astonishment, my hair almost on end with the suddenness of the confession—'what! Do you mean to tell me Carl Johann Roeckel, that you murdered His Excellency in cold blood?'

'Not exactly that, friend,' he quietly replied. 'When His Excellency went for that short walk, the head hostler also went for a stroll in the same direction. A short distance from the town the hostler met a friend, also a member, and they quickly bound and gagged His Excellency, and carried him to the cellar of the latter's house, where they kept him secretly until after the excitement of the disappearance and search had subsided, when he was taken to Vienna in the involuntary disguise of a dangerous lunatic peasant, and afterwards'—And he made a significant sign indicative of strangulation. 'The papers were abstracted by the landlord, and handed to me, and I in turn delivered them to the Chief Commander personally. Nothing was ever said about the missing documents, if you recollect, because only one other person besides His Excellency and the Chief Commander knew of them, and he dared not say what they were.'

'But how,' asked I, 'was everything kept so quietly, as the British government made a great stir over the matter, and large rewards were offered?'

'Well,' replied he; 'those to whom the matter was referred were mostly members of the Chief Society, which you must remember, numbered in its roll members of all ranks and stations. The pair of overalls found in the copse some days after the disappearance were purposely placed there to lead and encourage the belief that His Excellency had been robbed and then murdered.'

'But you do not account for your being here in Antwerp now,' said I.

'Well, friend,' continued he, and he drew himself closer to me and spoke in a very low tone—'well, the Chief Commander, in consequence of the stir made by both the British and our government, and fearing disclosure on account of the large rewards offered, took effective steps to prevent it by ordering the deaths of those concerned in the tragedy. The landlord of the hotel, however, suddenly decamped to America—where he will be tracked, never fear—after hearing of the deaths of the hostler and his friend, who were found stabbed in their beds; and I escaped here, by circuitous routes, and I have remained in hiding ever since. But I am already known and discovered, and I go daily in fear of my life. The sign of the Black Dagger here'—and he tore open his vest and shirt, disclosing the print of a dagger on his breast—'is known to all members of the Secret Society. My death-warrant has long ago been signed, and I am studiously watched, I feel certain. Even now'—And he suddenly stopped, casting a cautious glance round the room, and pointed to a stranger who was silently smoking and drinking, to all appearance engrossed in their enjoyment. 'I must leave you,' he said in a hurried hoarse whisper. 'Good-bye, friend;' and he crept out of the *cabaret* quickly.

The next morning, Ludwig Kühl's body was found floating in the canal, near its entrance to the Scheldt, pierced in the breast by a short dagger, with the device in German on its flat black handle, 'We wait.'

LEANING AND CROOKED TOWERS AND STEEPLES.

Of these singular objects, whose striking appearance is due to various causes, we meet with a number of instances both in our own country and on the continent. Of leaning towers, perhaps the most remarkable, certainly the most widely known, is the celebrated one at Pisa in Italy. It is one hundred and eighty-seven feet in height, being ascended by three hundred and fifty-five steps, and is inclined from the perpendicular rather more than fourteen feet. Erected about 1174, this beautiful structure is built of marble and granite, having eight stories, each formed of arches supported by columns, the several stories being divided by ornamental cornices. Being unconnected with the neighbouring buildings, it was probably intended to be used as a belfry. Notwithstanding its inclination and the fact that seven hundred years have elapsed since the erection of the structure, it has withstood the ravages of time with more than ordinary success, exhibiting at the present time hardly any perceptible sign of decay. It would seem that the tower has not always presented the peculiar appearance which it has now assumed, for in the Campo Santa, a neighbouring burial-ground, the cloisters of which are ornamented with curious paintings on stucco, there exists a representation of the tower in an upright position. These paintings are supposed to have been executed about 1300, more than one hundred years after the tower was built; so that it may be considered pretty certain that the inclination was caused by the gradual sinking of the earth, as is the case with those at Bologna in the same country.* The taller of these latter, that of Asinelli, was built in 1109. It is over three hundred feet high, and has been stated to

incline two feet and a half. It may be ascended from the interior by five hundred steps; and the summit commands an extensive view of the neighbouring cities of Imola, Ferrara, and Modena. The lesser tower of the two, that of Garisendi or Garissnidi, compared by Dante to the stooping giant Antæus, is about one hundred and forty feet high, and deviates seven or eight feet from the perpendicular. It has been found by experiment that most lofty buildings of any antiquity are slightly inclined from an upright position. In Italy, besides those already mentioned, numerous other instances are to be found. The bell-tower of St Mary Zibenica at Venice leans; also towers at Ravenna, and between Ferrara and Venice.

The most remarkable leaning tower in Great Britain is that of Caerphilly Castle, Glamorganshire. Being but between seventy and eighty feet high, it is eleven feet out of the perpendicular. The castle of which the tower forms a part was built about 1221, and the canting of the tower is said to have been caused by an explosion of hot liquid metal used by the occupants of the castle to pour on the heads of their enemies, at a siege which took place in 1326. There are also leaning towers at Bridgenorth Castle in Shropshire and at Corfe Castle in Dorsetshire, both caused by the use of gunpowder during the Civil War between King Charles and his parliament.

Of churches with crooked spires, the most noteworthy is the famous one at Chesterfield, in Derbyshire. It leans six feet towards the south, and four feet four inches towards the west, and its height is two hundred and thirty feet. So peculiar is the distorted appearance of this steeple, that it is said to appear falling towards the spectator from whatever point he approaches it. There are several traditions extant respecting this singular architectural deformity. One is that the builder, a native of Chesterfield, having agreed to erect a church, did so, finishing the tower without adding a spire. The authorities of the town, not being satisfied with the structure, appealed to the Attorney-general; who gave his opinion that the spire was as much a part of the church as the tower, and that consequently the builder must finish his contract by its addition. The subject was, however, fully discussed at a meeting of the Institute of British Architects in January 1855, and it was ascertained that the oak planks on which the framework of the spire rests are much decayed on one side; which is sufficient to cause the divergence from the perpendicular. The timbers also have the appearance of having been used in a green and unseasoned condition. The action of the sun upon the spire would therefore cause it to become crooked, and this may account for the distortion, without attributing it to design.

There used to be another example of a crooked spire at the church of St Nicholas, Great Yarmouth, which served as a landmark from the sea. There is an excellent view of the town of Yarmouth, shewing St Nicholas with its crooked steeple in Buck's *Perspectiva Views*, vol. iii. plate 82 (London, 1774). It, like Chesterfield spire, from whatever way viewed, appeared awry. It was however, taken down and rebuilt perpendicular about the commencement of the present century. Salisbury Cathedral spire is said to lean considerably from an upright position. There was a

common tradition in Chichester some sixty or seventy years ago that the architect who built the cathedral having quarrelled with his foreman, the latter went to Salisbury and built the spire of the cathedral at that place, which he carried up more than four hundred feet, in order to outdo the work of his former master, which was only three hundred feet in height. There is however, no truth in the tradition, as Chichester Cathedral was completed early in the twelfth century, and Salisbury not until the thirteenth. Lowestoft steeple is crooked, which is attributed to the warping of the lead-covered timber of which it is constructed. In the Lincolnshire fens, Spalding Church spire used to lean so much that it was in great danger of tumbling down. Four miles from Spalding is Surfleet Church, whose steeple, on account of the marshy ground on which it is built, inclines in a frightful manner towards the west. So alarming is the appearance of this singular building, that travellers have frequently dismounted from their horses, afraid lest the steeple should fall on them. Another example is Weston Church, also in this neighbourhood. It too has for many years leaned very perceptibly to the west. On Sunday evening February 8, 1835, Linthwaite Church, near Huddersfield, was struck by lightning; and without any of the stones being shattered, the spire was bent out of the perpendicular so as to incline towards the church. The tower of the Temple Church, Bristol, leans nearly four feet from the upright, and has by sinking separated from the church. Its appearance is unpleasant and somewhat alarming; but it has been examined from time to time to test its security. The steeple of Glasgow Cathedral has an inclination towards the south-west, commencing at the highest battlement, perhaps thirty or forty feet from its top. It was struck by lightning in 1756.

As a last instance, we will give the case of Wybunbury Church, Cheshire, the tower of which used to lean about five feet towards the north-east. The inclination of this tower having exhibited a slight increase from year to year, it was resolved in 1834, so dangerous had it then become, to take it down and have it rebuilt. Fortunately, however, before this was commenced, a Mr Trubshaw having made an examination of the building, undertook to set it right again without pulling it down. By a simple and ingenious process, he accomplished his object; and the tower was restored to its perpendicular so safely that not a single stone of the fabric was injured; and it has ever since been perfectly secure and perfectly upright.

CHINESE PROVERBS.

How or whence a proverb has originated is in most cases a matter of doubt. Some few perhaps are choice morsels culled from the writings of noted authors; others are adaptations from the literature of ancient nations, and notably from that of the Hebrews; but in most cases they can be safely included under the heading 'old sayings.' This is the case with English proverbs; but it is more especially so with the twenty or twenty-five thousand which form the principal adornments of Chinese conversation. Mr Scarborough has devoted considerable time and trouble to making a methodical collection of the wise or witty say-

ings of the Celestials, and has produced a book (*Chinese Proverbs*, Trubner & Co., London), which will repay perusal, firstly, on account of the amusement which may be extracted from its pages; and secondly, because it serves to illustrate the morals, customs, and habits of those peculiar people.

Chinese proverbs are not without wit, although they do not always incline to brevity. In fact some of them may be fairly entitled 'short moral stories,' in which the Chinese excel; although, as the author of the work above referred to remarks, their conduct is not by any means in accordance with their preaching. Illustrative of their eagerness for obtaining a bargain, we quote the following generally accepted maxims: 'Calculate what you can sell before you buy.'

Who does not ready money clutch,
Of business talent has not much—

a distich worthy of the directors of a co-operative store. 'If you'd not be cheated, ask the price at three shops.' And again: 'When one cheats up to heaven in the price he asks, you come down to earth in the price you offer.' A slow trade is described by the phrase: 'To sell a couple of cucumbers in three days.' Whilst the good old maxim: 'There is no friendship in business,' is rendered by the Celestials in somewhat uncouth phraseology: 'Relations or no relations, my turnips are three hundred *cash* per *picul*.' The excellent results following from the united action of partners in business, are shewn by the couplet—

When two partners have one mind,
Clay is into gold refined.

Whilst very much disposed to sharp practice, the Chinaman is fully alive to the fact that if he would attain either eminence or competence, he must work hard. Invitations to perseverance and to thoroughness of purpose are frequent. 'If you don't scale the mountain, you cannot view the plain;' and, 'You had better go home and make a net than go down the river and *wish* for the fishes,' are illustrations of the Chinese method of expressing this sentiment.

The caution of the Chinese character is fairly represented by: 'If the wind be strong, yield to the wind; if the rain be heavy, get away from it;' and their dislike of procrastination after resolution, by the proverb: 'Wait till the Yellow River becomes clear, and how old will you be?' The fact being that the Yellow River is naturally and permanently 'of the muddiest muddy.'

Many of the Chinese proverbs have their counterparts in English; the difference of expression, however, being in many cases characteristic. Thus: 'Throw a sprat to catch a whale,' is rendered: 'Throw a brick to allure a gem.' 'Not to cry stinking fish,' is rendered in Chinese: 'The melon-seller declares his melons sweet.' 'Take care of the pence, and the pounds will take care of themselves,' becomes: 'Count *cash* as though they were gold'—*cash* being a coin of the smallest denomination. Again: 'A rolling stone gathers no moss,' is translated: 'The swallow plastering its nest is labour lost'—this being a very happy allusion to the migratory habits of that bird. 'Preparing is preventing,' an old English expression, has its counterpart in: 'Get

the coffin ready, and the man won't die;' whilst 'Too many cooks will spoil the broth,' is rendered by the curious expression: 'Seven hands and eight feet.' 'There is a black sheep in every flock,' becomes: 'Crows are black all the world over.' And the oft-quoted saying of 'Robbing Peter to pay Paul,' assumes the form: 'To pull down the western wall to repair the eastern.'

A great number of proverbs amongst the Chinese are noticeable chiefly for their peculiar forms of expression, or the singularity of the figurative language used. To lend to a spendthrift is: 'To pelt a dog with meat dumplings.' An impracticable task is described as: 'Kua Fu's race after the sun's shadow;' or in derision of its inutility, as: 'A blind man going up a mountain to view the scenery.'

Many allusions are made in Chinese proverbs to the decrees of Fate, and the bulk of the people are firm believers that 'Nothing follows man's calculations, but that his whole life is arranged by Fate.' The opposite belief, however, finds expression in the following curious sentence, which in sentiment is much more healthy: 'The more I study, the more I miss the mark—what have I to do with Fate? The more I miss the mark, the more I study—what has Fate to do with me?'—a peculiar arrangement of an antithetical sentence, and containing much food for thought. A man without the necessary information is 'A blind man on a blind horse coming at midnight to a deep ditch;' whilst the following is a little gem in the way of curious expression. Speaking of the scarcity of good men, the Chinese say: 'There are "two" good men; one of them is *dead*, the other *unborn*.' A man with an extreme absence of mind is said 'to seek the ass he is riding on;' or still more frequently, his bundle, his umbrella, and himself are represented as three individualities; and he is made to say: 'Here's my bundle—here's my umbrella—but where am I?' Umbrellas, by-the-bye, are important possessions among the Chinese, and the allusion to the same in the following curious verse will be readily appreciated; moreover, the moral conveyed is extremely good:

He hoards to-day; he hoards to-morrow; does
nothing else but hoard;
At length he has enough a new umbrella to afford;
When all at once he is assailed—a wind arises
quick,
And both his hands grasp nothing but a new
umbrella stick.

Servants seem almost as much trouble among the Celestials as among the English. A very independent domestic tells his master bluntly: 'There are temples elsewhere than on Mount Ni;' whilst on the other hand the employer gives vent to his spleen in the following curious, if not complimentary saying: 'One man will carry two buckets of water for his own use; two will carry one for their joint use; but three will carry none for anybody's use.' 'A lean dog shames his master,' is the reproof offered to a mean employer by his servant.

So far our attention has been given to those proverbs which illustrate the ordinary manners and habits of the great people that inhabit the eastern portion of Asia, and that without praising or condemning the sentiments expressed. No person can, however, fail to appreciate the beauty

of many of the moral sayings in use among the Chinese, and which they are in the habit of displaying in their places of amusement upon high-days and holidays, after the manner of the conductors of our Sunday-schools. They illustrate forcibly the high tone of morality taught by the old philosophers, as well as the insatiable desire for learning which exists even to the present day. We have not attempted any particular arrangement of subject, but conclude with the following :

'A wise man can fill a thousand mouths ; a fool cannot protect himself. One good word can warm three winter months ; one bad one stir up anger. If you converse by the way, remember there may be men in the grass. Let those who would not drink, look at a drunken man. The lion opens his mouth ; the elephant [the emblem of wisdom] shuts his : shut yours. They are only horses and cows in clothes who neglect the study of the past and present. Every character must be chewed to get its juice. Foam on the waves is the fame of earth. The bright moon is not round for long : the brilliant cloud is easily scattered. The ancients saw not the modern moon ; yet the modern moon shone on the ancients. The great wall of a myriad miles remains ; but Chin Shih 'Huang [its builder] is gone. Heaven, earth, and the spirits love the humble, not the proud ; to the humble they give happiness ; to the proud, calamity. Man cannot become perfect in a hundred years ; he can become corrupt in less than a day. Men who never violate their consciences are not startled by a knock at the door at midnight. Each half of a riven bamboo smokes. [This is said against quarrelling.] Better be upright and want, than wicked and have superabundance. To save one life is better than to build a seven-storied pagoda.' And lastly : 'Do not consider any virtue trivial, and so neglect it ; or any vice trivial, and so practise it.'

MARGINAL CREDITS.

IN the discussions that have lately taken place as regards banking, a phrase has sometimes been employed about which little or nothing is generally known. The phrase is 'Marginal Credits.' There is no reason why there should be any obscurity or mystification on the subject. The following is the meaning of the phrase.

By Marginal Credits are meant certain operations in which bankers lend the credit of their names, as it were, to their customers, and thus enable them to carry out important commercial transactions which otherwise could not be gone into, or only at excessive cost. A merchant in this country, for instance, desires to import tea or silk, but his name is not so well known on the Chinese Exchanges, that bills drawn upon him by a merchant in China can be sold there at a reasonable rate of exchange. The tea or silk cannot be bought without the money being on the spot to buy it with, and if he sends out specie for that purpose he involves himself in heavy charges for freight and insurance, and loses the interest of his money while on the voyage. Before it arrives, the prices of tea and silk may have been so altered in the market that he would not be inclined to buy, and his money would thus be placed where it is not wanted. But while drafts by the merchant in China on the merchant in

this country would not sell, or only at a heavy sacrifice, the drafts by the merchant in China on a banker in this country will sell at the best price. The merchant in this country therefore deposits with his banker, cash or securities equal to the amount to which he desires to use the banker's name, and receives from him *Marginal Credits* for the amount. These are bill-forms drawn upon the banker, but neither dated nor signed, with a margin containing an obligation by him to accept the bills when presented. The bills are dated, drawn, and endorsed by the merchant in China before being sold, so that the obligation runs from the date on which the money was actually paid, and the tea or silk is most likely in the merchant's warehouse before the bill is payable. For the transaction, the banker charges the merchant a commission, to remunerate himself for the risk involved.

Many other transactions between merchants abroad and in this country can only be carried through by the acceptances of a London banker being tendered in payment, but the transactions are intrinsically the same as when Marginal Credits are used. The banker in the country can arrange with his customer to obtain the London banker's credit for him. Bankers—usually in London—also accept bills to a great amount for the exchange operations of foreign banks. A banker in, say Canton, buys from his customers bills drawn upon merchants in this country for a given amount, and sends them to his correspondent in London, who holds them for him and grants a credit in his favour on the security of them. The Canton banker operates upon this credit by drawing upon the London banker, and sells his drafts at the most favourable exchange. With the money received he purchases other bills, and remits them also, to be again drawn against. When these operations are made with caution and sound judgment, they are beneficial to all concerned ; but when engaged in without sufficient knowledge or recklessly, they involve most disastrous consequences.

ON THE LAWN.

THE heliotropes within the garden-beds
Azure-crowned clusters shewed ; and scarlet blooms
Of rare geraniums mingled with the bells
Of white petunias ; calceolarias,
Their yellow purses fringed with rich maroon,
Swayed lightly in the breeze : the perfume sweet
Of mignonette, of fragrant cabbage-rose,
Spice-breathed clove-pinks, and odorous jessamine
Filled all the August air.

She comes, she comes !

Amid the green and shining laurel leaves—
The laurel clump that skirts the Rectory lawn—
I saw the gleaming of a snowy dress—
White muslin sprayed with blue. A soft fair face,
Of wondrous beauty, set in golden hair,
Looked out upon me, with a sweet shy blush,
The while the tender, dewy violet eyes
To mine were raised, as on the lawn she stepped,
That white-robed vision, whispering : 'I am here !'
The flowers bloomed fairer, joyous sang the birds,
For Love's sweet glamour gilded everything ;
'Twas Eden there, at least to two fond souls,
And I—unworthy Adam—found my Eve ! A. H. B.

THE CHILDREN'S TEETH.

BY A FATHER OF A FAMILY.

A VERY important subject—so important, that I will venture to ask all parents who have growing children not to pass hastily by this paper. Few persons fully realise the value of teeth till these are injured or lost. In the nature of things it cannot be expected that children should understand the value of their own teeth; and our knowledge, or painful experience, ought to be employed to guard them from the consequences of their natural ignorance. The well-being of the teeth in childhood concerns all their future life. Bad teeth mean bad digestion, and what *that* means some of my readers understand perhaps too well. Very good abilities may fail in good results for want of health and strength; and the decline of these is at times distinctly connected with imperfect mastication.

It must be admitted at the outset that the children's teeth often stand a very poor chance, or to be accurate, no chance at all. What things they do with their teeth! Crack nuts, untie knots, crunch hard sugar-plums almost like stones; in fact children do almost anything with their teeth, except clean them. Now, if the hair or nails are left uncared for, one quickly hears the remark, 'How Mrs Blank neglects her children;' but the poor little mouth may be a perfect magazine of future misery, and the neglect pass quite unnoticed. A man who gives his daughter an elegant set of jewels on her coming of age, is counted an indulgent father; but a man who has by his care secured for his girl a perfect set of teeth, has done a far better thing for her.

The first mischief I will notice is *crowding*. Very few jaws have room enough for all the thirty-two teeth which will in time demand their places. Nothing is more common than to find the teeth so crowded that one or more are pushed out of line, and project beyond the others, or lean inwards towards the tongue, instead of standing perfectly upright. And even where there is no such dis-

placement, there is sometimes an intense pressure; the teeth are jammed against one another with a tightness which is almost incredible to those who have not given any attention to the subject. Sometimes, indeed, a tooth will turn sideways under this severe pressure. Now, in such cases it is simply impossible that the enamel can be properly deposited. This hard outer surface is the life of the tooth, and when it is thin and weak, that life must be a short one. As soon as the enamel is gone, the inner bone quickly decays, until in time the nerve is reached, and then comes the acute pain known as 'toothache.' What is wanted in most young mouths is the sacrifice of one or two of the weakest teeth, in order to give the others room to get all the enamel the system can supply, and thus grow strong. Happy the growing lad or girl who has between the teeth sufficient space to admit a half-worn shilling! It will be his or her own fault if there is not a good set of teeth in that mouth in after-years. Yet I have heard an ignorant nurse express her dislike of a girl's mouth which had in it this promise of exemption from *curies* and dentistry, with all their tortures. But where there is not room enough, it must be made, and as that cannot be done by stretching the jaw, the only alternative is to thin out the crowded teeth, or they will in time destroy one another. But papa is often so busy, and mamma so tender, that the painful duty is put off, perhaps too long. And sometimes both parents are ignorant of the cruelty which they are unconsciously inflicting on their youthful charge—none the less real because unintended. I am not a dentist, and do not wish to be suspected of writing in the interests of that profession; but my own experience has made me very inflexible on this point, and when my pets' mouths shew symptoms of being crowded, they have an early interview with my good friend Mr Forceps. In too many cases, if the irregularity of the teeth is not very striking in *appearance*—that deity of feeble and narrow minds—the irregularity is suffered to continue, in miserable disregard of the fact that the presence of a few superfluous teeth

may insure the ruin of the rest, and cause untold suffering in after-years. Crowding, then, is the first point for parents to watch against.

Next of course comes want of *cleaning*. It is an unsavoury subject, I grant; but it cannot be passed over if the question is to be fairly dealt with. At the bottom of the teeth, touching the gums, may constantly be found a rim of some pasty substance, white or yellowish in colour. I speak of the mouths of children of course; grown-up sensible people know better than to allow any such unpleasant accumulation in their own. Now this substance is the deadly enemy of the teeth. It is often of a very acid nature, and eats away the enamel most certainly, and not very slowly. Let this deposit alone, and the teeth are doomed; for the 'neck' of a tooth—the point at which it touches the gum—is its weakest part. It is there, above all, that decay is likely to begin; and it is just at that point that 'stopping' is most difficult. Moreover, that deposit is promoted by the free use of animal food; small pieces of the fibre and of the fat cling around the teeth and get between them, keeping the mischief at work. To neutralise this, it is well to rinse the mouth with an alkaline wash, not too strong; ordinary soda-water being excellent for the purpose. Especially should this be done at night before retiring to rest, as the acids of the mouth gather strength in the night, and if habitually allowed to work undisturbed for eight or nine hours, can do considerable harm. Indeed if the teeth can only be cleaned once in the twenty-four hours, I unhesitatingly give the preference to the evening. Let the *débris* of the day's work be cleared away, and not left to undergo the chemical changes which are certain to ensue if they are left undisturbed for hours, with warmth and moisture to promote decomposition. The bad taste which is often found in a neglected mouth in the morning may prove to its owner that these cautions are warranted by facts. The unpleasant odour issuing from a neglected mouth is only too convincing to others. The habit of occasionally rinsing the mouth during the day is, when practicable, of great service. Those who cannot afford expensive toilet preparations will find that a very little plain yellow soap—a mere touch on the brush—is an admirable substitute for costly dentifrices and washes. Indeed I doubt if, as has before been indicated in this *Journal*, yellow soap is not in every way the best substance for cleaning the teeth.

And now a word or two about improper ways of cleaning the teeth. This is eminently a matter in which 'overdoing is undoing.' A lad is told of the evils of neglect, and resolves to attend to his teeth in future. He buys, or has given him, a brush as hard as wire; and with this—and perhaps a scouring tooth-powder—he rubs away with youthful zeal, might and main, at his luckless teeth. It is like the monks finishing what the Goths began. The movement is nearly all horizontal; the angle of the hard brush presses on the necks of the teeth; the water and the powder help its action, and the youngster might almost as well *file* away at the necks of his teeth. He can cut them by the combined action named above, as certainly, though not so quickly, as by filing. The brush should be soft, and the rubbing should be up and down, as well as along the

line of the teeth. Care should be taken not to place undue pressure on the bottom of the teeth, and especially not to apply the *angle* of the bristles to their necks. A quill toothpick may be used with advantage before beginning to clean the teeth, to remove anything that has lodged firmly; indeed, its frequent use is desirable, except at the dinner-table. Acid medicines are extremely injurious to the teeth, and should always be taken through a glass tube or a straw. The old muriatic preparations of iron and steel have ruined many a set of teeth. Happily, there are now solutions of iron which are not acid, but which had better be promptly washed off the teeth by rinsing, all the same.

To some readers these remarks may be familiar truths; many others will be but too well aware of their necessity. The results of ignorance and neglect in this matter are truly calamitous, and very extensive. I do not wish to see a generation rising up around me of young people who delight in 'shewing their teeth' on every occasion; but I should be glad to save some of the young from the inevitable results of carelessness; and I see—too often—young people for whom, I am sure, there is much future trouble in store. The family doctor might often render most valuable service to his youthful patients by taking more notice of their teeth. And he should not content himself with a mere hint; but if he finds the matter neglected, should explain its importance, and insist that what is needful be done. I hope this is not beneath the dignity of the profession. It ought not to be. All the resources of surgical science are employed to remedy a hare-lip; an important and most delicate operation is undertaken to cure a squint. (Appearances again!) Why then should a decaying tooth be left to infect its healthy neighbour? Why should superfluous teeth be allowed to injure the whole set? No one knows so well as a doctor what are the consequences of defective mastication and imperfect assimilation of food. Let him picture to himself the child's future sufferings from toothache and neuralgia, often culminating in dyspepsia and hypochondria, and he will scarcely hesitate to order the aid of a good dentist while it can be of real service. Of course there are cases of constitutional feebleness in which the teeth would probably decay whatever was done for them; but there is also, beyond question, much preventable mischief and needless suffering.

If this paper has the result of directing more attention on the part of doctors and parents to the children's teeth, it will not have been written in vain. Nothing which helps to lessen the sum of human suffering is unimportant; and on the stamina of the rising race depends the well-being of future generations.

YOUNG LORD PENRITH.

CHAPTER XLVIII.—BEFORE THE MAGISTRATE.

'VERY well, Mr Linklater,' said the capitalist to the confidential clerk, who, coming down by the earliest train that started in the gray dawning, alighted at Hollow Oak with the deed-box, lacquered, patent-locked, and with hinges of extra strength, in his careful custody; 'I am obliged by your punctuality. You had better stay, though. We are going, this gentleman and myself'

—pointing out Hugh—‘before a magistrate, and you might as well be present as an extra witness.’

Mr Linklater, one of those tall, gaunt Aberdonians whom the City of Granite sends out to do hard work and win hard cash by willing labour, was at his chief's disposal, of course. But he looked with no trifling perplexity from his employer to the young station-master, and back again, as if marvelling what connection there could be between scrip, shares, and discount, which formed the current grist to the mill at Guildhall Chambers, and country magistrates, Hollow Oak Station, and Hugh the master of that station.

But Mr Linklater, whose previous civic experiences had been eminently unromantic, and who knew more of tare and tret, of agios, caravan, commission, bulk-breaking, and other miscellaneous items of commerce, than he did of the real flesh-and-blood world outside the doors of a counting-house, had soon further cause for wonder. For into the station glided, ghost-like, the wasted form and weird face of Gipsy Nan, draped, it is true, in squalid garments, quite unlike the picturesque attire of her kindred in Spain or the East, but wearing them with a savage dignity such as would have beseeemed a prophetess of some barbarian race. She walked direct towards Hugh Ashton.

‘Follow me,’ said the gipsy boldly, ‘son of the Red Hand, for I am come to wash the stain of blood away! I saw the shot fired. I saw the man stagger, and put his hand to his side, and turn his face fronting his enemy, as a wounded stag turns on the dogs, and then fall. He tried to speak; but the blood ebbed fast, and the life with it, and he did not frame a word. But he is living yet who fired the gun. Ha! it will be a brave show when they bring James Grewler back, in chains, to Alfringham—a braver, when he hangs within the jail walls of Dorchester. Now I am ready, if you will, to go before your judge!’

At another time, Mr Dicker would have proved no patient listener to Gipsy Nan's tirade. But now he welcomed the woman's wild words, as lending valuable confirmation to the story which he and Hugh had to tell. The capitalist could not doubt that in Ghost Nan he saw the surviving sister of the gipsy emigrant who had died in Australia. Half-crazed she certainly seemed to be, and there were doubts as to how far her testimony would be respected at the Central Criminal Court. But, if she were not held a credible witness in the prosecution of Marmaduke Beville's real murderer, at anyrate her evidence was worth having on behalf of George, his dead brother.

‘Get her into the fly; it is waiting at the *Beville Arms* by this time,’ whispered the capitalist to Hugh; ‘and hold her there, by force if necessary, till we get to Marsden Hall. What should I have said, a week ago, if I had been told that I should alight at the door of a country gentleman, and one of our shareholders, in company with a half-mad gipsy beggar-woman like this!’

Sir Henry Marsden, Chairman, as Mr Mould the Director had truly said, of some Sessions, Petty or Quarter, within the shire of Dorset, was an active magistrate, and perhaps as favourable a specimen of Her Majesty's justices of the peace as it was possible to light upon. It might truly be said of him that he was an estated gentleman

and a baronet if you please, but a magistrate before all things. His estate bordered on that of Lord Penrith, and would have seemed more considerable had he not had a lord for his immediate neighbour. He had been invited to contest the county in parliament. But he thought little of the extent of his acres, and less of the chance of recording a silent vote at divisions, in comparison with his reputation for being able and upright on the Bench. There were barristers now and then in the modest court over which he presided who were irreverent enough to express the wish that all our legal bigwigs had the sense and patience of Sir Henry Marsden.

It was perhaps lucky that Sir Henry was the magistrate referred to. An ordinary squire might have been dull and helpless. A clerical justice, or some retired admiral pitchforked into the commission of the peace, would have boggled over every detail. But the baronet gave the whole case his best and most courteous attention, and such questions as he asked were thoroughly to the purpose. By good fortune the clerk to the magistrates was in the house, having come over to Marsden Hall on county business, and Gipsy Nan was persuaded to make her affidavit with tolerable coherence. There could be no reasonable doubt that the Nan, Nana, or Anne Cooper mentioned in the gipsy emigrant's death-bed deposition in Australia was the same person as the vagrant then present. As little doubt could there exist that the employer of Salem Jackson, in his treacherous theft of the Company's cash-box at Hollow Oak, was the false steward who had plundered Lord Penrith, and the real assassin of Marmaduke Beville.

‘We will get this sailor-fellow—this Jackson,’ said Sir Henry confidentially to Mr Dicker, whom he well knew by reputation, ‘immediately transferred from the care of the borough to the county police, and I will make a point of seeing him before I sleep. From what you tell me, I feel sure that he will save himself by revealing all he knows; and I feel equally sure of the identity of this Swart the Miller of Pen Mawth, in Cornwall, with the James Grewler who was steward when I was a lad at Alfringham, and who made off with a great sum of my lord's money. Yes, yes; there had been two generations of the Grewlers, stewards, before him; and this young James had been sent to the university at Lord Penrith's expense, for he was a good scholar; but he came away in disgrace, and his father was glad to get him made steward in his stead, here. The very year after the murder, old Thomas Grewler died, and this precious son of his levanted with a large sum. I thought he was dead. But I hope to see him committed yet for trial at the assizes.’

‘Shall we hang him—the Miller, I mean?’ asked Mr Dicker in a low tone, of the magistrate.

‘I'm very much afraid not,’ answered Sir Henry with a smile. ‘I am speaking now, of course, as a private person; but in my opinion the scoundrel will save that ugly neck of his. Juries, you see, are squeamish. The thing happened long ago. This queer woman’—dropping his voice still lower—‘is not to be relied upon. Any clever counsel for the defence could play the bear with her evidence. She has sworn to her brother's handwriting, and sworn to her own deposition; but I doubt whether twelve men in

a box would believe her in a matter of life and death. And she may never appear at the assizes. Why she came now, as a volunteer, it is hard to say; but perhaps she scented out, through some secret channel of information, what was on foot, and chose to have a finger in the pie. But if the Miller of to-day, and faithless steward of a quarter of a century back, escapes penal servitude for the rest of his rascally life, call me a false prophet!

Towards Hugh, the magistrate was not only courteous but kind. 'Allow me, Mr Hugh Beville,' he said, taking his hand, 'to be the first of your neighbours to welcome you, and to greet you by your own name. There is an old friendship between our families; and I knew your father, and your uncle too, poor fellow, in my young days.'

One duty, which could not well be deputed to a more appropriate person, Sir Henry undertook to discharge. He offered to go in person to Alfringham, without delay, taking with him the proofs of Hugh's descent, and of George Beville's innocence, and there, through Mrs Stanhope's intermediation, to break the news to the old lord.

'You should pity him—your grandfather, I mean—Mr Beville,' said Sir Henry Marsden, as he ordered round his carriage, having first, but vainly, pressed his hospitality on the unexpected visitors. 'We, who live near, have seen the canker of that mistaken belief poison his whole life.'

'I do pity him,' answered Hugh, in softened tones, 'from my very heart.'

Then Sir Henry, with all the papers in his possession, drove off to Alfringham, promising that on the morrow warrants should be issued, which, duly indorsed by the authorities of the county of Cornwall, would authorise the arrest of the Black Miller. Nan stalked off, ghost-like, towards the Forest, disregarding alike Hugh's thanks and Mr Dicker's offers of money; and so soon as the fly from the *Beville Arms* had jolted back to Hollow Oak, Mr Dicker took a kind farewell of Hugh, and went back, by the next up-train, to London, accompanied by his clerk. How strange it was to Hugh to find himself back at his little station, and to continue to perform his duties of routine, while his brain was in a whirl of excitement; and when he remembered that into the last few hours had been crowded more of stirring news than most of us hear in a lifetime. But his work, he felt, was not yet done until the murderer of his uncle had been dragged into the light of day.

CHAPTER XLIX.—LORD PENRITH DIES.

Left alone once more at Hollow Oak Station, Hugh began almost to doubt whether the events of the last two days were not merely the idle fancies of a dreamer's brain. So rapidly had one surprise succeeded to another, that a sense of unreality attached even to the recent vindication of his father's name. Hugh felt what we all feel when some goal to attain to which we have striven long is reached at last—a startling contrast between the marvellous ease with which success is grasped, and the painful efforts and anguish of hope deferred that preceded the final triumph. Not that in Hugh's case the success was even yet certain. His grandfather's prejudiced resentment against the son he had cast off might be impregnable to

proof or reason, and Sir Henry's kindly mission prove a failure. It would be hard if justice should not be rendered at the last to George Beville's memory, by the father whose good opinion he had desired so ardently to regain, and if Lord Penrith should choose to go out of the world without a gentle thought or fond word for the son who had passed his life in unmerited want and disgrace.

Hours passed, and no tidings came. Hugh went about his duties as usual; but for once he performed them with a cold mechanical precision, as a sleep-walker might have done. The porters collected in little knots, whispering to one another, and throwing sidelong glances at their official superior. Rumour is many-tongued, even at such places as Hollow Oak, and it was partly guessed, and partly known, that a great change was imminent in Hugh's fortunes. It was the dejection of his attitude and the anxious look which he could not conceal, that perplexed the men who watched him, wondering that sudden prosperity should bring with it so little joy. It was dusk already, and would soon be night, when through the gloom of the winter evening flashed the bright lamps of a carriage. It was an Alfringham carriage, and out of it sprang Dr Bland.

'Mr Ashton—Mr Beville rather,' said the doctor eagerly, 'I have come, at Lord Penrith's urgent wish, to ask you, to implore you to come to him at once. I have a note too—here it is—from Mrs Stanhope, begging you to lose no time. Delay may be dangerous. I will not disguise from you that my noble patient is sinking fast. He cannot, humanly speaking, live through the night. And he cannot die in peace—these are his own words—till he has been reconciled to George Beville's son.'

'I will go,' answered Hugh with emotion. 'Yesterday, I must have refused. To-day, I can cross the threshold of my grandfather's house with no feeling of anger or of shame.'

A minute more, and the carriage had rolled swiftly off towards Alfringham, with Hugh and the doctor. 'Is recovery or any improvement in his condition impossible?' asked the former, as they sped onwards.

'Quite impossible,' answered Dr Bland, more decisively than physicians can usually be brought to speak. 'For days it has been evident that his lordship's life hung by a thread; and the emotion caused by the news Sir Henry brought, gently as it was communicated to him by his sister, caused a syncope that lasted long, and which I feared would be fatal. His mind is clear now, and he has rallied somewhat; but I am convinced that it is but the last flicker of expiring vitality. My lord holds on to life for but one object, now.' The remainder of the short drive was passed in silence.

Alfringham at last! and the sound of the wished-for wheels had clearly been anxiously awaited, so promptly were the wide doors flung open, to reveal the lighted entrance-hall within. Hugh, guided by Dr Bland, entered, still feeling as though all around him stretched a dream-world, shadowy and unreal. He scarcely saw the marble columns, the polished floor, the gleam of statues, or the array of liveried servants to left and right, bowing their powdered heads in deference to him who, in an hour's time, perhaps, might be the lord of Alfringham.

All seemed real enough, however, though the reality was a strange and sad one; when, after traversing a portion of the great house, Hugh found himself inducted into the stately chamber in which the aged master of so much that the world covets, of rank, fortune, splendour, and power, had laid him down to die. Mrs Stanhope was there, and so was Maud, and both greeted Hugh as he came in, but silently and, as it were, timidly. All appeared to feel the involuntary awe that impresses itself on even the most frivolous when Azrael, the Angel of Death, spreads his sable wings above the house of the living. There was a solemn hush in the old lord's room. Even the feeble ticking of the French clock on the massy chimney-piece, even the feebler tinkle of the charred embers as they dropped, ruby-red, from the half-consumed logs blazing on the hearth, could be heard with a painful distinctness. Many waxlights were burning, and the curtains of the great bed, carved and gilded, were drawn back, so that the face of the old lord, almost as white as were the pillows on which it rested, could be plainly seen.

The first to break the oppressive silence was the dying man.

'Stand nearer—nearer to me, yet—Hugh Beville!' he said, in a thin, weak voice, but with an ineffectual attempt to raise himself. 'I am glad that you have come, boy—come to forgive the old man, before he goes. I—did your—father—cruel injustice, and'—Here his voice failed him, and he fainted; and they feared that he was dead, and crowded closer to the bed, while Dr Bland made haste to apply remedies. With some difficulty the old lord was enabled to swallow a few drops of the cordial that the physician had poured out, and as his eyes slowly unclosed themselves they lit on Hugh's face.

'I was not mistaken, then, as to the likeness,' muttered Lord Penrith feebly. 'I thought, at the station, that it was a spirit come to haunt me—the spirit of my poor wronged boy—but I know better now. You are very like your father, Hugh. He would have forgiven me, I know. Can you do it?'

'Indeed, my lord, I can,' answered Hugh, in a softened voice, as he knelt down beside the bed, and took the wan weak hand of the aged lord in his. 'But in truth there is nothing to forgive, only a sad mistake, and a sad estrangement, though my father never spoke of you to me otherwise than with affection and respect.'

'Poor George! poor George!' muttered the old peer, as he looked long and fixedly, regretfully, as it seemed, at Hugh's handsome sun-bronzed face and manly bearing. His conscience, lulled to rest through many years by the dogged conviction that he was right in his harsh judgment of the despised and discarded younger son, was painfully awake now, and perhaps he saw George Beville's gentle goodness of character in a clearer light than ever he had done before the family tragedy had been played out to the bitter end. There was something touching in the very earnestness with which the noble owner of Alfringham pleaded for pardon—for pardon from the grandson who had grown up as a stranger, amidst toil and adventure, in climes far remote. Lord Penrith had so wrapped and draped himself, through a long lifetime, in the mantle of his pride, that to see him cast it from him at the last might have melted a sterner heart than that of Hugh Beville.

'My poor banished boy—I wish I could have seen him once again, on this side of the grave,' said the old man, after a pause. 'But you err, Hugh, when you say there is nothing to forgive. May Heaven do so. I was wrong. I was unjust. My wrath blinded me. I would listen to no argument—no plea. And all the time I was a dupe! The knave who ate my bread, and rewarded my trust by treachery, he it was who spilled the dear blood of my murdered Marmaduke. Sir Henry Marsden tells me that Grewler is to be hunted down at once.'

'The man will be made to answer for his crimes, no doubt,' replied Hugh gently.

'Do not spare him!' exclaimed Lord Penrith, with a spark of the fierce energy he had shewn in his youth; but then his restless gaze, as it wandered about the room, fell on Maud's beautiful face, and his mood seemed to change. 'I had forgotten,' he said, almost humbly.—'You too, Maud, my dear, have something for which to blame your old uncle. You will be no heiress, now, dear. Alfringham cannot be yours, as I intended.'

'That will not make me unhappy, dear uncle, believe me,' answered Maud, bending over the dying man as he lay; 'I should have prized it only as your gift.'

'And,' said Hugh, looking up, as he knelt beside the bed, 'if my cousin—I may call her so, to-day—will accept my heart and my love, that have been hers since first we met beside the Welsh lake, and Alfringham along with them, I shall be prouder and happier than ever, in my brightest day-dreams, I dared to picture myself.'

Maud did not speak. All she did was to turn her blushing face shyly towards Hugh, and a glorious smile broke forth, for one instant, through her tears. For an instant only, for then she hid her face in her hands, and wept afresh, while her mother, with fond words of endearment, folded her in her arms.

'You love her, you say? You would marry her?' asked the old lord eagerly. 'Do you know, boy, that in taking her as your wife, you wed no heiress, but a girl, well born, but almost penniless; that not the Penrith coronet only, but Alfringham and all its lands, are your very own; and that you will be, as soon as I am dead, undisputed master here? Do you still wish, knowing this, to marry my niece?'

'I have only one answer to make,' said Hugh simply; 'I love Maud—Miss Stanhope I have always loved, but it was from afar off, as a man might love a star in the heaven above him.' And then he approached the weeping girl, and took her unresisting hand. 'Can you care for me, dearest,' he asked of her, 'rough and plain of speech as I am?'

Then Maud, allowing her hand to rest in Hugh's hand, made answer in her turn falteringly, but distinctly enough for her low accents to reach the ear of the dying man: 'Yes, my love, my love! I can care for you; have cared for you from the first, from the first!' And then she hid her head, sobbing, on her mother's shoulder; and Mrs Stanhope, weeping from mingled sympathy with her daughter and grief for her brother's loss, held out her hand to Hugh.

All had forgotten Dr Bland, who now glided quietly up to the bed, and administered to his

noble patient a few more drops of the cordial. The old lord's failing strength revived a little as he lay helplessly back among his soft pillows.

'That is well,' murmured Lord Penrith, looking alternately at the two fair young faces before him. 'You, my grandson, could not have a sweeter, truer wife than dear Maud Stanhope, and I have lived to learn that my poor George's son is a worthier lord of Alfringham than—— Never mind that. Hugh looks every inch of a Beville. I don't care a straw for the rest.—But, don't you think, Julia'—this was addressed to his sister, and the speaker's mind seemed to have wandered away, as the minds of the dying often do, far from the dread threshold that must so soon be crossed, far from the vague terror that guards the frontiers of the unseen world, to trivial matters which have to do with this one—'don't you think, Julia,' continued the old lord, in his thin reedy voice, 'that Hugh is the image of old Sir Beville Beville, whose picture hangs on the right-hand side of the gallery, between Queen Mary and Villiers, Duke of Buckingham? I never thought that George looked like that, and yet the two are so much alike. But I am glad the boy came—home.'

Home! It was with unaccustomed tears in his eyes, with an unaccustomed tightening of the muscles of his throat, such as grief brings to a strong man used to play his part manfully in a world of hard knocks and scant favour, that Hugh listened to the old lord's words. There had been a pathos in the last sentence which had dropped from those dying lips that had rarely spoken but to threaten or command, that told how different old Marmaduke, Baron Penrith, might have been, had his surroundings been different, had his second son but possessed, with his own gentle purity of soul, the steady fearlessness of Hugh's more self-reliant nature. But it was too late for that now.

'Kiss me, Julia!' said the old lord feebly; and his weeping sister bent to touch his pallid cheek with her lips. 'My will provides yet for you, my dear,' he added, trying to pat her cheek, with that contemptuous kindness which may through life co-exist with a sincere affection; 'and you'll have a better fellow for a son-in-law than that coxcomb Lucius.—Where's Maud? Let her kiss me too! I meant Alfringham to go to Maud; but it's all for the best—the best! Dr Bland, I have been, like some old king, an unconscionable time in dying, but I must ask you to excuse—— And Hugh? Not gone! Take me by the hand, boy. I feel as if, while I hold to that strong hand of yours, I hold to life. I wish poor George were here!'

It really did seem as though old Lord Penrith did hold on to life through the grasp which his feeble fingers kept of Hugh's strong right hand; and to the last the old lord strained his failing eyes to distinguish the bold, handsome features of the gallant young man who was to be his heir, and whom he acknowledged to be a fitting representative of the ancient stock of which he came. Then suddenly, Hugh felt the pressure of the weak fingers that clung to his, relax. With a smile upon his face—happier, it well may be, than he had been for five-and-twenty weary years—Lord Penrith had sunk back, and, without a struggle, died. Then Maud and her mother, weeping, were

led away; and Hugh too, slowly and sadly went, leaving the room to the solemn hush of death.

PICTURES OF RURAL LIFE.

THE business and bustle of modern life, with the drain they make on the nervous energy of the worker, render an occasional change of scene welcome and necessary. Numberless, however, as the pursuits of holiday-seekers may be, it is still self-evident that but few gather by mountain-side or sea-shore the full harvest of enjoyment provided in country life to the observant eye and cultured mind.

We have much pleasure in drawing attention to a volume entitled *Wild Life in a Southern County*, by the author of the *Gamekeeper at Home* (London: Smith, Elder, & Co.), descriptive of rural life, by one upon whom the mantle of Gilbert White of Selborne seems to have fallen. The pictures of rural life which abound in the book are drawn with unusual felicity; the dweller in town is transported by its help at once to the by-ways of the country; the habits and appearance of every bird in the hedgerows become familiar to him; the animal life of the forest is passed in review before him; in short the reader may live through the whole cycle of country life, so completely has our author sketched its leading aspects. In company with our author we are brought face to face with Nature in both her rough and her pleasant moods, in a southern county of England; and we feel sure that a country-walk with our friend would do more for our growing appreciation of Nature, than months of close study.

Some of the most charming descriptions here given, are those of bird-life. Reclining with our friend on the downs, with a noble view of hill and plain before us, we note the rise, the poise, and the descent of that sweetest of aerial songsters the lark. In early spring, above the green corn, love-making is in full progress; and far as the eye can see, the air seems alive with them. Around the many-gabled and thatched farm-house of Wick (the southern country farm described by the author), tribes of birds have loved to congregate, building in the ivy and in the eaves, the starlings taking up their abodes in the holes around the chimney. In the early summer, the latter are continually busy feeding their young; perching too, upon an ash about fifty yards from the farm, and chattering to one another in the most voluble manner possible, and only singing when a companion is within sight.

The chirp of the sparrow around the farm-yard is ceaseless. In the nesting season they are particular to secure the most fluffy feathers dropped by the fowls. Amongst the ripening corn they will flutter until they grasp an ear with their claws, and bending it down, revel in it at their leisure. Where the corn has been levelled by rain, they will attack it in hundreds at a time. Every spring the swallows return to the precincts of the farm, repairing their old nests, or building new ones, flying around and near the horses and cattle for the insects found there. In spite of the pity and commiseration drawn forth on behalf of poor cock-robin throughout so many generations of children, we have our belief confirmed that he

is a most pugnacious fellow, never missing an opportunity for a stand-up fight, and choosing the early morn for his battles. When the thrush has made up his mind to attack the ripe gooseberries in the garden, he works himself up in an indirect way towards them; the blackbird, on the contrary, makes a desperate rush forward, and retires about twenty or thirty yards with his booty. In the morning he may be seen in the stream taking his bath and splashing the water over himself with immense energy. Then he retires to a rail, where he prunes his feathers. Our author is never tired in listening to the rich liquid notes of the blackbird. 'There is,' he remarks, 'no note so sweet and deep and melodious as that of the blackbird to be heard in our fields; it is even richer than the nightingale's, though not so varied.'

The nightingale sings best on a fresh spring morning, on the upper and clearer branches of the hawthorn. It may be approached until within a few yards, when the swell of its throat may be seen as it pours forth a flood of melody. The elm is the favourite tree chosen by the rooks for nest-building, and they shew a marvellous instinct in selecting the proper boughs and in placing the twigs. The young birds quickly gain the use of their wings, and a few days of difference may ruin the prospects of the rook-shooters. The young birds are easily distinguished when the shooting is in progress; the old birds meanwhile rising in the air out of reach. A few leaden pellets will pick them off; and he who handles them is mercifully warned regarding the vermin which covers them. As late as July the young crows—as big and black as their parents—may be seen in the fields, receiving lessons from them how and where to feed. Rooks have their special haunts and feeding-grounds, and observe certain rules which are handed down from generation to generation. Thousands of them will act in concert, and as if in obedience to a certain word of command.

We feel, in reading the descriptions of rabbits at play near the warren; of ferreting; how to secure a corn-crake in the mowing-grass; the description of a spaniel and hedgehog; of the snakes in the field, and the water-fowl by the lake, that the writer's sympathy with animate and inanimate nature is as close and sympathetic as that evinced by Gilbert White or the Bauff Naturalist. The gambols of the rabbit afford him real pleasure to watch. He will tell you, if you wish to look for wild-flowers, that a much better place than the open field is the narrow uncultivated strip beside the hedge. There in season you may find the white convolvulus, the scarlet poppy with the black centre, and the pink pimpernel.

A walk across the downs, upon a green track which must have been a military road, carries our author, in imagination, to the time when the fierce Dane carried fire and slaughter inland, or to the time when the eagles and chariots of old Rome passed along it. With a crook to pull down the branches gradually without injuring them, we go a-nutting, and are told how to enjoy the full flavour of the fruit on the spot. Our friend has something to say about the bees in the garden, the haunts of the butterfly and the wasp, the toad and the fox. The snake loves the

dry sandy bank, crawling forth when bright weather comes; the female frequently deposits her eggs in a manure-heap near the farm-yard. When discovered by the mowers in the field they are killed without mercy; and they will go the length of telling you that if a man sleep in the fields with his mouth open, a snake will sometimes crawl down his throat! Snakes also get the credit of breaking and sucking eggs. Our author introduces us to all the varieties found in his neighbourhood, and assures us that a forked stick is best to catch them with, as it pins the head to the ground without injury.

Full as is our gossip companion of lore, connected with field and stream and copse, he gives us much pleasant insight to matters pertaining to indoor farm and village life in his southern county. Life there, we are told, moves on with but little variety from day to day, from year to year. Many home industries are nearly extinct in the village; still a few old women gather the stray flakes of wool after the sheep-washing in the brook, caught in a net spread for the purpose, and manufacture stout mops, which are readily enough bought by the farmers' wives. The wool is worked up by means of the ancient spinning-wheel. From the willow-trees of the brook, which are cut and split into flexible strips, ladies' work-baskets and endless nick-nacks are made. The making of hurdles for stopping gaps in fields, is another industry; but we are told that the master-carpenters in the large towns have undersold their village competitors. The wheelwright and the blacksmith are always busy. Besides the tinker, the cobbler has a good time of it too, the rough damp roads requiring a home-sewed boot to keep the feet dry. Gleaning in the fields in autumn, though it has declined much, is still practised. The cottagers, next to their gardens, love plenty of out-housing, and sheds where they may store wood, lumber, vegetables, &c., a fact which is sometimes forgotten when the modern labourer's cottage is built.

The descriptions given by the author of the older shepherds, remind us of the realism of Thomas Hardy in *Far from the Madding Crowd*. While more observant than the older labourer, the shepherd knows every field in the parish, the soil, and what weather suits it best. His books are the open fields and the hill-side. His knowledge and fidelity are chiefly put to the test in lambing-time. The modern greatcoat is now taking the place of the 'smock-frock' with him; while the aged men stump along the country road with their great umbrella slung over their shoulders with a piece of tar cord, and their staff projecting six or eight inches above the hand. The Lady-Day fair and the Michaelmas fair are the standard holidays of the farm maid-servants, affording a capital opportunity for the men and women of the neighbourhood to exchange the news and see the sights. Previous to Christmas, mumming, the singing of carols, and instrumental music, are often engaged in and practised.

Nathaniel Hawthorne would have found himself at home in the homestead of Wick Farm, which has been occupied by six or seven generations of the same family. Memories of the past have accumulated around it; covered with brown thatch it stands hidden and retired amongst trees, with cherry and pear against its wall of subdued

brick. The solid furniture within is stiff and angular; with quiet nooks and corners, and over all a suggestion of flowery peace and silence. The oaken cupboards contain a few pieces of old china. The lumber-room contains ancient carved oaken bedsteads; linen presses of black oak with carved panels; a rusty rapier, a flintlock pistol, and a yeomanry sabre which was used by the farmer in riding forth in the turbulent days. The parlour mantel-piece is always decorated with flowers in their season—in spring with boughs of horse-chestnuts, lilac, blue-bells, or wild hyacinths; in summer with nodding grasses, roses, and sweet-brier; while in autumn, two rosy apples may be seen gracing the shelf, and the corners of the looking-glass decorated with ripe wheat. In glass cases are preserved the various animals which may have been shot on the farm—two stuffed kingfishers, a polecat, a white blackbird; over the doorway there is a fox's head, and a badger's skin lies across the back of the arm-chair. The walls are adorned with two old hunting pictures, crudely and hardly executed.

The mistress of the house still observes the good old habit of baking; she can make all kinds of preserves, besides cowslip, elder-berry, and ginger wines. When the anxieties of harvest are over, the people of the farm can spare a day or two for the occasional picnics which take place while the sun is still warm and the sward dry. Although the farmer is independent of a landlord, he yet gives, by way of compliment, the first of the shooting to a neighbouring land-owner, and loses nothing by his liberality. From November until the end of January the farmer usually carries his double-barrelled gun, for a chance shot at ground-game or wild-fowl. About Christmas-time the traditional four-and-twenty blackbirds are shot, and baked in a pie; an apology for a social gathering, with cards and music. Some of the better-class farmers who keep hunters, ride constantly to the hounds; whilst the local steeple-chase, whither flock crowds of labouring people, is the most popular gathering of the year. And when the auctioneer is called in, as he is very frequently nowadays for the sale of lambs, young short-horns, or standing crops, a great dinner is prepared, at which sherry takes the place of ale.

The summer day begins very early at Wick Farm-house; at half-past two in the morning, the swallows begin to twitter faintly below the eaves; by three o'clock the cuckoo is calling from the meadows, and the mower is whetting his scythe while the day is cool and the dew on the grass. Between three and four the thrushes have begun to sing in the copse at the corner of the field; shortly afterwards may be heard the shoes of the milkers clattering in the court-yard; then their voices may be heard crying to the cows in the meadow, 'Coom up! Ya-hoop!' as they troop to the milking-place. The household breakfasts begin about half-past six; between eleven and twelve is luncheon-time; and dinner comes on about four o'clock. By six o'clock, work is over, the women having been allowed to leave the fields half an hour earlier, to prepare their husbands' supper.

The associations connected with a wagon are pleasantly described by our author; the child rides in it, as a treat, to the hayfield with his father; then the lad walks beside the leader, visiting the market-town for the first time; when

manhood arrives he takes command of the wagon; when he is married, it brings home his own furniture; and perhaps his own children in turn ride in it. When old and weak-kneed, it carries him in pity to the neighbouring town, and eventually may carry him to the churchyard on the hill.

The book, of which we have given but an imperfect sketch, is a most refreshing one to read. The author seems to combine the observant eye of Frank Buckland with the natural raciness of Gilbert White. Like his former work, the *Game-keeper at Home*, the present one is penned in a simple natural way, which carries the reader away into rural by-paths never before trodden by him.

THE DAY YOU'LL DO WITHOUT ME.

IN TWO CHAPTERS.—CHAPTER I.

THE day was full of the sweetness and light, the glory and warmth, that only summer can shed over and extract from the land. Down to the left of the verdure-covered old vicarage-house—where the chief action of the story I am relating took place—broad meadow-lands lay bathed in a purple haze—purple haze that spoke of intense heat in the open, and that made even the self-absorbed young pair under the trees on the lawn, grateful for the shelter afforded them. Any one who had seen them there would have seen the naturalness of such self-absorption, and at the same time have felt sorry for it. For though the dawning liking between them was 'natural,' it was not fit. The girl was the third daughter of a poor country parson, who eked out a slender professional income by taking pupils. The boy was the highly prized son of a noble house. And still they were allowed to be together!

The young fellow of seventeen, though he had not come to his full heritage of manly beauty yet, was a very worthy idol, so far as appearances went, for a young girl to set up and worship. He had the slender, clearly defined, delicate form and features that belong to the handsomest race in the world—the English aristocracy. There was a look of 'breed' about him that was unmistakable—that look that is never seen unless blood and culture have aided in producing it. What wonder, then, that May Baron contrasted him with the well-to-do young farmers in her father's parish; and having done that, erected an altar in her heart, whereon she worshipped Lionel Hastings unceasingly! She was supremely happy this morning, for her mother had given her a half-holiday to dispose of as she pleased. That excellent mother, on household cares intent, quite believed that she would go off for a stroll in the woods with some girl-friend, as it had been her wont to do from her childhood. But Lionel magnificently ordered her to 'stay and read poetry to him under the weeping-willow;' and she was only too pleased to obey him.

The sunbeams fell down like scattered gold through the leaves, fell down flickeringly on the two young heads; the boy's covered with crisp curls of dark-brown; the girl's crowned with such golden tresses as only fall to the lot of one woman in a thousand. The masculine head reposed comfortably on the boy's own folded arms. The feminine one was bent down over a volume—a collection of miscellaneous poetry—from which she was reading lines and verses at random.

'This is very jolly!' Lionel said languidly, for

the heat was subduing him. His only reason for speaking at all was that May had kept her violet eyes cast down on her book for a long time, and he liked to look at them often.

He had his 'taste's desire' at once. Without a moment's tantalising delay, she lifted her silken fringes obediently, and bent her honestly adoring gaze upon him, as she said sympathetically: 'Yes; isn't it? No lessons, and such sunshine!'

'And you so jolly pretty!' he cut in with a vast increase of energy. Then he withdrew one arm from under his head, and flung it round her slender waist; slender certainly, for though May was sixteen, she was symmetrically and perfectly formed. 'Now, you may go on reading,' the young sultan said, as May acknowledged his caress by saying: 'Oh, dear Lionel!' A rosy colour flushed the girl's face. The thought that perhaps she ought not to let Lionel Hastings treat her as he might his sisters, crossed her mind, and clouded her happiness for an instant. Then in her purity and innocence, she blamed herself for even that thought, condemning it to herself as 'dreadful.' Then in her confusion she began reading at random, selecting by chance the very poem she ought not to have selected. It was an American poem, written by an anonymous author, and deserves to be more widely known than it is. One verse ran thus:

You call me true and tender names,
And gently twine my tresses;
And all the while my happy heart
Beats time to your caresses.
You love me in your tender way!
I answer as you let me;
But oh! there comes another day—
The day that you'll forget me!

Her voice had faltered more than once in the reading, and he had watched her confusion, and enjoyed it with half-laughing malice. Boy as he was, he knew so well what was in this young girl's heart. He thoroughly understood her sudden shame, and perfectly realised how keenly the dread that he might go away and forget her, cut May Baron.

'Look at me, pet!' he said with sudden authority.

'I—I am looking for something else to read,' she stammered.

'Look at me, and confess! Aren't you sorry you read those lines, because they describe your own situation and feelings to a certain degree?'

'Lionel, don't be so rude and cruel.'

He had taken her chin in his hand, and turned her face towards him. And she knew that her face was telling the truth, that she loved him much! 'My own pet!' he said, more softly and seriously, 'I shall never go away and forget you—trust me for that.' Then he reared himself up, and kissed the little face that was rich with happy blushes now; and May was well content to believe him. 'I shall have you painted by Millais,' he said presently, lying back and regarding her critically.

'Shall you!' She was alight with pleasure at the way in which he was assuming the right to direct her and manage for her in the future. 'Who is Millais? Is he any one I ought to know about?'

'He's one of the greatest painters alive,' he said

with reproving gravity. 'I don't know that I shouldn't put him at the top of the list of English painters, if it weren't for Leighton's conflicting claims. Of course you ought to know about him, pet; only, how should you know about any one while you're kept cooped up here!' Then he went on to tell her that Millais had painted his two sisters, both of whom were great beauties and celebrated belles, and both of whom were married to peers of the realm. 'They were the youngest brides of their respective seasons,' he added. 'Ida was only sixteen.'

'Sixteen! my age!' she exclaimed in astonishment.

'Yes, by Jove! you *are* sixteen. But my sister Ida looked much more of a woman. She had no end of offers; but my mother knew that St John would come on at the end of the season, so she kept Ida free.'

'It was lucky your sister Ida didn't care for any of the others,' she suggested timidly.

'She did though. She was an awful goose about a fellow called Bartie Friel; but he hadn't the needful. The best of it is that he's St John's cousin, and introduced St John to Ida. He thought'—the boy paused, and laughed lightly at the absurdity of it—'that Ida would win old St John's liking, and get him to give Bartie something good; but Ida won something more than old St John's liking—she won the title and coronet.'

'And his heart?'

'His heart! I don't know about that; he's popularly supposed to have lost his heart thirty years ago to my mother.'

'Then he must be quite old?' May questioned in angry surprise. 'Tell me, Lionel, is he quite old and gray?'

'Of course he is. He's fifty, and Ida's eighteen.'

'Poor thing!' May ejaculated with honest pity.

'Very few people speak of Lady St John as "poor thing," I can tell you,' he said, laughing. 'She's the leader of about the best *coterie* in London.'

'Poor Mr Friel then,' she then said softly.

The boy's face clouded. 'Bartie Friel is'—He stopped himself abruptly.

And she asked with interest: 'Is what?'

'Never mind; I can't tell you, pet. Something you ought not to hear till you're a fashionable lady,' he added half sneeringly; then he ended by saying: 'He's not half such a good fellow as old St John after all.'

They were summoned to luncheon soon after this; and May went in dreamily, her head being full of faint outlines of the romances in real life of which Lionel's sister Ida was the heroine.

The dining-room of the picturesque vicarage was as dreary an apartment as drab furniture and dingy papered walls could make it. Nature had done a great deal for the room, by throwing garlands of blush-roses and French honeysuckle across the lattice-windows; and through these floral shades the sunbeams fell in the dancing, graceful way in which sunbeams do play through leaves. But alas! all beauty and grace came to an end here. The coarse, crude, time-worn, children-torn furniture could not be beautified even by the sunbeams. We are so apt to accuse the mistress of a house of 'want of taste,' if her surroundings are ugly and stiff and soiled. But how can a woman with an empty purse and full hands drape

windows artistically, and polish up her household gods perpetually? Poor Mrs Baron most certainly had not solved the difficult problem of how this was to be done. She had seen things fade and grow more and more dilapidated year by year, and she had made strenuous efforts to repair them. But repairing is not replacing, and things had been meagre even at the beginning; so now it was but a small wonder that an air of dull though decent poverty should reign over everything inside the house.

It may be asked: 'But with daughters who were grown up, should the taste of beautifying, or of attempting to beautify, have been left to the already over-worked mother and manager?' The answer is simple enough. The two elder girls were wearing their way through the world as governesses. And May's education was incomplete, she being only sixteen. Truth to tell, May had never troubled her handsome little head about any of these shortcomings of her home, before this awakening day. But now when she sat down to luncheon, something about the arrangement of the table, something about the dinginess of the room, struck her as being sordid and utterly inharmonious; utterly out of keeping with the refinement that surrounded Lionel Hastings like an atmosphere.

Her meditations on this subject were put to flight abruptly. Her father spoke in agitated tones—tones which the poor wife knew so well portended fresh anxieties, fresh struggles, fresh combats with poverty. 'Lionel, I have had a letter from Lady Hastings this morning; she thinks that the sooner you go to Oxford the better.' Mr Baron's voice trembled very obviously. Lionel's 'going to Oxford' meant the direct loss of three hundred a year to the poor over-wrought vicar of Balton.

It is needless to recapitulate here all that was thought and felt and said, after the key-note of separation had been struck. In the midst of the boy's natural delight at the proposed change, there was a pang of regret at the idea of parting with May. Pleasure and sorrow were delicately blended in his heart, and they filled the situation with emotional interest. But in May's heart it was all pure sorrow, unmixed with any pleasurable sensation at all. He was leaving her, going to Oxford; going to be 'a man,' going to 'begin life;' and in these facts he found compensation for leaving her. But she only felt that she was losing him! For her, there was no compensation either in the present or the future. Lionel was going away! With the bashfulness of a girl's first love, she never once thought of censuring him ever so slightly for not feeling this approaching separation painfully, as she felt it. It was natural, she told herself, that boys should long for and revel in the commencement of their emancipation from the trammels of their boyhood. Especially was it natural that Lionel should do so. Light as her father's rule over the lad was, still it was rule, and Lionel was born to be 'free,' if ever human being was so. Thus she reasoned and argued against her regret at his going, and went on regretting it just the same. The positive difference which would be necessitated in the household arrangements by the loss of that sum, which Lionel represented to her mother, never occurred to her. She was too young and loving and

thoughtless to cumber herself with domestic cares, or take thought for the morrow of domestic life.

It did not occur to Lionel that he ought to say something more definite than he had said to the girl, whose whole horizon was darkened by the thoughts of his departure. He had meant loyalty and lovingly; and so, when he kissed her on the lips, and put a little gold ring on her finger, he thought he had done all that was needful. When the time came for him to marry—fellows of his 'order' married early—he should marry May, of course. Meantime it was useless to talk about it. And May relied unconsciously upon the fidelity he did not plead; but still thought far more impatiently about that 'meanwhile' than he did.

At last the day came for them to say good-bye, and the boy went out into the world; when a thousand fresh interests sprung up like flowers in his path, making it beautiful. And May went about the old vicarage-house and grounds as of old, and found the days very long and eventless, now that there was no Lionel to brighten them.

Lady Hastings wrote a courteous letter to Mr Baron, thanking him for the care and attention he had bestowed upon her son. And Lionel himself wrote a nice note to May during his first term—a note which May prized next to her twisted gold ring; though there was little in it save an account of his feats on the river, and of the prowess of a certain well-pedigreed bull-dog pup. She answered it with all the frank confidence of a child—all the hearty, loving sympathy of a woman. And then it ended.

Gradually the old vicarage-house and all the occupants of it faded from his mind. Life was full of bright promise for him, and he had no time to look back. He finished his college career with more than credit. He was a touch more than clever, and his impetuosity stood him in stead of perseverance, and carried him well on the road he had chosen. By the time he was five-and-twenty he had done such good service to government by the subtlety, skill, and energy with which he had carried through a delicate negotiation abroad, that government recognised his claims munificently, and gave him an important and highly salaried home appointment. In fact Lionel Hastings had made his mark, and the mothers of daughters regarded him kindly.

The years had flown with him, the eight years that had passed since he had said good-bye to May Baron, and promised never to forget her. But they had not flown with her.

THE INNS OF COURT.

THE four Inns of Court—that is to say, Lincoln's Inn, the Middle Temple, the Inner Temple, and Gray's Inn—combine to form what is in fact the legal university of England—if by the word university we may imply an examining body which has framed specific regulations for the admission of students, the 'keeping of terms,' the conduct of examinations, and the granting of degrees. Of the history of the Inns it is not our purpose to write; and on that subject indeed, very little could be said within the limits of a magazine article; but we may perhaps effect a useful end if we confine ourselves to roughly sketching the process by which a layman becomes a barrister.

Firstly, then, it has been decided that every person, not otherwise disqualified, who has passed a public examination at any university within the British dominions, is entitled to be admitted as a student of any of the four Inns of Court without passing a preliminary examination; but no attorney-at-law, solicitor, writer to the signet, or writer of the Scotch courts, proctor, notary-public, clerk in Chancery, and certain other professional men, shall be admitted as a student at any Inn of Court until such person shall have entirely and *bond fide* ceased to act or practise in any of the capacities above named or described; and if on the rolls of any court, shall have taken his name off the rolls thereof. The Society of Lincoln's Inn also requires that the candidate shall not be a person who is in trade; and a declaration to the effect must be signed before further progress can be made. The aspirant then signs and delivers to the steward or treasurer of the Inn a formal statement of his wish to be admitted as a student; paying for the form on which he makes such statement the sum of one guinea; and the declaration of fitness must be vouched for by two barristers, and approved of by the Treasurer or by two Benchers of the Inn. Supposing the candidate never to have passed a public examination at any British university, he must forthwith present himself before the Board of Examiners appointed by the four Inns, and demonstrate to their satisfaction, both by writing and *viva voce* if necessary, that he possesses a competent knowledge of the English and Latin languages and of English history.

Having passed his examination, the candidate is admitted, and pays five guineas for the right of attending during his studentship the lectures of four professors appointed by the Council. He also pays other sums, which vary at each Inn. If he become a member of Lincoln's Inn, these include a 'fine' of eight pounds eleven and sixpence on admission, twenty-five pounds two and sixpence for stamps on admission, and one hundred pounds as a deposit, to be returned on call to the Bar or on leaving the Inn, on payment of all arrears of commons, &c. The last payment may be avoided by the execution by third parties of a bond for the amount; but as the fees on call come to nearly as much, there is but little to choose between the two methods, for sooner or later, a hundred pounds must be paid. These are necessary disbursements; but they do not by any means represent the total expense to which the student renders himself liable; for, except for the mere grains of legal instruction he may obtain at the public lectures of the four professors of Jurisprudence, Common Law, Equity, and the Law of Real and Personal Property, he has not yet contracted for his technical education. Still, it should be noted that no one need go either to lectures or to chambers unless he thinks fit; and that so long as the student is able to pass his examinations previous to call, he may obtain his knowledge from whatever source is most convenient to him. He must, however, in all cases pay the lecture-fee of five guineas.

So much for the process by which a man may educationally qualify himself for the final examination and call to the Bar! Even more important is the process of formal qualification. Who has not heard of the ordeal of 'eating dinners?' To him who would be a barrister, food for the

body is as necessary as food for the mind; but while the Council of Legal Education cares not whence the mental pabulum is derived, it most strictly exacts that at least a certain amount of the physical dietary must be partaken of within the Hall of the Inn to which the student is attached. The inexorable regulations prescribe that, with insignificant exceptions, 'every student shall have kept twelve terms before being called to the Bar.' The rule might have been made by Epicurus, for it means in plain language that no student shall be called to the Bar until he has eaten a certain number of dinners at his Inn. In the case of members of an English, Scotch, or Irish university, this necessary number is three per term; and in that of other students, six; so that the miserable man who, not being affiliated to a university, would aspire to be a barrister, must first eat no fewer than seventy-two dinners, as served for him by an unsympathetic cook.

Of these dinners a volume might be written, nay, two—one of complaints and one of praises. At Lincoln's Inn, the huge Hall is traversed at the north end by a table, at which dine the Benchers in august state, separated from the vulgar crowd of barristers and students by an array of sideboards. Then, also running from east to west, are two tables dedicated to the *apprenticii*, or barristers aforesaid; and lastly, running from north to south, are several tables for students. Dinner is at half-past five on week-days, and at five on Sundays; and about ten minutes before dinner-time the Hall begins to fill. As the student or barrister enters by the south door, he is received in the lobby by a servant, who relieves him of his stick and coat, and by another who robes him in a gown, the property of the Inn. In the Hall he probably finds a friend or two, with whom he arranges to 'make a mess;' that is to say, to dine, or as others phrase it, 'to make a table;' and with them he stands talking with his hat on, until, as the clock strikes, the head-butler solemnly marches to the west end of the long sideboard, and by means of three blows of a hammer, exhorts to comparative silence. 'Making a table' consists in four men agreeing to dine together and taking possession of two places on each side of one of the long 'boards;' the four sets of knives and forks thus forming a square. At the students' tables, he who sits at the north-west corner is captain of the mess, and in him is the right of deciding what wine shall be drunk by himself and his friends, unless some one chooses to ask for port, in which case port must be brought. Otherwise, on ordinary occasions the choice lies between two bottles of *vin ordinaire*—and very *ordinaire* it is—or one bottle of good claret, or one bottle of sherry between the four, beer *ad libitum* being forthcoming as well.

Dinner is seldom quite punctual; but in due course the head-butler goes again to the sideboard, and with great *empressement* announces: 'Benchers, gentlemen!' whereupon every one in Hall respectfully rises. The dons enter, in Indian file unless guests are present, by the north door, bowing as they come; and then all remain standing for a minute until the head-butler once more raises his voice and cries: 'Silence, gentlemen, if you please.' This is the signal for the chaplain to ask a blessing. Forthwith every knife and fork begins operations, unless, of course, there be soup,

in which case the man sitting on the left of the captain of the mess helps himself first, and then passes the ladle to the right. The same plan is pursued with fish. But for the captain himself is reserved the privilege of first cutting the joint which follows, and of then passing it on, always to the right. A butler has meanwhile placed the wine on the table; and he who sits on the captain's right is the first to taste it, as also he is the first to partake of the dish—generally a fruit-tart—which succeeds the joint.

The method in which the wine should be passed is somewhat complex, and there are, we imagine, but few students who clearly understand how it should be done. One rule, however, it is advisable to remember. As a man hands the decanter to his neighbour for the first time, 'he begs to be allowed the honour of taking wine with him:' and the omission of this custom is the infallible sign of a freshman. But all the Inns—and Lincoln's Inn especially—are nests of venerable customs, the propriety and the antiquity of which may not be disputed; and though fines for non-observance of them are no longer the fashion, they still exist, and will doubtless continue to flourish.

One night in each term is called Grand Night; and on that occasion a somewhat better dinner than usual is provided, and guests—usually legal and political celebrities invited irrespective of party—dine with the Benchers, who, if there be any truth in rumour, not only 'fare sumptuously every day,' but absolutely 'aldermanise' on these festivals. For their banquet they pay nothing; barristers paying half-a-crown; and students a guinea for the first six in each term, and two shillings per dinner afterwards; and in all cases wine is included.

Dinner over, the head-butler again implores silence, and the chaplain says grace, releasing the students, who immediately depart, but causing no emotion in the Benchers and barristers, who still sit at their leisure. The interval between the blessing and the grace is usually an hour; but after the great body of students has departed, two or three usually remain 'to be introduced to the Bar-table,' in accordance with the special regulation of the society, which exacts that 'no student can be called to the Bar who has not been three times introduced to the Bar-table after dinner, once in each of three different terms; and one of such introductions is to be in the last year before his call to the Bar.' The ordeal is not very trying; for it principally consists in the student walking rapidly between the two Bar-tables, whereat sit some fifty inattentive or preoccupied legal luminaries; but before undergoing it, he has to renew his declaration that he does not fill any disqualifying office, and to certify that he is not in trade.

The necessary expenses previous to call are at Lincoln's Inn something like one hundred and fifty pounds. At the other Inns the total is, we believe, generally less, amounting to about one hundred and twenty pounds. Further expenditure on books, &c. may very easily raise the cost of being called to the Bar to three hundred pounds; a sum exclusive of the cost of living during the twelve terms which have to be kept. Yet the Inns are crowded with students, and never, probably, were so many men called to the Bar

in one year as during 1878. Legal business is always increasing, and it is an undoubted fact that, as the practice is simplified, so the number of cases, both litigious and otherwise, grows proportionately greater. We have no longer many of those old family Chancery suits which bled our grandfathers to death; but by way of compensation, we find that nowadays nearly every man who will 'have the law' on his neighbour, has dealings with a solicitor, and through him with a barrister. For every one, save for barristers and their providers, the question is so serious a one, that our advice to all who are litigiously disposed is—think twice before 'going to law.'

INDIAN SNAKE-STORIES.

I WAS a passenger on board the Peninsular and Oriental steamer *Medina*; one among several young fellows who had started in various capacities on our 'trial trip' to India. We had encountered some rather rough weather after quitting the Red Sea, but that was all over; we had had favouring gales for several days, and were now within twenty-four hours or so of Bombay. Our promised land was almost in view; we were full of its many and varied attractions; all the dark colours had vanished from our picture, and our imaginations were kindled by the recollection of all we had read and heard; and we longed to realise for ourselves the new and strange experiences which we hoped were in store for us. India and Indian matters were now the staple topics of conversation; those going out for the first time were eagerly seeking information on many points from the 'old staggers' among their fellow-passengers; and some of these worthies were a little inclined to improve the opportunity, and treat the 'griffins'—as the new-comers are usually called—to not a few travellers' tales. For my own part, I had made several good friends among the old Anglo-Indians on board, had learned much from them of practical importance to myself, and had listened to many a capital anecdote on matters relating to social life, and to hunting and travelling experiences.

It was our last evening but one in the *Medina*, and a group of us were sitting on deck after dinner, enjoying the pleasant light breeze that was blowing, chatting over the various incidents of the voyage, and discussing the probabilities and possibilities that awaited some among us in our new home. Elephant-hunting and tiger-shooting were passed in review; and some anecdotes of rather a thrilling nature were related.

'The big game are getting very much shot down,' remarked an old Judge, who had been many years out. 'Tigers are quite scarce now, compared with what they used to be. In fact it is becoming rather difficult to find them.'

'All the better too,' replied a fat good-natured little man, Dr Beamish. 'The existence of tigers is only desirable to a parcel of idle sportsmen, and it is to be hoped they will gradually be exterminated or nearly so. The rewards offered

by government have done much to effect this ; and I hope the time is not far off when one may take an evening stroll without the risk of being carried off to form the supper of a family of hungry cubs.'

'I don't think tigers are the chief objection to an evening stroll,' said Mr Barry, a civilian of some standing in the Bombay Presidency. 'I can't say I ever encountered one myself, unless I went specially to look for it. Except those horrid brutes the man-eaters, who stick at nothing, a tiger will generally keep out of your way if you keep out of his. The snakes are the real obstacle to a comfortable walk. There is something peculiarly disagreeable in the idea of kicking what looks like a bit of wood out of your way, and getting in return a small prick from a cobra, which leaves you a dead man an hour or two afterwards.'

'Ay, a good deal sooner than that, sometimes,' observed Dr Beamish, nodding his head. 'A few years ago our regiment was going from one station to another, and one morning we were marching before daylight, when a native servant, who was very near me, uttered an exclamation of pain, and put his hand down to his foot. I asked him what was amiss, and he replied that a thorn had gone into his foot, and was hurting him badly, and making him feel sick. He staggered as he spoke ; and bidding him sit down, I called for a light, and bent down to examine the place, and try to extract the thorn. Not many minutes had elapsed, but the man was now very faint and unable to support himself, so I strongly suspected it was something more than he fancied. A moment's inspection showed me two tiny punctures like stings ; a small livid ring was already forming round the place, and I became seriously alarmed for the poor fellow, for what he had imagined to be the prick of a thorn, was the bite of a deadly snake. Excision of the part, and brandy and other restoratives were immediately administered ; but all to no purpose ; the poor man was a corpse in less than an hour from the time he had been bitten.'

'How horrible !' was the general exclamation.

'It must be a most deadly poison to act so rapidly,' said a gentleman who stood near the doctor. 'Has no antidote ever been discovered to counteract it ?'

'None that can be relied on,' replied Dr Beamish. 'The bite of the cobra *de capello* is certain death to the unfortunate victim ; and that within a very short space of time. I have known many instances of individuals having been bitten, and heard of many more ; but I never encountered a case in which the sufferer recovered from the effects of the poison, though I have heard of such a thing having occurred among the natives.'

'You mean by the application of the snake-stones ?' suggested the Judge.

'Yes ; I have certainly heard of some apparently well-authenticated cases of cures having been effected by them ; but never having witnessed one, I cannot say what amount of reliance may be placed on such statements.'

'Snake-stones—what are they ? Where are they found ?' inquired one or two of the listeners around.

'They are manufactured in various places,' said

the doctor ; 'and I have seen them, though I never happened to see them employed. Their native name is Pamboo-kaloo ; and they are small dark substances, very light and porous in texture, their power of absorption being very remarkable. In calling them stones we merely use the customary expression, for they are not really stones, but are in reality small pieces of charred bone.'

'Do the natives carry them about as charms, or how do they apply them ?' asked a young assistant-surgeon, who had been listening very attentively.

'They do not seem to have any power of averting snake-bites, so are not considered as charms in the ordinary sense,' replied Dr Beamish. 'When a native has been bitten, and a snake-stone is at hand, the limb is bandaged very tightly above the place, and the stone is applied to the wound, to which it at first adheres closely, and then drops off of its own accord. It has then apparently drawn out all the poison, and the patient is supposed to be cured. This at least is what I have been told ; but the efficacy of the so-called cure is quite another matter.'

'It is what I have often been told too,' observed the Judge ; 'and I remember seeing a man in my district who was said to have been bitten by a cobra, and had been cured by the application of one of these so-called stones. But I am inclined to think there is a good deal of chance in the matter. Perfect faith in the virtue of the stone may go a long way in assisting the cure ; and of course we only hear of the successful cases, never of the failures.'

'That is true,' replied the doctor ; 'and there is besides no special quality in the 'stone' itself that can be ascertained, for they have been frequently subjected to very careful analysis, and as I said, have turned out to be nothing more mysterious than a piece of charred bone, afterwards shaped and polished. At least that is all we can tell about them ; and they certainly hold no place among the remedies employed by medical men.'

'In fact, doctor, there is no remedy for the bite of a snake so good as keeping out of its way ; prevention better than cure, eh ?' remarked a cheery old merchant, on his way back to the North-west Provinces.

'No doubt of that, Mr Roberts ; but unluckily we can't always manage to keep out of the way of snakes ; I only wish we could. Why, I could tell you a dozen instances of their being found in the most unlikely places, and of several most providential escapes from being bitten. A brother-officer of mine, who was with his regiment on the line of march, slept every night on a low *charpoy* or camp-bed in a corner of his tent, which was curtained round, but of course rather loose in its construction. His servant's entrance one morning disturbed a snake, which rapidly slipped from the bed, and made off through an aperture in the tent. Another servant on the outside perceived it, and killed it instantly by a blow from a switch which he chanced to have in his hand. It proved to be a cobra, three and a half feet long ; and my friend's thankfulness for his escape may be imagined when he discovered on an examination of his bed that the deadly reptile had been lying coiled up within a few inches of his head, the round indentation on the pillow being plainly visible ; while he recollected

having felt a slight sensation of movement once or twice, which luckily for himself he had been too drowsy to notice further.'

'Come now, doctor! is that a fact?' said old Mr Roberts, shaking his head doubtfully. 'They say misfortune makes us acquainted with strange bed-fellows, but a cobra would stagger most people.'

'It's a fact all the same,' rejoined the doctor, oracularly. 'Bless you! if that surprises you, I'll tell you one or two more; and then I'll call on the Judge, who I know has *one* at least of a nature to make your hair curl, for I've heard him tell it. Well then, I was assisting once at a *burra-khana* or big dinner-party, and we had all been extremely vivacious. At last the ladies rose to depart; when just past the muslin skirts of a very pretty girl who had been my right-hand neighbour, there glided a cobra, which forthwith made for the open window behind us; but was attacked and killed before it could escape. The young lady, not unnaturally, got rather hysterical; but she soon came round, and then told us what, considering all the circumstances there was not the slightest reason to disbelieve, that during the progress of the dinner her foot had on several different occasions touched a soft object, which once or twice moved slightly, but which she concluded to be a pet dog belonging to the master of the house, which she knew to be perfectly quiet and good-tempered. The dog, however, had not been in the room at all; and the object she had touched had undoubtedly been the coiled-up snake, whose bite would have been speedily fatal to the poor girl, who little guessed the awful risk she had so narrowly escaped.'

Various ejaculations followed this anecdote. 'Now really, doctor!' from Mr Roberts.

'Solemn fact, my dear sir,' replied Dr Beamish. 'I saw the thing happen with my own eyes, and by no means omitted to reflect that the young lady sat next to me, and the calf of my leg was not far off, and might have come handy, as an Irishman would say.'

'Now for one other anecdote, and then perhaps the Judge will kindly follow suit. One of our sergeants' wives had a little boy of about a year old. The child was asleep one day in a wicker cradle, over which his mother had spread a light chintz quilt, to protect the infant from the flies. She was engaged in some household matters in the next room, quite assured of the boy's safety, as she was close at hand, and could hear his slightest movement. Some cause or other took her into the apartment where the child lay; and glancing at the cradle, she beheld a terrible sight. The infant lay in a deep and tranquil slumber; but at the foot of the cradle, coiled up on the quilt, was a snake, which the least motion of the child might at any moment disturb and irritate, when the most frightful result would probably follow. Knowing herself to be powerless for good, the poor mother cast an agonised look on her sleeping babe, and with trembling limbs slipped from the room and rushed to the place where she knew she should find her husband. In a moment he had decided what to do; and seizing some implement with a forked extremity, he followed his wife back to the house. Stepping softly up to the cradle, with one swift movement he dexterously twitched the deadly reptile from the spot where it lay, and with a well-aimed blow killed it on the ground

where it fell. Nothing like presence of mind on such occasions; no time for deliberation with cobras. Now I think I have pretty well done my share of the talking, and harrowed your feelings up to the proper pitch for the Judge's story.'

The worthy Judge thus appealed to, cleared his throat, and looking round the group, which had by this time become considerably larger than at first, he observed with a smile: 'Upon my word, we look for all the world like a circle of natives listening to one of their story-tellers. I don't know that I feel up to the subject; the doctor has taken me quite at a disadvantage. Men with his powers of narration should have mercy on their less highly gifted neighbours. I am sure you can tell the story far better yourself, doctor.'

'Time about is fair-play, Judge,' replied the doctor jocosely. 'You were an eye-witness; I was not.'

'Well, well,' said the Judge; 'I suppose I must try. Once upon a time then—to begin like the old fairy tales—I was a smart young fellow, like a good many of you here; and I was lucky enough to obtain a Civil appointment, which was a very good thing in those days, and isn't a bad thing now, let me tell you. My father had an old friend, a civilian, who lived in Bombay; and when I landed, I found a very cordial invitation awaiting me to go to this gentleman's house, and stay as long as suited my convenience. A most worthy, kind, and hospitable old gentleman he was; nobody could have been a more sincere friend; he would have gone miles to do any one he liked a service. He had one special fault however, or weakness we may rather call it—he was very fond of practical joking.'

'A most detestable vice, if you'll excuse bad language,' interpolated the doctor.

'It is indeed,' resumed the Judge; 'and I trust none of our young friends here will ever be guilty of it, for it is neither clever nor gentlemanly. My friend Mr Gordon was a gentleman however; but in those days more latitude in manners was permitted; such things would not be tolerated now. In addition to various foolish little tricks which Mr Gordon was fond of playing off upon his guests, especially upon the "grills," he had one favourite joke, which had become a constant habit with him, so that he rarely encountered a new-comer without perpetrating it, if the opportunity offered. This was to pick up a stick, bit of matting, or rope, or anything that came handy, and throw it against the person he wished to startle, at the same time exclaiming: "A snake!" Some of them merely smiled and took no further notice; others perhaps started and looked uneasy for a moment, and this delighted the old gentleman; while a few were found who were visibly annoyed, and did not see the joke at all. It was certainly a very weak one. However, he seemed to find it entertaining, for he constantly perpetrated it, till he one day received a lesson, which undoubtedly cured him of that trick, and I think of a good many others.'

'He was walking in his compound or garden one afternoon with two or three friends. I was there too, and with me was one of the young men who had come out at the same time as myself, and who had called that day to see me, and had been hospitably invited to remain to

tiffin. He and I were strolling about by ourselves, when the course of our walk brought us close to the spot where Mr Gordon and his friends were chatting. In a moment the old gentleman stooped down to a little tuft of herbage beside him, seized what looked like a small stick or bit of branch, and flung it against my friend Mr Ashley, saying quickly: "There's a snake!" I had heard this so often now that I did not even smile, but just glanced at Ashley with a look meant to say: "Never mind; it's only his little joke!" My eye fell on his bent arm, where the object thrown by Mr Gordon had alighted; it had not fallen off, but had remained there. That moment it began to move; and with a sensation of horror, which to my dying day I can never forget, I saw the reared head and small bright eyes of a krait, one of the most poisonous snakes in India! Its bite was all but certain death, and that in a very short time. "Stand still!" I cried in an agony. "Do not stir, Ashley, as you value your life!" One glance, and the brave young fellow comprehended the situation. The snake was now slowly curling itself about his shoulder. If he shuddered, I never saw it; indeed my eyes were riveted upon the horrid spectacle, and I prayed as I had never done before, that this most terrible fate might be averted from my poor friend. Just one glance I ventured at Mr Gordon, who with his friends had turned round on hearing my exclamations, and stood silently by, still as the grave, hardly daring to breathe. The poor old gentleman was piteous to see. His face was pale as death, his eyes almost starting from his head, great drops of perspiration stood on his forehead. "Mercy! O God, mercy!" I heard him once faintly murmur.

'You must remember that all this occurred in less than a minute, in far less time than I have taken to tell it. But what an age it seemed! And if it felt so to me, what must it have been to the poor fellow who knew that his only chance was to remain perfectly still! He did so. He stood as if he were made of stone, never moving even a muscle. The snake crawled round his neck and shoulders, reared itself for a moment against his head, and again I saw its horrid glittering eyes. Once more it curled itself round his arm, and then, after a moment's pause, it glided down his leg to the ground, and rapidly made off in the direction of a hedge not far off, where we did not attempt to pursue it, being only too relieved by its disappearance. "Thank God! you're safe. Oh, thank God for it!" said Mr Gordon, rushing up to young Ashley, and seizing him warmly by the hand. "My dear young fellow, can you ever forgive me! for I never, never can forgive myself! One thing, however, I am cured. Never from this day forward shall I do such a senseless idiotic thing again—never, never!" "Perhaps it will be as well sir," replied Ashley with a faint attempt at a smile; but the next instant he fainted. The strain had been tremendous; and it was a good while before he came round. He was not ultimately the worse for his fright however, and the incident proved greatly to his advantage; for he found a staunch friend in Mr Gordon, who never forgot the peril to which he had exposed the young man, and did all in his power to assist him in his profession, of which he afterwards became a very successful and

leading member. And so ends my contribution to the evening's entertainment.' Whereupon the worthy Judge leaned back in his deck-chair with an expression of considerable relief, and waved his hand in a deprecating manner, in reply to the thanks he received from the circle who had been listening to him.

'Story-telling is like eating; it only wants a beginning,' observed Dr Beamish cheerfully. 'I knew the Judge would come nobly out of the difficulty; and I see Mr Barry there has an anecdote at the tip of his tongue. Let us have it, my dear sir, by all means.'

'Curiously enough,' said Mr Barry, 'that story of the Judge's reminded me of a case that happened many years ago in my district. I did not see the occurrence myself; but a man who did told me about it, and in fact the thing was perfectly well known. It took place at a dinner-party or social gathering of some kind. A lady sat down to the piano, and had just begun to play, when some one chanced to look at the leg of the music-stool on which she was seated, and perceived something moving there. A closer inspection shewed that the moving object was a snake, one of a most venomous species. It had been closely coiled round the spiral leg of the stool; and when the poor lady unconsciously seated herself in its vicinity, it had been disturbed, and immediately began to move. She was quickly warned of her great danger, and urged to sit perfectly still, which she very heroically did, not stirring hand or foot, or uttering a cry. It must have been a fearfully trying ordeal for the poor thing, as there was no telling what course of action the snake might pursue. However, in this case it never touched her at all; but after curling round and round the music-stool for half a minute or so, it dropped on the floor, and was killed before it could effect its escape.'

'How excessively unpleasant!' said a young fellow; one of those, like myself, new to Indian life and experiences. 'Why, the horrid reptiles seem to meet you at every turn! Is no place safe from them?'

'Don't be alarmed, my dear sir,' replied the doctor easily; 'the snakes are not so frequently encountered after all, the poisonous ones at least. And though it is unhappily the case that thousands of people, chiefly natives, lose their lives by snakes, there are at the same time numberless instances in which those who have been bitten by the less dangerous species have recovered, and in fact suffered little or no uneasiness. There are plenty of harmless snakes, but you are not sure which are which, for a time. The stories you have been hearing are what we may call "special cases."'

Among the group that had formed on the deck was an Indian chaplain, who had been listening to all that had gone on, but had not hitherto taken any active part in it.

'If you will allow me,' he now observed, 'I will tell you a very curious and melancholy incident that happened on one occasion in a church where I was conducting the service. The windows and doors were of course all wide open, and through one of those open doors a cobra glided into the church. I did not notice it myself, but several of the congregation did, and were not unreasonably much alarmed. The beadle, a native, was fortunately

on the alert ; and he managed to procure a tulwar, with which he cut off the creature's head before it had time to do any mischief. Tranquillity was restored, and the service proceeded to its close, when many of the congregation went to look at the dead snake as it lay headless on the ground. Among them was a man who, in his curiosity to examine the reptile, put his foot on the head and rolled it towards him ; when he instantly uttered a loud exclamation and drew his foot away. By some means or other, he had contrived to set in action the muscular apparatus attached to the poison-fangs, which had darted violently forward and struck him on the foot. All remedies were useless : in half an hour the poor fellow was a corpse ; proving, with a vengeance, the awful virulence of the poison of the cobra da capello !

This was our last anecdote. It was getting late, darkness was setting in, and it was about the time when the Judge, the doctor, and some of the others were in the habit of turning in for a nightly rubber of whist. An adjournment was made therefore by most of the party to the cabin, Dr Beamish bringing up the rear with the chaplain.

'Very curious incident that you have just related, Mr Lane,' I heard him say, as he descended the stairs ; 'I must really make a note of it.'

'Yes,' calmly replied the chaplain, 'but nevertheless terribly true.'

[Our readers will be startled to learn that according to a return published in January 1878, no fewer than twenty-two thousand human beings lost their lives in India during the previous year, by snake-bites ! This lamentable sacrifice of life is occasioned not only by the cobra and krait, but by other deadly species, and notably by a snake, barely a foot long, the *Echis carinata*, known also by the name of Kupper or Foorisa.

The effects produced by snake-bite vary according to the species. Thus, the bite of the cobra produces coma and speedy death, whereas the poison of others, such as Russell's viper, produces excessive pain, convulsions, and usually death. The bite of *Echis carinata* causes blood to ooze from the pores of the victim, who, after lingering for a week or more, succumbs to the fatal poison.

The number of harmless snakes is enormously in excess of the venomous species, else the mortality would unquestionably be greater even than it is ; and it is to be deplored that more strenuous measures are not taken to eradicate, as far as possible, a tribe of animals so deadly to man.—ED.]

THE TWO SEXES.

THE following pointed observations, which appear in the *American Socialist*, may be quoted in confirmation of the views we have propounded in the article Fashionable Vagaries, in a recent number of the *Journal*.

'As to the question of the sexes, I think that woman's love of dress is the stamp of her inferiority. It ends the discussion with me. I can't respect my sex as I do the other while we are such creatures of dress. Here a man and his wife are projecting a journey. The man is equipped in an hour, and his attention is free for the higher considerations of the occasion ; but the woman must have a week for her preparations,

and starts off fagged out with shopping, and dress-making, and packing. Go to Wilhelmj's concert. The gentlemen performers are not distinguished at all by their dress, unless it is by its simplicity. Wilhelmj's black coat is buttoned across his breast up to his collar, and his wristbands are quite inconspicuous. But the lady singer comes in dragging a peacock's tail unspreed, and tattooed from head to foot with colours, and frills, and embroidery. What is a wedding to a woman ? It is a bride's satins, and laces, and jewels. The sentiment of the circumstance is all smothered in dress. She can neither feel solemn nor gay—she is a spectacle of clothes. You bring me Scripture for her relief : "Can a maid forget her ornament, or a bride her attire !" I don't say she can any more than a leopard can change his spots ; I only say it is something which stamps her inferiority.

'If you quote revelation, I will quote nature. According to nature, man should be apparelled in brighter colours and with more fanciful decoration than woman, and should think more of his appearance. See the peacock, and gobbler, and rooster, and the male birds generally. The lion cultivates a flowing mane, but the lioness wears her hair as meek as a Methodist. The human female seems to have lost her natural prestige, and is fain to make herself attractive in meretricious ways.

'Imagine a man compressing his ribs with stays, or trammelling his legs with skirts ; let alone swathing them after the mummy fashion of to-day. Imagine him spending an hour every morning in fixing his hair for a day-long torment. He will have his dress subservient to health and comfort, and freedom of breath and motion. You say he is in bondage to the changes of fashion as much as the women are. But he contrives to keep these conditions intact. His new styles are not allowed to intrench on his comfort and health, and the higher interests of life. If he changes the cut of his hair, he still keeps the sweetness and unconsciousness of short locks ; he does not let them grow inconveniently long, or canker his head with a frowsy chignon. If he changes the fashion of his coat, it is almost unnoticeable, and you may be sure it is at no sacrifice of ease. His pantaloons may be cut a little more baggy or a little more statuesque, but never with trails or any impediment to his natural gait. His hat is always the same serviceable sun-shade, and his cap the same protection from the weather, no matter what the details of style.

'Well, you say that the women dress to please the men, and if women are foolish, men make them so. My answer to that is, that men are as fond of pleasing women as women are of pleasing men, and more so ; but they have wit enough to accomplish their object without the monstrous sacrifices women make. Whether any amount of education and opportunity will give women this wit, or diminish the advantage man has gained, remains to be seen.'

CHAMBERS'S JOURNAL

OF
POPULAR

LITERATURE, SCIENCE, AND ART.

Fourth Series

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 818.

SATURDAY, AUGUST 30, 1879.

PRICE 1½d.

THE FIRST OF SEPTEMBER.

BY AN OLD SPORTSMAN.

Two feasts in the sportsman's year are already past. The richer part of the sporting community have had nearly three weeks' recreation among the grouse. Knee-deep in purple heather, or surrounded by lichen-grown boulders and babbling mountain streams, they have revelled in the pure fresh air of hill-side and plain.

After the 12th August, the next red-letter day which concerns the sportsman is the date which stands at the head of this paper, on which day, in England at all events, partridge-shooting commences. 'What about the birds?' is the question that has been anxiously asked by one sportsman of another all through this exceptionally wet summer. The rain we had during the time when the all-important operation of hatching out was taking place must have caused considerable anxiety to those who rely upon the plump gray bird for their season's sport. However strong and numerous the youngsters may be when hatched, continued wet weather is sure to be fatal to many of them. In a rainy time, insects are scarce, and many a weary round does the fond bird-mother go with her brood trailing after her, gradually getting draggled and wet and cold as they toil through the drenched corn or over the sodden soil. One by one they drop behind and die; while the old bird—whose instinct, although it supplies her with many a stratagem to draw off an intruder from her as yet helpless progeny, does not teach her the art of counting—continues her watchful care over the survivors, happily unconscious of any falling off in the number of her brood. Many a promising season is spoiled by the rain; and yet of course showers are very necessary, as without rain the root-crop is a failure; and in many places sportsmen are dependent on a good crop of mangold or swedes or turnips as covert for the birds when the time for shooting them arrives. Some savants say that the rain that is necessary to secure a good root-crop will

be pretty sure to play havoc with the birds. Be this as it may—plenty of birds without plenty of covert is almost if not quite as bad as the other alternative. One way of making a bag when there is no covert is by 'driving' the birds and shooting them as they pass; but it is a well-known fact that driving spoils the future shooting on any but very extensive beats. I have heard of good bags being made when covert is scarce, by means of an artificial kite shaped to represent a hawk; but somehow, I cannot reconcile this with ideas of true sport.

The First of September is *the* day for English sportsmen; and what a host of recollections it calls up to the mind of a veteran gunner of some fifty years' standing! How pleasant it is to stroll round the fields with such a one on the evening before the First, and hear him sing the praises of what he is sure to term 'the good old times!' How enjoyable are his tales anent the shooting capabilities of the veritable flint-locked 'Joe Manton,' that hangs on the rack in solitary grandeur in the study at home! How refreshing are his stories relating to a celebrated strain of pointers that have been for generations in the family! How 'Don' one day jumping over a stile winded some birds, and halted as if paralysed as he alighted on the ground, afraid to move for fear of disturbing them. How 'Major' the old water-spaniel flushed a couple of ducks in the beck yonder, which fell to the Manton mentioned above, but were both of them only winged; and the old man's eye lights up as he tells how 'Major,' who had never been known to hurt a bird before, and who never did afterwards, when he had tried in vain to carry both at once, came to the conclusion that it could not be done. How 'Major,' after due deliberation, carefully killed one bird and put it down upon the bank, while he swam over the beck with the live one, and after delivering it safe and sound to his master, went back, without being told, for the other one he had left behind. And the old man chuckles with delight when he adds: 'Ah, my boy! you don't get dogs like old "Major" nowadays.'

Pointers are almost done away with for partridge-shooting, and retrievers substituted; these, however, have to be led by keepers, to prevent their spoiling sport. Indeed, it is quite a question whether shooting as it is often now practised can be called sport. The introduction of breech-loaders has changed everything. On large manors, guns enough to fill a field come together; a line is formed, and quick march! is the order of the day. If a bird is winged, a retriever is slipped for a few moments, and if he finds it immediately, well and good; but if not, the whole line, with the exception perhaps of the man who winged the bird, is impatient to be off again; and 'Rover,' as soon as he can be caught—which is often a matter of time and difficulty—is taken in hand by his keeper, and the bird is left, badly wounded it may be, to die by inches.

I for one, should like to have a day in the style of 'fifty years ago,' when two guns—flint locks of course—were considered ample; with pointers which retrieved, and in fact did everything but speak, and which, moreover, were broken as well as bred by the sportsman himself. A leisurely comfortable walk, with no keeper to bother you, but a cheery companion of the Izaak Walton sort, who could interweave timely and genial conversation with the shooting, and who above all things knew when to hold his tongue. How pleasant to be received with a cheery welcome by old-fashioned farmers, their equally old-fashioned wives, and their comely, healthy-looking daughters; to leave them a brace, and to taste their sparkling cider, meeting with nothing but smiles of welcome and hearty good-wishes for your sport everywhere!

Too often nowadays the farmers, if they get any game at all from the people who shoot over their land, must be satisfied if an officious keeper—to lighten his own load perhaps, or to get something to drink—suggests that Mr So-and-so would like a hare; though I am bound to confess there are many notable exceptions to this unworthy plan. It really does seem hard that a farmer, on whose corn the birds have fed all their lives, and who has in a measure preserved them all through the year, and so in reality supplied the game—it does seem hard, I say, that the farmer not only may not shoot a brace for himself, but too often does not even get any given him by the shooter who tramps over his land, scares his stock, breaks his fences, and invariably finds fault at the close of the day if the bag is not big enough to satisfy his inordinate rapacity. September is now here. Once again the fields will ring again, and the woods around will echo and re-echo with shots fired in stubble and root, in hedgerow and clover. The annual slaughter of the genus *perdix* will have begun, and the momentous—to sportsmen at all events—question, 'How about the birds?' will in many instances have been answered practically.

I would recommend intending shooters in the early part of the season not to shirk their work, but to look their land very thoroughly. More birds are passed over by cutting off corners, taking wide sweeps, and leaving the stubbles unsearched, than many people are aware of. A small quantity of ground thoroughly beaten is sure to afford more sport than a large number of acres merely scrambled over—provided of course the birds are there. Many a sportsman leaves off after a long

day's shooting dissatisfied with himself, his dogs, his keepers, his sport, and his bag, solely because he imagined that the way to have plenty of sport was to walk hastily through the best pieces of covert, entirely disregarding little bits of rough meadows, grassy banks overgrown with thistles and rough herbage; and above all, the shady corners of fields during the heat of the day. Straight powder, an even temper, jolly companions, and a healthy mind in a healthy body, are all necessary for thorough and successful enjoyment of either the best or the worst sport that one's shooting can afford.

The evening of the First is by no means the least enjoyable part of the day. Many a sportsman whose eye is getting dim, and whose silvery locks display traces of Time's wanton fingers, can look back, perhaps, to some September evening long, long ago in the dim vista of the past, and call to mind the close of a certain never-to-be-forgotten day's shooting, when, as he was sauntering about the lawn, watching the full harvest-moon rise so softly and so gently above the trees in all its splendour, he was emboldened by the still loveliness of the evening and the charming natural repose of things around him, to say a few words that rendered him happy for life.

And now his son, perchance being in the same fond predicament, hangs on his father's lips—to use a classical expression—as the old man relates his past September memories; and steals sheepish glances at a sister's friend who happens to be staying at the Hall. And then on the same lawn, and near the identical spot perhaps,

In her ear he whispers gaily:
'If my heart by signs can tell,
Maiden, I have watched thee daily,
And I think thou lov'st me well.'

While his fair companion also sore smitten—

Replies in accents fainter:
'There is none I love like thee!'

Man is an imitative animal; and the advice I give to young sportsmen who wish to render this September the happiest in their lives, is to follow the example mentioned above. Tennyson is a first-rate poet to grow sentimental over, and when assisted by Nature in the shape of a lovely September evening, he is perfectly irresistible. *Esperanto crude.*

YOUNG LORD PENRITH.

CHAPTER I.—THE MILL OF DEATH.

RAIN, rain, and always rain, ever and always. It rained in Cornwall as if it had never rained before, fiercely, incessantly, as if of storm and evil weather there should be no end. It is, no doubt, quite a mistaken impression on the popular mind which attributes eternal rain, as one of its abiding features, to the ancient realm of King Mark the Luckless. There are bright sunny days on that rock-cradled promontory, when the coy scent of the golden gorse-flower mingles with the perfume of the shy myrtle, and when Cornwall seems dry enough. But when it rains, the Cornish rain is very real, pitiless, and persistent, and so it was just then; while in Dorsetshire and Hamp-

shire the light hoar-frost of winter was silvering the grass blades.

But if the rain that beat against the window-panes of old Captain Job Trawl, sick now, and bedridden, in the low-lying outskirts of Treport, was heavy and continual, fiercer still was its beating upon the slated roof of the Mawth Mill, and on the lofty table-land of which the Mawth Mill occupied the highest angle. High above, at the head of the glen, loomed aloft, over the ruined castle of the Montmorts, and over the Mill that had been an engine of their tyranny, the shapeless ungainly mass of the one mountain in the district, grim and gaunt Pen Mawth, where the rocks cropped barely out from the thin soil.

The Mill could work no more. The great wheel, with its weighty float-boards, was chained up now, and protected, so far as was possible, against the fury of the downward current, by boardings of stout timber hurriedly put up; while every sluice and flood-gate had been opened to the fullest pitch, to let the rushing torrent go free into the lower stream that brawled on towards Tregunnow. The men in the employment of the Black Miller came up still from their hamlet in the dell, timidly to take the orders of their brute master, as once their forefathers had crept to the Norman baron's gate to learn the pleasure of the feudal lord who had his hired horsemen in leash, ready to let slip, like bloodhounds, against those who angered him.

Ralph Swart, in these latter days, appeared more self-willed and more morose than ever he had been before. He drank deeply, in solitude, as it was his nature to drink; and on the few occasions on which he appeared in public, his dusky face was empurpled by the effects of strong liquor, and his speech thicker than usual, if equally decided and imperious.

'Word and blow, Master Swart's worse than custom is!' said the much-enduring peasants who had to deal with the terror of the countryside, and whose habitual turn of mind was quite unlike that of the bolder and bluffer population of the coast. Jan Pennant, the fisherman, would not have cowered before even Ralph Swart as he did before his terrible creditor, the Jowder, frail, physically, but armed cap-a-pie in the strong armour of money.

Yes, it raged, the rushing stream that had its birth on the crest of heath-clad, shapeless Pen Mawth, and gurgled through the deep ravine, burst out, brattling over the stones in the rolling upland beyond, and then swirled on past the rocky platform on which stood Tregunnow Church-town. The low-lying meadows, between that ugly water-shed and the coast, had been swamped for weeks past. Boats, had there been any boats, would have supplied the best means of communication between some of the inland villages. Cattle had been drowned, bridges washed from their piers, sheep had perished helplessly, and ricks had been floated off, and still the rain fell. It was a wetter winter than any Yule-tide of all the years since Ralph Swart had been the tenant of the Mawth Mill. Little recked the Black Miller of the rain. If he remembered it, it was with anathemas against the stoppage of his mill, and the cost which the repairs entailed on him. No reasonable precaution did he neglect; but the men who worked for him—hired from Tregunnow and other

places near—plied saw and adze, and hammer and spike-nail, and spade and pick, as they would never have plied them for my lord or Sir John, with all the liberal flow of ale from the Hall's buttery-hatch to stimulate their efforts. And they would turn to and fro in their horny palms the money Ralph Swart paid them, and breathe on it for luck, and feel uncomfortable as they thrust it in their pockets at last.

What cared the Black Miller for rain or lowering skies! The storms that lashed his house, and raged about his glen, and stripped the thin coating of peat from the slippery stones of the hill above, were to him sources of trifling annoyance. What really seemed to preoccupy Ralph Swart was the non-arrival of some letter which surely ought to have reached him ere this, and in quest of which he visited Tregunnow so often and so scowlingly, that the timid post-mistress, as she looked up from her sorting, to say, 'Nothing to-day, Mr Swart,' felt it as a relief when the retiring tramp of heavy boots told that the man had withdrawn his big presence from the narrow office. He was much in Tregunnow, just then, was Ralph Swart, always in public-houses, drinking deep, but convivial never; and either a stealthy listener to other men's talk, or engaged in the perusal of the beer-stained and dog's-eared country newspapers that littered the tables of bar and taproom.

It roared, the stream, as it came down, flinging high the sudden jets of wild fountains into the air, as the rushing water spouted forth from among the boulders that blocked its course, climbing farther and farther up the rocky gorge, sending heaps of white froth across the black depths of the mill-dam, and encroaching hourly on croft and pasture, as the sea, in some counties, wins roods and acres from the land. Higher up than the mill, far up the humpbacked height of dark and shapeless Pen Mawth, the few hinds who earned their bread by toiling there whispered one to another, as they trudged back from their work, or at the doors of the red-brick Shiloh or Ebenezer that they attended for the sake of stinging sermons, hymn-singing, and spiritual excitement, how very bad things looked. Nathan's field of oats was a part of the swamp now, and had moved off, bodily, with the moving peat and turbid water. Farmer Bloss had lost two stacks, sucked down by the quagmire that had swallowed half a score of strayed sheep on Monday last. There was more mud than Swedish turnips on Mr Dean's ten-acre patch. The black tarn at the top of the hill was seething as if a mighty fire burned below, and the foam and foul bubbles overflowed even to the naked stones and furze beyond.

In the hamlet that sheltered the handful of adult labouring men, descendants of those whom the Montmorts had conquered and enslaved so long ago, who yet clung to the old place, and yet earned a frugal livelihood from the barren soil, there was much doubt as to whether Ralph Swart the Miller 'ought to be told' of the danger he ran in obstinately holding on to perhaps the most exposed position for miles around. The women were for leaving the 'foreigner,' who had been a quarter of a century resident there, to shift for himself. Ralph Swart's manners were not calculated to endear him to the gentler sex. But the men had less easy consciences, and after much growling over the tobacco-pipes, a sort of gruff remonstrance was

made with the Black Miller on the score of his persistent solitary residence in the flooded glen in such weather.

Ralph Swart was not drunk—he was never that—but inflamed and quarrelsome with drink when the deputation reached him, towards sundown. It was long remembered how the Black Miller had stood on his door-step with the orange gleam of the setting sun falling in unwholesome lustre on his swarthy face and harsh lineaments, as he railed at the officious cowardice of those who came to utter a reluctant word of well-meant warning.

'Pack of meddlers!' he had said savagely, 'pack of croaking crows! Be off, fools! and may your black tarn smother your own thick skulls and lazy bodies—ye whey-faced curs! Take that for your pains, neighbours!' And with that he slammed the door, and drew bolt, and set bar, regardless of wailing wind and beating rain, as he was of the well-intended advice of those who dwelt near him.

That night every inhabitant of Mawth hamlet was awakened by a roar and a crash, as though the great sea itself, bursting its barriers, had made its resistless way inland. There was rattling of loose rocks, and the crash and fall of masonry, and the snapping of tree-trunks too weak to bear the pressure laid on them. And amidst the fiendish uproar and tumult, amidst shrieking wind and lashing rain, and the roar of the triumphant water, arose a frightened voice that cried aloud how the black tarn on Pen Mawth, swollen long, had burst for the second time in eight hundred years, and filled the glen, and how Mill and Miller, and all that drew the breath of life within that desolate ravine, had perished in the darkness, amidst the inundation that had swept down, pitiless, from the mountain-side!

CHAPTER LI.—RALPH SWART'S HEIRESS.

Day had dawned, and the red streaks in the sky had changed, slowly, into the reluctant light of a stormy winter morning, as a party of wayfarers, coming up from Tregunnow, approached the ravine in which the Mawth Mill was built. Some of them wore police helmets and police uniforms, others were in the garb of ordinary life. That stalwart form in front can belong to no other than Hugh—so long called Ashton in these pages—while beside him is Mr Dicker, whom even his London engagements and world-wide business have not prevented from being present on this occasion; and at the capitalist's elbow walks a stout-built, pleasant-visaged man, the first sight of whose well-fed face suggests visions of oil-cake, root-crops, and gold medals vigorously competed for at the Agricultural Hall in Islington, but who probably knows nothing of beef until it reaches the butcher's shop-front and the kitchen; being no other than Sergeant Brow of the Detectives, a ministering sprite from Scotland Yard, whose services Mr Dicker has had reason to appreciate before to-day.

It was windy and gusty yet. The rain that still fell was but puny rain, like the dropping fire of skirmishers that sometimes succeeds the thunder-crash of a general action, and the furious torrent that had wrought such mischief in the night had had time to shrink to more moderate dimensions.

But, even at Tregunnow, cellars and basements had been filled, and gardens choked with peat and mud washed down from the mountain-side; while rumour, which deals ever in the superlative, had represented the exposed Mill of Pen Mawth as having not one stone left standing upon another.

'I fear he has escaped us,' said Hugh, more in sorrow than in anger, as he and his companions passed on, catching at intervals a glimpse of the turbid flood rushing so hurriedly down in its tumultuous passage towards the sea. That one so wily and alert as Ralph Swart had actually perished by drowning had not seemed probable, either to the Cornish county police, to the experienced detective from London, or to Hugh and his friend Mr Dicker. To them, the storm of the previous night presented itself rather in the light of an untoward accident, likely to have given the alarm to the formidable occupant of the Mill of Death, and to have caused him to be elsewhere than at home when the domiciliary visit of the police should be paid. Warrants, as promised by Sir Henry Marsden, had been duly issued, authorising the arrest of James Grewler, otherwise Ralph Swart, and as formally indorsed by justices of the peace for the county of Cornwall. And there was Sampson Brow, sergeant in the Detective branch of the Force, of which Scotland Yard forms the headquarters, ready to lend the aid of his valuable advice, should the local officers be at fault. But for all that, there were few hopes of a successful result.

'I'm afraid you're right, my lord! We shall find the bird flown,' said the sergeant, touching his hat.

Presently, turning an angle of the rocky road, the party of seekers from Tregunnow became aware that they were not the only ones whom curiosity or interest had caused to be early abroad. Numbers of the country-people had collected in the lower part of the ravine, still encumbered by torn-up trees, and bushes uprooted, and turf, and rocks, rolled down the hill-side by the resistless force of the now subsiding torrent. One group had gathered around the half-submerged carcass of a dead horse that lay across a tongue of land projecting itself into the stream. The poor brute had evidently struggled hard to gain the bank.

'It is the Black Miller's horse,' said one of the labourers.

'Are you sure of that?' asked the Inspector of the county police.

'Quite sure, master,' was the answer. 'See! there be some of the woodwork of the shed that was used for a stable, and there's the broken halter still.'

A little farther on, and the Mawth Mill itself was in sight. Popular rumour, in reporting its destruction, had erred, as usual, on the side of exaggeration. There had been much damage done. The out-buildings had been washed away. The mill-dam had been demolished. The shattered fragments of the great wheel might be seen mingled with brushwood and rubbish at the edge of the stream. But the strong masonry had stood sturdily against the rush of the black flood, and the walls remained unbreached. There was a deep pool of foam-flecked water around the dwelling-house, and it was necessary to wade, before the door, still fast closed, could be reached. Near the house itself the gazers had gathered thickest,

and among them was a spare elderly gentleman in clerical attire, who seemed to be giving orders to the rest.

'Our vicar, gentlemen, from Tregunnow—Mr Mulgrave,' whispered the local Inspector of police; and then he approached the clergyman and said something in a low voice. The vicar started, turned round, and courteously raised his hat.

'You are here, gentlemen, as I understand, on business,' said the clergyman; 'so am I, for mine is a large parish, and Mawth Hamlet and Mawth Mill are included in it. But I am afraid we shall find no one living here. Swart the Miller is either absent, or he has perished. We have knocked repeatedly, without any answer being returned. And I was just telling the men that they had better force the door.'

'We have authority to make an entry in any case,' replied Mr Dicker. 'This man Swart is charged with wilful murder; and our errand here is to bring him to justice for a crime committed five-and-twenty years ago.'

There was a stir and a murmur among the crowd; but if there was some excitement, there was no astonishment. All seemed prepared to hear the worst of the Black Miller that could be heard. Meanwhile preparations were being made for bursting open the door. A beam had been brought, and slung as a rude sort of battering-ram, from the shoulders of several men. The first shock awakened the sullen echoes of the dark uninviting house; but the door resisted. A second and more vigorous thrust, and it gave way; while forth through the aperture poured a fresh torrent of turbid water, and it was not until some minutes had elapsed that the house could be entered.

'There he be—there be Master Swart!' exclaimed a dozen voices at once. Yes; he was there, the man they sought, the secret assassin who had cheated justice so long. He lay there, fully dressed, his dead face upturned, his right arm and hand extended, as if in the attempt to undo the fastenings of the door, and escape, surprised as he had been by the flood of angry water that had broken in at the back of the house, and which had filled the lower rooms almost to the beams of the ceiling. There he lay, grim and threatening of aspect to the last, not unpunished, though no clerk of assize was to record, for Doom, the sentence pronounced on James Grewler. And Hugh looked down on his bitter enemy, unseen before, with a sort of awe, as men do when earthly revenge is baffled by the interposition of a higher power than theirs.

'Vengeance is the Lord's!' said the clergyman, breaking the silence that ensued.

Up-stairs were found ample proofs of Swart's or Grewler's guilt, proofs sufficient, had they been produced in court, to have given his neck over to the hangman, even without the additional evidence at the command of the Crown. There were letters proving the motive which had led to the commission of the murder so long ago. Marmaduke Beville had detected, or fancied he had detected, something wrong in the steward's accounts, and, without mentioning to his father the suspicions he had formed as to Grewler's dishonesty, had repeatedly threatened the dishonest steward with dismissal and disgrace.

'Threatened men live long,' was Grewler's cynical comment, in the form of a marginal note

on Marmaduke Beville's letter. To murder the eldest son of his deceived employer, and artfully to throw the blame of the murder on the second, had been James Grewler's counterplot. To this end he had purloined the pistol; while the gun, a present from Lord Penrith, with which the deed was done, was found in the murderer's bedroom at the Mill.

A careful search, in executing which there was no lack of volunteers, led to the discovery, in a secret cupboard, of an iron safe containing a great sum of money in notes and gold, in silver, and even in copper coin. The Black Miller's hoard amounted to almost fourteen thousand pounds; the larger portion of which no doubt consisted of the funds embezzled while Grewler was steward at Alfringham, and to which, as Mr Dicker whispered, Hugh had a legal claim.

'I shall make no claim,' answered Hugh.

At that moment there rose up from below a babble and outcry of shrill female voices, as, in the midst of a knot of gesticulating women, there drew near the house the thin and bending form of a young girl, travel-stained, weary, and haggard, yet decently attired, and with a modest, shrinking air, which matched well with the sickly aspect of the pinched face and wistful eyes.

'It's herself, it's poor Jane Swart—the Miller's daughter—her he drove away, the Lord forgive him! come back now, on such a day as this!' cried the excited women.

Yes; it was Jane Swart, the young daughter whom, five years ago, the Black Miller in his drunken fury had driven out into the world, bidding her starve or steal, for he would bear with her whimpering voice and whey-faced looks no more. The poor thing had earned what was called her living—dying by inches would have been a truer term—by plying her needle sixteen hours a day for bare bread and decent lodging beneath the roof of a seamstress at Falmouth, who found it all too hard to maintain herself and her children to be over-tender with the young women who worked under her orders. And now that consumption had set its seal on her, and that her weary eyes could see the thread no more, she had perforce wandered back, saying, simply: 'Let my father kill me if he will—as I have seen him kill many a dumb thing—but he is my father, and I have nowhere else to go.'

All pitied her. Most of those who saw her remembered her. The vicar told her to be of good cheer. Her father was dead, it was true, but she was among friends, and would be poor no longer. He would himself provide her with a comfortable lodging among kind people at Tregunnow. A few formalities complied with, and she would be rich. She was heiress to fourteen thousand pounds.

'I shall not live long enough to enjoy them,' said the girl, with a wan smile, and her hacking cough and lustreless eye told that she had spoken truly. The evil that the Black Miller had done lived after him.

CHAPTER THE LAST.—YOUNG LORD PENRITH.

With all the state and splendour and ceremony that became his rank, the aged Lord Penrith was borne to the tomb. And then indeed Alfringham knew a new master. Hugh offered his house, for a while, to Mrs Stanhope, who was reluctant to

quit her home of many years' date; but Maud prevailed, and she and her mother went to reside, quietly enough, in the Isle of Wight, until the day should come when Maud—Maud Stanhope no more, should recross the threshold of Alfringham as the beloved bride of its young lord. The day came, six months later; but the wedding, which took place in the little church of Alfringham village, was not a very gay or sumptuous one, on account of respect due to the old grandsire, whose word, but a little while before, had been law at Alfringham and for many a mile around.

The first and only visit which young Lord and Lady Penrith—Hugh and Maud—paid after their return to England from the bridal tour that custom renders necessary, was to Llosthuel Court. And while guests of the hospitable Dowager, it scarcely needs to be said how the Lord and Lady of Alfringham went to visit Rose—Rose Trawl no more—but Will Farleigh's happy, pretty wife; for this young couple had been wedded, by particular desire, on the same day as that which witnessed the union of Hugh and Maud Stanhope. Rose and her brisk young husband had not, thanks to Hugh's gratitude for kind services so opportunely rendered, to plunge into matrimony with no surer prospects than those which were based on the uncertain gains of a bird-hunter. An income, handsome in the eyes of the two young people, had been secured to them from their wedding-day; but it was not until the green leaves of another autumn had turned to red and brown, that old Captain Job Trawl died, and that Maud's husband, at Maud's wish, willingly placed Will Farleigh in a snug farm, within a mile or two of Alfringham, and persuaded the Cornish couple to transfer their household deities to Dorsetshire, where they have thriven. Nezer, the dwarf, with some regrets, was induced to expatriate himself also from the sight and smell of the sea; and Neptune's honest bark is yet heard on the farm, where Rose Farleigh's children tell their tiny playfellows from the Hall what good service the brave dog did, at 'my lord's' side, in a Cornish shipwreck years ago.

Mr Dicker always remained Hugh's truest and most valued friend, and in the maelstrom of his ever increasing business, finds time annually to pass some happy days at Alfringham. The money which he owed to Hugh's dead father has been expended, at Lord Penrith's wish, in establishing fresh lifeboats at Treport and St Mary's Bay. Another benefaction, of a less useful character, it may be, shortly after the catastrophe of the Mawth Mill, accrued to the poor of that poverty stricken part of Cornwall in which Pen Mawth stands. Poor consumptive Jane Swart—whose name should have been Grewler—sleeps at her mother's side beneath a headstone in Tregunnow churchyard; and by her last will and testament she left her fourteen thousand pounds, the hoard of the Black Miller her father, to found certain almshouses for the benefit of the needy in Tregunnow and the parts adjacent. Ralph Swart's name and age, with a Scripture verse beneath, may be seen on a plain flat flagstone hard by the resting-places of his wife and daughter. It was not a case for eulogistic epitaphs; nor has the dismal Mill of Pen Mawth ever again been under repair.

Mrs Stanhope, who inherited money under her brother's will, lives with Lady Larpent at Llosthuel Court, and her presence is a solace to the

Dowager, who is neither so hale nor so cheerful as she used to be. Her two younger boys—Edgar, who is called Sir Edgar, and on whom the baronetcy has presumably devolved, and Willie—are good, bright boys enough, dutiful and affectionate; but they are much away, one with his regiment, and the other at the university; and Lady Larpent has never quite recovered the shock caused by the mysterious disappearance of Sir Lucius, her eldest son. Money was spent, and exertions made, we may be sure, to trace out the missing ne'er-do-well; but in vain. The people at the inn where the horse and dogcart from Llosthuel had been left knew nothing, save that the gentleman who so left them had started by the train; but it so chanced that no one in Tregunnow or Mawth had seen Sir Lucius on the fatal day of his visit to the Black Miller, and that his bones may lie undisturbed at the bottom of the abandoned mine until the Judgment-day.

One or two of the minor characters in this history have yet to be accounted for. Ghost Nan, the gipsy, yet walks the world, and it is not probable that she should have wholly relinquished her favourite camping-grounds in the vicinity of the New Forest; but from the day when she was prompted to make depositions before a magistrate of the hated Busné, the old spirit of lawlessness seems to have been revived in her wild nature; and Hugh, though he occasionally heard of her, was never again able to have sight of, or speech with, the half-crazed wanderer. Salem Jackson, who in consideration of his readiness to turn Queen's evidence, was let off with more lenity than he deserved, recrossed the Atlantic, and was last heard of as a boarder, with a twenty years' sentence to endure, in the Tombs, New York, whence, if what we hear of the severities of American prison discipline be true, he runs little chance of emerging to prey upon the honest portion of the community.

And Hugh? and Maud? Loving and beloved, they may, from the setting in of that new-born period of well-deserved prosperity which succeeded to Hugh Ashton's early struggles, be compared to those happy nations of whom no story can be told. Brighter days, indeed, than those of a stormy youth spent in adventurous exile, or in poverty at home, have dawned upon Young Lord Penrith.

THE END.

ODD PEOPLE.

'WHATEVER you do, my dear, don't be odd!' Such was the advice of a very wise old lady-friend, whose kindly face made glad many of my childish years. At the time I speak of—namely when the above advice was given—I had no very clear idea in my own mind what the word 'odd' signified. As years passed over my head, however, I discovered that this small, short, and easily spelt word meant 'particular, strange, out of the way;' and so I dreaded above all things to be thought 'odd.' The idea of becoming so, weighed incessantly on my mind, and often made me very unhappy. If in early youth a bright idea struck me and I clothed it in words, some of my companions, to whom the same idea had not presented

itself, would exclaim: 'What an odd girl!' and this was quite enough to shut my mouth, and plunge me in dismay for some time.

It may be said that every individual, unless unusually commonplace, is in some points considered 'odd' or 'queer' by his fellows. We have all hobbies, which make us, in the eyes of others, singular enough, now and then. But the people I am going to treat of were regularly oddities, and had not *one*, but *many* peculiarities. Two old Scottish maiden ladies stand forth prominently in my memory as decidedly the greatest human curiosities that could possibly be met with. Their names I shall give as Miss Kitty and Miss Wilhemina. They lived in a small cottage in one of the many small towns on the Firth of Forth. Miss Kitty was the elder. At no period of her life could she have possessed beauty, and certainly a more funny little woman never existed. Dressed in a gown whose tightness was in those days something to wonder at, her fat little body resembled nothing so much as a thick and well-filled bolster. Her features were plain even to ugliness. A large wart adorned the side of her immense nose; and a white cap of some substantial fabric, with a very high crown, covered her head, on which the hair grew luxuriantly, though in colour it was pure white. Strange to say, however, this uncouth little woman had a certain fascination of manner which made most people like her, and children were always devotedly fond of her. She had a pair of merry black eyes, which twinkled with fun when she spoke; and her anecdotes were many concerning the days of her youth, when her father, 'a gallant soldier, served King George.' A sword belonging to her deceased parent hung in the little hall of the cottage, and this she used often to take down and flourish as valiantly as her podgy arms would allow, exclaiming in a martial tone: 'Ah, my dear, if only we had a French invasion, I would prove myself a true soldier's daughter.'

Notwithstanding this exhibition of military ardour, Miss Kitty was firmly possessed with the idea that in her own person she carried every disease incidental to humanity; therefore, those who knew her well were not at all surprised to see her frequently, while talking, leap from her seat with great agility, place her hand with fantastic manner and gesture upon her chest, and declare in pathetic tones: 'It's that right lung, my love—quite gone, you know!' Or, if sitting quietly at work, she would spring up excitedly, pace the small sitting-room, and with a sort of whine declare that 'she knew her heart was becoming gradually ossified.' In talking of her possible decease, she informed her friends that she had made arrangements with her lawyer as to the disposal of her body—or shell, as she called it. The moment she died, her remains were to be handed over to the Faculty for scientific purposes, and thereafter, with no attendant ceremony, thrown over the pier of Leith! The advantages of this step, as she triumphantly pointed out to Miss Wilhemina, were twofold—firstly, no burial expenses would be incurred; secondly, the medical gentlemen of Edinburgh would be materially benefited.

Miss Wilhemina was a much less prononcée character than her sister, but was also most whimsical and curious after a fashion of her own. She had, poor lady, once on a time been engaged

to a gay young soldier, who was doubtless attracted by her golden curls and blue eyes. The marriage-day was fixed, the *trousseau* prepared; and all would have gone on well doubtless, had the bridegroom only appeared. But as he chose to be a hundred miles away on the day appointed for the marriage, the guests had to be dispersed, the dresses 'laid in lavender,' and poor Miss Wilhemina borne away fainting on the sympathising bosoms of her bridesmaids. After a long period of brain-fever and sickness, the poor creature rose once more, a very shadow of her former pretty self. The golden curls had been shorn, the blue eyes were dim with illness and weeping. And in short, as Miss Kitty said: 'Poor Mina's a mere remnant!' She never quite recovered the sad blow—a blow more to her vanity than her affections, for she had no great depth of nature; and her heart, such as it was, had been more set upon her lover's gay uniform than on any supposed good qualities in him. When, after a month or two, Miss Mina read in a paper the marriage of her 'soldier lad,' she abandoned herself to fits of angry crying, varied now and then with sullen fits of silence, which Miss Kitty endured with exemplary patience. The *trousseau* was still kept in a certain chest of drawers, which were solemnly opened twice a year, and the garments taken forth, aired, and refolded, with many a bitter sob from the hapless lady.

Miss Kitty died first. She had a certain melancholy satisfaction in the assurance that her complaints, varied and curious, had now reached a climax, and during her somewhat protracted illness vehemently combated poor Miss Mina's entreaties that she would see a clergyman, loudly protesting to the last that 'no one should pray over her,' and with almost her last breath murmuring happy prophecies concerning the substantial good to be derived from a minute study of her highly diseased 'shell.' Poor Miss Mina was perfectly inconsolable, but of course buried her sister, minus the post-mortem, and respectably, in the little country churchyard belonging to their birthplace. After Miss Kitty's death, Miss Mina was invited to a friend's house. Her spirits, at all times variable, were somewhat calmer than formerly; perhaps the real grief she felt for her sister's death had cleared away the remnants of her long-nursed and sentimental sorrow. One evening, however, she rushed from the room where her host and hostess were seated, and not appearing for some hours, they went to look for her. She was found in her bedroom, weeping bitterly. When asked what was the matter, she said: 'Oh, I did feel hurt at Mr M——'s conduct; but there has never been a real true gentleman since George IV. died!' Upon investigation, it was found that her kind-hearted host had inadvertently 'turned his back' on Miss Mina, and so had most unintentionally offended her. Not long after this, Miss Mina was found dead in her bed; and the little cottage became inhabited by strangers, neither of the ladies having had any relation.

A friend of ours was notorious for much oddity of manner; and this proceeded, we discovered, from absence of mind. He was intelligent, refined in appearance, and not ignorant of the usages of society. Yet great were his blunders both at home and abroad, simply because his thoughts

seemed always distant from the scene immediately surrounding him. Servants called him 'the odd gentleman'; and ladies used to titter as they saw him enter a drawing-room with his hat firmly planted on his head. When any one pointed out this absurdity to him, he would look like a person newly roused from sleep, and would make a hundred apologies. He was a great smoker, and once or twice lighted his pipe with bank-notes. He frequently forgot to go to bed, and used to be found by his old servant and housekeeper sitting in his parlour, with his arm-chair drawn close to the grate, in which the fire had gone out hours before. He hated children, dogs, and flowers; but shewed great benevolence to almost every other person, animal, or thing. He was passionately fond of leeks cooked in every possible way, and his garden was filled with these vegetables in all stages of growth.

A gentleman in a good position had an extraordinary fancy for cats. He had no less than sixty; these he kept in a large room which he had built for them. He would not admit any cat into this institution unless it was young, handsome, and full-grown; and as a result, some really fine specimens were to be seen in this feline chamber. It was a sight to see all the varieties at feeding-time—such a mewling, snarling, and purring went on, and such a quantity of food disappeared. After the gentleman's death, the poor cats were dispersed here and there, and the 'institution' fairly broken up. Some went wandering hopelessly about the outside of their old home, mewling in a broken-hearted way; a lot ran off into the neighbouring woods, and became fierce as tigers; while some of the very handsomest were carried off by friends of the deceased. It may be mentioned that though the aforesaid gentleman loved cats, he could not endure either children or dogs; but in other respects he was much like other mortals.

A lady in a respectable position would insist upon always wearing stockings of different colours on each leg, and gloves which were not neighbours on her hands. She boasted that she had never in her life worn a pair of stockings or gloves, and when asked why she did this, she gave for answer that it made her uncomfortable to do otherwise. She rejoiced in a curious assortment of opposite colours in her dress, and delighted especially in a certain green bonnet with blue and yellow flowers in it. Her character was as odd as her tastes; she conceived bitter and unreasonable aversions to certain people, and disliked flowers, which she disposed of under the general name of 'rub-bish.'

A lady's-maid who had been many years in high families, made a point of never laying aside as useless any gown, piece of ribbon or lace, or any other article of dress which might fall into her possession. Her hoards of old things were wonderful; many pieces of raiment grew mouldy with keeping, and her repositories after her death were a sight to behold. Bundles of every hue, pattern, and size, filled her drawers to bursting; ribbons, discoloured and dirty, scraps of print in endless variety, and in short every sort of imaginable article, collected during her thirty years' service, filled one room almost to overflowing. The dates of the various fashions might have been known by the patterns of the pieces of brocade, chintz, and other fabrics which lay around in

wildest confusion. The *embarras des richesses* was so great, that after keeping out a few better things, the rest were committed to the flames, a huge bonfire being the result.

THE DAY YOU'LL DO WITHOUT ME.

IN TWO CHAPTERS.—CHAPTER II.

THE first three years that passed after their parting had gone by peacefully enough, though they were burdened by dullness and poverty. Still they were spent in her old home, among her loved own. But the last five had seen her knocked about from one family of strangers to another; now as companion, now as governess; for her father and mother were dead, and all May inherited from them was a patient brave heart. There had been no lack of lovers during these long years—lovers who were ready not only to woo, but to 'marry and a,' if she could only have awakened from that early dream, and left off wearing that little twisted gold ring. But she could not bring herself to do either. She clung as tenaciously to her old memories as she did to that frail little pledge of the affection Lionel Hastings had forgotten. So she preferred working her way on wearily enough, to forfeiting her claims to cherish hope and her ring.

'She was far too beautiful to be a governess,' all the men said; for time had matured and enriched the beauty that had been very bright and bewitching at sixteen. Poor May! She longed sometimes to shew Lionel the beauty that others prized so highly. Surely if he could see her, he would remember Balton and their old 'young love!'

Her present occupation was a congenial one to her in many ways. She was acting as secretary and amanuensis to a lady, who insisted on being 'literary,' and who, luckily for May, was really fond of reading good works. This lady was sufficiently bright and clever to be able to collect about her a brighter and cleverer circle; and the ability to do this proves no inconsiderable talent. It was while mingling with this circle that May heard the name of her old love again for the first time for eight years.

'Lionel will be here in an hour, my dear Mrs Gaspard,' May heard one evening, and looking round, she saw a stately matron with Lionel Hastings's eyes. 'His mother!' she thought with a thrill, as she obeyed an irresistible impulse, and got herself nearer to Lady Hastings, longing to speak to her, to touch her, to do her some service however slight, for love of the unforgotten Lionel! Suddenly the fact that he would be before her in an hour recurred to her; and the thought of how he would look, and feel, and act, upset her self-possession, and made her falter in the advances she had been about to make to Lady Hastings. But that lady being very keen about beauty, had already marked her.

'Who is the girl with the crown of gold?' she asked of the hostess; and Mrs Gaspard, who was proud of her well-selected library and handsome companion, answered: 'My secretary, Miss Baron. Quite a jewel. I wouldn't have her in the house for the world, if I had a son.'

Lady Hastings laughed easily. 'Those fears are

quite out of date; men are so much wiser than they were. What does she do?'

'Everything.'

'And how does she do it?'

'Magnificently. I hope no one will discover her value and rob me of her. She saves me all trouble, and sings like a prima donna, for thirty pounds a year.'

'Pray, make her sing presently,' Lady Hastings said. And at the same moment Lionel entered the room.

May felt as if the words 'Lionel, don't you know me?' must be painted on her face, as after speaking to Mrs Gaspard and his mother, he turned, and carelessly scanned the form and features of the girl who wore his twisted gold ring upon her finger.

'A golden beauty!' was his thought as he let his gaze travel away from her. 'Never seen her before; quite new, evidently.'

It was a relief to her that at this moment Mrs Gaspard came to her and issued her polite command in the words: 'My dear, will you sing?'

The acute agony she experienced at his non-recognition could not have been borne in silence. She must either have cried out or laughed. Heaven help the women who laugh in their anguish; they suffer more than those who weep. She must do something, she felt, and so it would be as well to sing; and as she got herself to the piano and took off her gloves, she stole another glance at him, and he was looking at her admiringly. His lips had left a kiss on hers which had never been brushed off. And he had forgotten her! Oh, the pain and shame of it! She plunged into something, and sang it well, though every fibre trembled. When she had finished it, he was standing by her ready to offer her a compliment. Again she turned her great trailing violet eyes upon him; but he did not know her. The little ring shone in the lamplight, for May never killed it by wearing another. Doubtless he admired her fingers, but he never noticed the ring.

He spoke to her of her masters, of those who had trained her voice, discussing them and it intelligently. Her voice 'reminded him of a queen of song whom he had heard in Vienna,' he said; and he added that he never forgot a voice. 'Would she sing again? He would like to remember hers.'

How dear he was to her in spite of all his cruel unconsciousness! How desperately dear! How she hated Lady Hastings at that moment, for coming up to him, and putting her hand on his arm, and telling him that she must 'take him away!' How she envied the mother! How she loved the son!

'I am to hear one more song, and then I am at your service.—You will sing again, will you not?' he said; and Lady Hastings backed his request by saying: 'It is really asking too much of you; but do.'

She could not resist the impulse. Before her—though she strove to be blind to it—rose the scene and the actors in it—the day that was full of all summer glory, sweetness, warmth, and light—the velvet lawn and weeping-willow and rose-covered vicarage, and the splendid boy-hero, to whom a lovely shy little girl was reading poetry. She could not resist the impulse. Come what would, he should be reminded of that scene too. And

so when her pearly notes in all their purity smote his ear, they fell on the words:

You love me in your tender way!

I answer as you let me;

But oh! there comes another day—

The day that you'll forget me!

And after one eager gasping glance, he exclaimed: 'Why, it's May—May Baron!' and her song came to an end.

It would be pleasant to have to record that as she was revealed to him, his love for her returned without delay. But mine is a true tale, and therefore I cannot wrest facts to my own pleasure in any such way. As he recognised her, he admired her immensely, and remembered that even in her girlhood she had not been gawky after the manner of other girls. But he entirely forgot that he had ever loved her, or ever acted in such a way as to teach her to love him. There was not the slightest approach to that high misdemeanour in fashionable life—a scene. His self-possession was so easy, so perfect, that May at once recovered her own. True she ceased singing the instant he exclaimed: 'Why, it's May—May Baron!' But even his mother could find no fault with the slow sweet smile and gentle inclination of the head with which the beautiful and clever companion greeted her father's former pupil.

'Let me introduce you to my mother,' he said at once; and May found herself made known to his mother, who complimented her 'on the possession of a charming voice.'

He did not notice the ring. As soon as she recognised that he was absolutely without any recollection of what she had supposed them to be to one another, May took care that he should not see it. She slipped on her glove, and when that was done she felt safer. But she need have had no fear. He had forgotten the episode of the ring as utterly as he had forgotten the words he had spoken when she read the poem under the willow-tree—the same poem she had sung this night.

Presently he asked after her father, and May had to ice herself in order to avoid breaking down as she replied that he was dead. He admired her very much. It was quite a treat to meet with that genuine radiantly gold hair, in conjunction with such intensely violet eyes. She was altogether 'good form' too, and he lazily wondered if she were married. She had not corrected him when he had introduced her to his mother as 'Miss Baron;' but that might be due solely to the fact of her having lived long enough to have discovered that it is not worth while to correct any one for anything.

She was dressed well too. Lionel liked women who were well dressed. He recalled a vision of her in the old days climbing up a tree to get apples for him, in a torn dress and a ragged garden-hat.

'Are you living in town?' he asked.

'I am living here with Mrs Gaspard, and I must go and attend to some of my duties,' she said, rising and smiling at him as composedly as if her heart had not been nigh unto breaking with revived hope and bitter disappointment. She had pictured meeting him a thousand ways, but not one of the pictures had been like this!

He turned to his mother as May crossed the

room away from them. 'She must have made a sensation when she came out,' he remarked.

'My dear Lionel, she is very handsome and nice; but she has never "made a sensation" or "come out," as you seem to think. She is and has been a governess all her life, I suppose. But she is really a beautiful woman.'

'Magnificent! I was in hopes she was married, that I might have seen more of her. She used to be a clever girl, I remember.'

Then there was a fresh arrival. Lovely Lady St John, the leader of the wildest, gayest, most daring set in town, entered, and in another minute a 'friendly' smile flashed round the circle as Bartie Friel lounged in.

Of all spectacles on the face of the earth, Lady St John's reckless disregard of appearances was the most obnoxious to Lady St John's brother. He was fond of her, proud of her, well inclined to believe that there was—as she used to assure him—'no harm in her intimacy with poor Bartie.' But he could not endure the looks that were cast upon the affair. And in exact proportion as he loved his sister, he detested Bartie Friel.

So now, with a sterner face than Lady St John's friends and aspersers cared to smile into, he proceeded to take leave of his hostess and bow himself out of the room. As he was doing this, he heard the man who was carelessly compromising Ida—the man he most disliked in the world, ask: 'Who is that with the jet in her hair? She's the loveliest woman out!' As these words fell on Lionel's ears he remembered that he had not said good-bye to the 'loveliest woman out,' who was no other than his old friend and playfellow May Baron.

He made his way back to her; and some little delay being caused by the increasing crowd, by the time he reached her, Bartie Friel had gained the introduction and was engaging her in conversation.

A sharp angry spasm of annoyance—he could not define the cause of it—seized Lionel Hastings, and he turned away and left the house without giving another word to May.

Well, it was over! And it was over without her having derogated from her feminine dignity at all. There was a certain amount of satisfaction in this; but the dubious satisfaction was not balanced altogether by the keen anguish she felt at that utter forgetfulness of his. 'After this, I can never wear his ring again,' she thought, and she tried to take it off. That ring had been given to her as a pledge, and he had forgotten that he had given it!

That night the ring and his one letter were packed up and carefully put aside. She could not make up her mind to destroy them, though something told her that it would be wiser to do so. But 'just for a little longer,' she pleaded with this instinct of hers. And so 'just for a little longer' she kept them.

Mrs Gaspard prided herself upon 'living in a whirl.' She went everywhere, and received every one, and so May, her beautiful companion, was very much before the eyes of that portion of the world who constituted Mrs Gaspard's 'set' at this juncture. Further, Mrs Gaspard had 'no prejudices,' she was fond of averring, and so Bartie Friel, who was rather a black-sheep by this time, received a warm welcome whenever he came to

the house. But though a black-sheep, he was a marvellously attractive one; and so people talked about him and about what he was doing and what he might be expected to do. His admiration for Miss Baron did not remain a secret very long. Every one heard of it; among others, Lady St John and Lionel Hastings.

It is greatly to be feared that every one is afflicted with that baleful thing, a too communicative friend. At any rate, Lady St John was so afflicted, and thus it happened one day, when Lionel was quietly having a cup of afternoon tea with his sister, that they learned from the lips of this friend that Mr Bartie Friel was positively going to marry that Miss Baron who lived with Mrs Gaspard!

Lady St John received the tidings with the utmost *sang-froid*. 'Is he?' she asked indifferently.

And the friend replied in a friendly manner: 'Yes. I wonder he has not told you?'

What could Lady St John do but acquiesce in that wonder faintly.

'Bartie Friel marry that girl!' Lionel exclaimed the moment he was alone with Ida. 'She shall know what he is before she is a day older. Why, she's a good girl. The fellow would shock her out of her life or her reason.'

'O Lionel, don't be harsh; don't malign him,' she muttered.

Lionel scowled.

'Then spare me,' she pleaded in a lower voice. 'I know how you blame him; but spare me. Let him marry her if he loves her;' and then she began to weep bitterly.

He would make no promise; but he went away from her feeling sorely distressed. Was she not his own sister? 'Poor girl!' he thought bitterly; and then he remembered the other one. At least he would—for old friendship's sake—go and hear from May Baron if there were any truth in this vile report. He could not help calling it a 'vile report,' as he reflected on some portions of Bartie's career, and contrasted them with all he knew of May.

'Why, I was in love with her myself when I was a lad,' he thought, and he wondered if May ever thought about that. An hour later he was inquiring for Miss Baron at Mrs Gaspard's door, and hearing that she would receive him.

She was quite as composed as on the occasion of their meeting that first night—quite as composed, and quite as beautiful. He could not stand by patiently and see her become the prey of such a one as Bartie Friel.

'On the score of old friendship, I am going to presume greatly with you—greatly, Miss Baron,' he began.

She opened her eyes in astonishment. 'Haven't you forgotten the old friendship yet?' she said. 'What a wonderful memory you must have!'

'Indeed, I have not forgotten the old friendship,' he replied gently; 'it prompts me to say something that you may not like to hear.'

He paused, and her treacherous heart began to beat. But she was mistress of herself. His ring and his letter were nestling in her bosom all the while. And he could speak calmly of 'old friendship!' 'Men differ from women with a vengeance,' she thought. 'He who *kissed* me, to ask if I have forgotten our old friendship!'

'They say you are going to marry a man of whom you know very little,' he began softly. And her face and heart grew like stone. 'Tell me, is this true?'

She made no answer; and he thought: 'She is resenting my interference; she has forgotten how fond I was of her when I was a boy, and she looks upon this as mere impertinence.'

Nerving himself by all he knew about Bartie Friel and all he thought about Bartie Friel, he resolved: 'He shall never have her! The splendid creature! She deserves a better fate than to be a worn-out *roué's* wife;' and he spoke, warming with his words: 'You're astonished at my presumption in interfering; I feel sure of that. But May, I can't forget the old days when we were children together. Can you?'

She bent her head down lower, and he could not see her eyes; but he went on: 'You have forgotten probably, May, and why should you have remembered indeed? But I will remind you, and then you will understand that it is more than mere friendly interest that prompts me to interfere.' Memory jogged him at this moment, and he went on glibly: 'You may have forgotten how I loved you, darling'—

'Have not you been the one to forget?'

'On my faith, no! Not now, when I see you again,' he protested ardently; and then, as he clasped her in his arms, she shewed him the ring and the letter, and sang him a verse from the song that had wakened his memories:

I do not fear the darkest way,
With those dear arms about me;
But oh! I dread another day—
The day you'll do without me!

AMUSEMENTS OF THE LEARNED.

THAT learned folks as well as others indulge in amusements of an eccentric nature, may be gleaned from the following examples, culled at random.

Cardinal Richelieu we are told, spent his hour of relaxation in leaping over the furniture, and on one occasion he was discovered jumping with his servant, to try which could reach the high side of a wall. De Grammont knowing the Cardinal to be jealous of his powers, offered to jump him for a wager—a proposal which shews the courage, as much as the event shewed the diplomacy, of the courtier. The offer was accepted; but De Grammont took care that his leaps should never quite reach those of His Eminence; and thus he lost a few louis, but gained speedy and high promotion, by the favour of his triumphant and gratified opponent.

Dr Johnson's play-hour was employed in taking a walk down Fleet Street; but then that walk was so cunningly saddled with self-imposed conditions, that it became a feat as difficult as it was amusing. The first condition was, that every post should be touched as it was passed; and so resolutely did the Doctor observe this rule, that if he happened to pass one without giving it the magic touch, he would return the moment he became aware of his neglect, and gravely perform the mystic ceremony. Another rule rigidly complied with by the great lexicographer was, to step always exactly in the centre of the flagstones as he 'rolled grandly along;' and a great adept he must have become in this style of

geometrical progression, for even that most microscopic of observers, Boswell, does not record a single failure. But the *tour de force* of this extraordinary promenade was reserved for its conclusion; for the Doctor on reaching his house made it compulsory upon himself to cross the threshold with one particular foot. In order to do this gracefully, it was necessary to commence a series of measured steps at a certain distance from the imaginary hurdle. It is apparent that some very nice calculations were necessary so as to perform this feat, and we are not surprised to be told by Boswell that the good Doctor occasionally failed, and—as he would on no consideration enter with the wrong foot—turned back again for a new start. Which foot—whether the right or left—the Doctor required to enter by, we shall never know, since Boswell himself confesses that he does not recollect.

These tricks of Dr Johnson are considered inexplicable by all who have observed them or commented upon them; but it seems not at all unreasonable to ascribe them to that desire of amusement which made Richelieu jump over his furniture, and which we have ample proof burned as strongly within the Doctor as it did within his young friends Beauclerk and Langton—those 'dogs' with whom the learned man went to have a 'frisk' at three o'clock in the morning. So that while the lexicographer could not, on account of physical disabilities, engage in the sport of leaping over chairs, we are not in the least surprised that such a wise and frolicsome man should invent a game which combined the physical exercise of base-ball and the mental labour of chess, and having invented it should regularly practise it. A very different man was Shelley, who derived great amusement from sailing paper-boats upon the Serpentine and the lakes in Hyde Park. Long practice had made the poet an adept in the construction of these toys; and when they braved the winds and waves, Shelley would run round with eager delight to the opposite shore, and receive into harbour his brave little craft.

Jean Jacques Rousseau's was a nature in many respects resembling that of Shelley, and he had the same love of simple and natural amusements. Jean Jacques, when he was in the country, would carry huge stones—as big as he could carry—up to some high cliff, and there he would dispose them in a pile. Then laying himself securely upon the cliff, he cautiously advanced his face till he could see clearly the foaming waters below; and one after the other the stones were hurled over the declivity by the philosopher, who watched with delight the heavy mass as it rolled and bounded before it reached the bottom.

The poet Cowper's amusement was a thoroughly practical one, and is thus humorously referred to by him in a letter to his friend Unwin: 'Amico mio, be pleased to buy me a glazier's diamond pencil. I have glazed the two frames designed to receive my pine plants. But I cannot mend the kitchen windows till by the help of that implement I can reduce the glass to its proper dimensions. If I were a plumber, I should be a complete glazier; and possibly the happy time may come when I shall be seen trudging away to the neighbouring towns with a shelf of glass hanging at my back. If government should impose another tax upon that commodity, I hardly know a busi-

ness in which a gentleman might more successfully employ himself. A Chinese of ten times my fortune would avail himself of such an opportunity without scruple; and why should not I, who want money as much as any mandarin in China?'

While the cloud which had long obscured his faculties was slowly rising from the poet's mind, it will be remembered how he dreaded human intercourse, but delighted in the company of his two tame hares. When at length, one of the hares became sick, Cowper nursed it with the greatest care, and the animal upon its recovery thanked its protector in a most unmistakable and singular manner. 'No creature,' says the poet, 'could be more grateful than my patient, a sentiment which he most significantly expressed by licking my hand; first the back of it, then the palm, then every finger separately, then between all the fingers, as if anxious to leave no part unsaluted.' What is remarkable in this episode is the fact, that never before nor after did the creature behave in a similar fashion except once, when it was attacked a second time with sickness. The gentle poet nursed it as on the first occasion; and upon recovery the second time the identical ceremony of thanks was repeated by the grateful animal.

Having touched upon the attachment between Cowper and his hares, we may best conclude these remarks by a reference to Dante and his cat. This creature was not only a solace to the poet during his hours of relaxation, but was a humble servant to him while he was dining or reading; for having been taught to sit with a lighted candle between its paws, puss acted as a faithful torch-bearer on these occasions.

And yet, the following anecdote shews that the cat remained wonderfully cat-like still. Dante maintained, in an argument with Ceccio, that art was more potent than nature, and referred to the ability of his cat as a demonstration of the correctness of his views. An appointment was made in order that Ceccio might see for himself the conduct of grimalkin, and the disputant came, well prepared, however, with a test which should try the thoroughness of the change in the feline nature. For while the cat was sitting with the candle between its paws, Ceccio emptied the contents of a bag which he had filled with mice, upon the floor. Is it necessary to add that the candle was at once dropped, and that puss flew after her natural prey?

THE SURGEON AND THE MOGUL'S DAUGHTER.

It was the summer of the year 1651. Shah Jehan, grandson of the mighty Akbar, had been for four-and-twenty years on the throne of the Great Mogul. He was the most magnificent and luxurious of all the Moguls. Before the radiant and amazing splendours of his court all the pomp and glory of the greatest monarchs of the West paled into insignificance. He had been known to spend a million and a half sterling upon a birthday festival. His royal progresses through his dominions surpassed in grandeur and sumptuous display all that even the oriental imagination had conceived. Travellers told with awe of the acres of land covered with carpets of silk and gold; of the stately pavilions glittering with diamonds and

pearls; of the gorgeous tents of crimson velvet embroidered with gold, supported by massive poles forty feet high, and stretching over long miles of level country; of the seven resplendent thrones studded with diamonds, rubies, emeralds, pearls; of the world-renowned Peacock Throne, Shah Jehan's own fanciful invention, so called from a peacock with its tail spread, the natural colours faithfully represented in sapphires, emeralds, rubies, and pearls, which formed the chief ornament and design of a mass of diamonds and other precious stones valued at six millions and a half sterling.

They told, too, of the elephants that looked like shining mountains of jewellery—elephants trained to kneel before the throne and do reverence to the Great Mogul with their trunks—whose keep cost five hundred rupees apiece per month; of the magnificent horses on whose bridles and saddles the gems stood thick as dew-drops on a lawn at sunrise; and of a thousand other lustrous and dazzling marvels, the mere mention of which made men stand agape with wonder and astonishment. Not Solomon in all his glory could compare in lavish splendour with Shah Jehan the Great Mogul.

And now, after nearly ten years of incessant war, there was peace in the Mogul Empire, and the Emperor had come to enjoy his well-earned repose, and revel in the luxury which he loved at his capital Delhi—that Delhi which he had restored to more than its ancient glory, whose marble halls and spacious courts and golden domes and stately mosques he could proudly boast were unequalled anywhere for grace and beauty and sublimity. For Shah Jehan had a passion for noble and beautiful buildings—the mausoleum which he erected to his wife at Agra, known as the Taj Mahal, standing to this day as one of the noblest monuments in the world.

But passionately as Shah Jehan loved luxury and magnificence, gorgeous pageants, and splendid buildings, there was something he loved more passionately still, and that was his eldest daughter. In all his vast empire there was no lovelier, more charming, or more accomplished lady than the Padshah Begum. Shah Jehan idolised this his favourite child. She was his constant companion. She enjoyed his confidence to an extent which men very rarely allow to women in the East. Her lively conversation, her skill in the use of musical instruments, her gift of melodious song, could always charm him into amiability. She was the light of his life, the only being that, since the death of his queen, he really loved. His sons he distrusted and suspected, and not without reason, for filial affection was a virtue which had always been conspicuous by its absence among the sons of the Moguls, and he was himself destined to die a prisoner in the hands of his own son Aurungzebe, who deposed him. It was on his daughter, therefore, that he lavished all the tenderness that was in his heart. The Padshah Begum was now in her twenty-second year, and in the full flower of her beauty and womanhood. Who could have dreamed that so fair a lily could be blighted in a single night?

It was an evening in July; Shah Jehan lay dozing under the gentle fanning of the punkah, when he was roused by a piercing shriek, followed in quick succession by a series of shrieks, each

more heart-rending and blood-curdling than the last. He raised himself to listen. It was apparently from the women's apartments that these appalling cries proceeded. Whilst he listened, the shrieks grew fainter and fainter, and were succeeded by a wailing sound, as of many voices moaning. Suddenly the curtains were pushed aside, and a servant pale, trembling, and breathless, entered and prostrated himself before the Emperor. He was impatiently asked what his tidings were. Groaning and beating his breast with his hands, he stammered out his news—news that made Shah Jehan leap to his feet—while his swarthy cheek grew livid with pallor, and he stood rooted to the ground with horror and amazement. For the news was that the Padshah Begum had been burned to death! It was but for a moment that Shah Jehan stood there petrified and horror-stricken. In another instant he had darted off in the direction of the Princess's apartments to learn for himself whether the dreadful tidings were true or not. He was like a maniac as he burst into the chamber where his daughter lay upon a couch, surrounded by her women wailing and wringing their hands. Already two of the court physicians were there, and were stripping the charred remnants of her robes from the scorched and blistered limbs. She was not indeed actually dead, as the messenger had reported, but she had fainted from the terrible agony of her wounds, and lay there quite unconscious. The ghastly sight almost deprived the Great Mogul of his senses; distracted and overwhelmed with grief, he flung himself beside his beloved daughter, and passionately called upon her to speak to him. Then he turned to the physicians and implored them to restore his daughter to life, promising them the most extravagant rewards if they succeeded. But the physicians, however skilled they may have been at curing internal diseases, were bunglers at healing wounds. They shook their heads gravely, and seemed to think the case hopeless.

It was then that the Grand Vizier, Assud Khan, bethought him of the English traders at Surat. He remembered that the surgeons who came over in the East-Indiamen had wrought some wonderful cures, and had acquired a high reputation for surgical skill. He therefore suggested to his master that an Express should be sent immediately to Surat, with orders to travel day and night, and bring back with the utmost speed an English surgeon. It was a 'far cry' from Delhi to Surat; but the Express had extraordinary powers to take what horses or supplies he needed from whomsoever he pleased on his journey; and by dint of travelling day and night as fast as horses could carry him, it was just possible that the English surgeon might be brought to Delhi before it was too late.

The *Hopewell* East-Indiaman had just arrived at Surat from England, when the imperial Express dashed into the settlement. The ship's chief surgeon, Gabriel Boughton, had gone ashore, and was at the residence of the Company's factor when the Mogul's messenger was announced. Without a moment's hesitation, Boughton offered to return at once with the Express. The factor privately warned him that should his skill fail, things might be made very unpleasant for him at the Mogul's court. But the young surgeon had plenty of

pluck and self-reliance; and besides, the thought of having such a patient as the favourite daughter of the Great Mogul excited his professional ambition. It would be sheer madness to throw away such a splendid chance of winning wealth and distinction simply because there was some risk attaching to it. And so, without further parley, Gabriel Boughton prepared to start for Delhi.

In less than two hours from the arrival of the messenger, the English surgeon was riding at headlong speed on the mission which was to make or mar his fortunes. Weary, anxious, and almost exhausted, Gabriel Boughton reached the Mogul's palace, and was rejoiced to learn that he was not too late. He was led at once to the apartments of the Padshah Begum, and there he found Shah Jehan, who had never left his daughter's side. Haggard and worn and wan from constant watching, sleepless anxiety, and poignant grief, the Great Mogul looked almost as fit a subject for the doctor's skill as his unhappy daughter. The moment he saw the face of the English surgeon, he rushed to him, clutched him by the arm, and in imploring accents besought him to cure his daughter, declaring on his sacred oath that whatever reward the surgeon might ask should be granted him, were he but successful. To have the richest and most magnificent monarch in the world thus a suppliant almost at his feet, might well have shaken the strongest nerves. But Gabriel Boughton was calm and collected, and set about the delicate and critical task before him in that cool business-like manner which was even then a marked characteristic of English surgeons, and which served more than anything else to inspire the natives of India with confidence in their skill.

By his unwearying attention, his patient care, and skillful treatment, Gabriel Boughton succeeded in effecting a complete cure. Not only was the Padshah Begum restored to health, but her beauty was little if at all impaired by the terrible injuries she had suffered. The gratitude and joy of Shah Jehan knew no bounds. The Grand Vizier, Assud Khan, to whom Gabriel Boughton owed his introduction to the imperial court, was commissioned to inform the fortunate surgeon that on a certain day the Great Mogul would grant him a special audience in state, that he might then claim his reward, and that whatever he might demand the Emperor pledged himself to grant. The Grand Vizier was obsequious in his manner, knowing how politic it was to secure the good graces of a rising favourite, and even ventured to hint at a future so brilliant and dazzling, that Gabriel's brain went dizzy at the prospect. Left to his own meditations, the surgeon pondered deeply over his position. He was young, he was good-looking, he was ambitious. Here was a father whose heart was full of the most extravagant and reverential thankfulness towards him; here was a daughter equally grateful, and even more favourably disposed towards him than her father. What was to prevent him from asking her hand, and becoming the most powerful and influential personage at the court of the Great Mogul? To Western ideas, such an aspiration might seem too audacious and romantic to be entertained for a moment; but in the East there were plenty of precedents for such a reward,

granted for services of great value—why should he not make this bold bid for position and fortune?

The day appointed for the state-audience with the Great Mogul arrived. Seated on his splendid throne, the high heron plumes, clasped with diamonds, adding majesty to his face, his dress one blaze of brilliants, by his side, unveiled, the beautiful Padshah Begum, around him his magnificent retinue of nobles, scarcely less gorgeously clad than himself, Shah Jehan prepared to receive the man who had done him a service which, as he gazed lovingly at the sweet face beside him, it seemed that the whole of his imperial treasury was hardly rich enough to repay. The Englishman bowed low as he came into the presence of the Emperor. Then Shah Jehan beckoned him to come nearer, took him by the hand, and looking significantly at the Padshah Begum, bade him name his reward. There was breathless silence as the young Englishman opened his lips. And what was the price he claimed for his services? He asked for no private emolument; he sought no selfish advancement; he simply solicited that his countrymen, the traders of the East India Company, might have liberty to trade free of all duties in Bengal, and establish factories in that province! What the Padshah Begum thought of this unromantic request, or whether she had ever dreamed of any such romantic termination to the episode, as the Grand Vizier had vaguely hinted at, history does not say. But Shah Jehan himself was profoundly impressed with the magnanimity and unselfishness of the English surgeon, and gave his solemn word that the most ample privileges and opportunities for trading should be granted to the English merchants.

Boughton had thought the matter out patiently and carefully, and had decided that the position of favourite and son-in-law of the Great Mogul, though dazzling, was precarious; that he should simply surround himself with unscrupulous enemies, who would sooner or later effect his murder or his disgrace; and that even those who were his friends at first would come to regard him as an upstart and an alien, usurping the riches and the power that should belong to one of themselves. It would be wiser to use his great influence over the Mogul to promote the interests of the Company, whose servant he was, and look to the Company for a reward, which though less splendid and romantic, would be safer and more enduring. So he dismissed the fanciful dreams which for a moment had filled his brain, and chose the humbler and more prudent course.

But Shah Jehan would not hear of Gabriel Boughton's going empty-handed away. He invited him to take up his abode at the palace as chief court physician; and this invitation Gabriel thought it advisable to accept, because his presence at the imperial court would give him excellent opportunities for pushing the interests of the Company, besides enabling him to lay the foundation of a private fortune. Several other successful cures following close upon that of the Padshah Begum established Gabriel Boughton's reputation, and spread his fame far and wide. His popularity was extraordinary, mainly perhaps, because, as he never meddled with political matters, foreign or domestic, no one was jealous of him. How long he remained at the court of Shah Jehan

is uncertain; but he at anyrate did not leave until he had seen the Mogul's promises most amply fulfilled, and the Company reaping the fruits of these liberal concessions. The richest province of India was thrown open to the English traders, free of all duties and payments whatsoever; and from the granting of that extraordinary privilege the East India Company dated its first great stride towards the wealth and power which eventually made it the arbiter of the destinies of India. Historians are often apt to overlook the small causes from which great events spring. And most of the historians of India have wholly ignored the claim of Gabriel Boughton to be considered one of the true founders of the British Empire in India. A less public-spirited or far-sighted man would have used his immense influence over Shah Jehan for his own selfish aggrandisement. It is to the undying honour of Gabriel Boughton that he did otherwise, and thereby raised the East India Company from a struggling body of coast-traders into the richest corporation of merchants in the world. It is this fact, we feel, that renders worthy of more detailed narrative than we have ever yet seen allotted to it in any single history, the romantic episode of the Surgeon and the Mogul's Daughter.

THE MONTH.

SCIENCE AND ARTS.

THE present year has been so exceptional in respect of weather that it will be interesting to place a few facts on record. The usual average of rainfall, as reckoned by meteorologists for the first six months of the year, is nearly twelve inches: this year the fall from January to June was eighteen and a half inches! The prodigiousness of the excess may be judged of by comparing it with the years 1858, 1864, and 1874, in each of which the total rainfall was less than nineteen inches. The superabundance of water during the present year may be regarded as calamitous. The effect is aggravated by deficiency of sunshine. Observations made at the Royal Observatory, Greenwich, shew that in the first six months of 1878 there were six hundred and forty-three hours of sunshine; this year there were four hundred and seventy-one hours only. June 1878 was spoken of as a gloomy month; but it had one hundred and eighty-one hours of sunshine, whereas June 1879 had not quite one hundred and nineteen hours. So wet a June indeed as the last has not occurred for twenty-seven years, with the exception of June 1860, when the rainfall was more than seven inches; and it is clear that a long spell of dry weather will be required to restore the balance.

July was expected to make amends for the previous deficiency; but that usually sultry month proved less propitious than June. The landscapes were green everywhere; but luxuriant leafage and rank grass are not equivalent to sunshine, and the weather-prophets who predicted an intensely hot dry summer, found themselves at fault in the presence of persistent rain. The cold for the seven months prior to July was greater than it has been for one hundred and sixteen years. Readers who desire to understand the common-sense of the question of the weather

should read *Modern Meteorology*, a little book published under the auspices of the Meteorological Society.

Messrs Lawes and Gilbert, the well-known agriculturists, have communicated to the Royal Society an account of their experiments with different manures on the same land during a number of years. They mention that so great have been the difficulties encountered, that after their years of labour and examination of the subject, as well from the chemical as from the botanical point of view, Messrs Lawes and Gilbert say that they can 'hardly claim to have yet done much more than reach the threshold of a very comprehensive inquiry.' The experiments were made on seven acres in the park at Rothamstead, near St Albans. Of the plots into which the land was divided, two were left without manure from the commencement; two were treated with ordinary farm-yard manure, and the others with different kinds of artificial manure, applied for the most part year after year on the same spot. On the unmanured plot the yearly average crop of hay has been about twenty-three hundredweights per acre; but on the most heavily artificially manured plot about sixty-four hundredweights. With these great differences in the amounts of produce, as the experimenters remark, the botanical character of the herbage has varied most strikingly. Whatever promotes growth occasions a struggle; and while some plants are increased, others are diminished, until on some plots, and in some seasons, less than twenty species are discoverable. 'Even in the first years of the experiments, it was noticed that those manures which are the most effective with wheat, barley, or oats, grown on arable land—that is, with graminaceous species grown separately—were also the most effective in bringing forward the grasses proper in the mixed herbage; and again, those manures which were the most beneficial to beans or clover, most developed the leguminous species of the mixed herbage, and *vice versa*.'

By means of chemical tests, the amount of constituents developed in the several plants was ascertained: the dry matter, the nitrogen, the potash, and the phosphoric acid; and at the same time the soil of every plot, at different depths, was chemically examined. Important variations were discovered, according to the nature of the manure which had been employed.

Professor G. Ville of Paris has published a book on Artificial Manures and their application to agriculture, which has been translated into English by Mr Crookes, F.R.S. (Longman & Co.) It is a readable volume, clear and lively in style, discusses theory and practice, the composition, growth, nutrition, and cultivation of plants, the assimilation of carbon, oxygen, hydrogen, and nitrogen, the function of mineral matter in plant production, the comparative cost of farm-yard and chemical manure, the importance of the waste parts of crops as fertilisers, and other topics, which include tables for calculating the exhaustion of the soil and regulating the feeding of live-stock. In the chapter headed 'Agricultural Industry,' Professor Ville points out the way to cultivate beet-root and carry on a distillery at a profit. 'To consume beet-root,' he says, 'to export alcohol, and to provide pulp for live-stock, a distillery is equal to an increase of meadow-land, since it pro-

cures an increase of food for the animals. On the other hand, the industrial product that we export is alcohol, and this exportation will not in any way lessen the fertility of the soil. Rain-water and the carbonic acid contained in the air cover all the cost, and provide all the raw material; for alcohol contains nothing but carbon, hydrogen, and oxygen. Practical farming confirms the fact that distilleries contribute to the amelioration of the soil, and science explains why.'

Professor Ville is of opinion that English farmers should manufacture chemical manures for themselves, instead of paying unreasonably high prices, as at present. He gives an example: a certain manure, largely used, is sold at twelve shillings the hundredweight. It contains phosphoric acid soluble and insoluble, and nitrogen in the form of ammoniac sulphate, the cost of which amounts to six shillings and fourpence-halfpenny. And besides the saving in expense, there is the assurance that the article is genuine. 'Calcic superphosphate,' says Professor Ville, 'is rather more difficult to manufacture, on account of the necessity of procuring the sulphuric acid. But when a co-operative association has secured the services of a practical chemist, this difficulty vanishes, and the result is well worth the trouble. The farmer will for twopence three-farthings per pound obtain a soluble phosphoric acid, for which manufacturers have been charging him about sixpence.'

The Agricultural Show at Kilburn was so unfortunate in weather that many articles of permanent interest were but little noticed amid the damp disappointment. Among them was a corn screen or separator, exhibited by a Frenchman, which effects its object by means of a series of cells, instead of passing the different kinds of grain or seeds between wires or through perforations. The action is described as rather slow; but the machine perfectly separates long from round corn; wheat from barley or oats, from peas, vetches, and smut, and divides wheat into two qualities.

Another French invention is an ingenious agricultural wheelbarrow, which opens in front, and discharges the load over the wheel. Another is Mr Noël's pump-valve, described as 'simplest of the simple, being just an india-rubber ball resting upon a seat, and confined in a cage fixed over it.'

Ruston and Company exhibited a steam-engine with patent fire-box, in which the smoke and gases pass downward between the bars, instead of flying off by the usual upward draught; by which all the smoke and much of the gases are consumed, with considerable development of heat and saving of fuel. The fire-bars are tubes filled with water, and thus are prevented from burning away.

Want of coal and wood as fuel has hindered the introduction of steam-machinery for agricultural purposes into some parts of the south of Europe where, on the broad plains, wheat is grown abundantly. Messrs Ransomes and Company have overcome the hindrance by a steam-engine which will burn straw, reeds, cotton-stalks, cane-waste, and such-like products, greatly to the satisfaction of the foreign farmers.—Fowler and Company exhibited a portable railway of twenty inches gauge, of which a mile can be taken up and relaid in a different place in one hour. It is available for horse-power or steam-power.—And a self-acting

park gate that opens and shuts on the passing of a vehicle, being operated by two alternating water-vessels in an underground tank, exemplified the ingenuity of Mr Walton.

The use of wire-ropes for traction in ploughing by steam is open to the objection that there is much friction, and that the power is applied at a distance. Mr Darby, of Chelmsford, exhibited a Pedestrian Broadside Digger, which applies its power directly on the spot where it is wanted. It is a steam-machine of ten horse-power, with wheels on one side, and legs and digging-forks on the other. According to the description: 'The forks and legs work in pairs, digging the ground, and at the same time slowly propelling the machine broadside on, in any direction, as may be required. The width of work taken at once is nineteen feet and a half, and the pace is variable, according to the depth and coarseness or fineness of the tillage. When at the rate of half a mile an hour, the digging amounts to about ten acres a day, with the assistance of one man and a boy, in addition to the supply of coal and water.' This seems to be the cheapest means of tillage yet invented.

The offer of a prize for a railway van which would keep fresh meat or poultry in good condition during a long journey, brought forward two competitors, who were subjected to a severe trial. Meat, poultry, and rabbits were placed in the two vans on June 19, and sent to Holyhead and back, and kept undisturbed till the 28th, when on examination the contents, with some exceptions, were found in good condition. The prize was consequently awarded to the Swansea Wagon Company of Glamorgan, the makers of the successful van, which, in addition to other merits, maintained an interior temperature of thirty-nine degrees whether in motion or at rest. The importance of this achievement will be apparent to all who know how essential it is that meat should be brought to market in a perfectly wholesome condition. It supplements satisfactorily the successful transport of meat thousands of miles across the sea which has been some time in practice.

It would be a triumph of optics and chemistry if photographs could be made to represent the natural colours of objects. Attempts towards this result have hitherto ended for the most part in disappointment. But Captain Abney in a short paper 'On the Production of Coloured Spectra by Light,' read before the Royal Society, makes known that he has succeeded in producing approximately in the natural colours, pictures of the solar spectrum on silver plates, and also, but less brilliant, on compounds of silver held in place by collodion. 'I reserve for the present,' he writes, 'the exact details of the production of these pictures, but may say that they are produced by oxidation of silver compounds when placed in the spectrum; an exposure of two minutes being amply sufficient with a wide slit to impress the colours. The colouring-matter seems to be due to a mixture of two different sizes of molecules of the same chemical composition, one of which absorbs at the blue end, and the other at the red end of the spectrum, and the sizes of these molecules are unalterable while exposed to the same wave-lengths as those by which they were produced.' And he is of opinion 'that the colours may be preserved unchanged when exposed to ordinary daylight.' From this it will be under-

stood that Captain Abney has made a step in advance, of high importance.

In connection with this we mention improvements in colour-printing, by which Herr Albert, court-photographer at Munich, produces chromo-photographs of surprising excellence. The process commences by the taking of three photographs, each being exposed to the action of different and definite portions of the spectrum. This is effected by causing the light, before it reaches the sensitised plate, to pass through coloured glasses, or suitable coloured liquids, and moreover, by employing in each case special solutions for the development of each negative. A positive printing-plate (a glass plate gelatinised) is then produced for each negative; and if the absorbing media and the developing preparations have been correctly chosen, it is only necessary to colour one of these plates with red, another with yellow, and the third with blue, in order, by successive printings, to obtain a picture which exhibits more or less resemblance to the original. Success appears to depend on the skill and nicety with which the absorbing materials are employed, for mixtures of colours and of colouring materials are quite different things; and, to quote the technical description, 'for the negative belonging to the blue plate we must employ such absorbing media and preparations as will prevent green from producing any influence on it, and at the same time will render blue and violet quite inactive, inasmuch as these tints must appear only on the positive plate.'

Specimens of landscapes and of decorative panels printed by Herr Albert's process, were exhibited at scientific receptions in London during the past session, and were deservedly admired. The details were shewn: a plain yellow picture; then on the yellow a blue, and on the blue a red; and with these three the effect of a well-finished water-colour drawing was produced.

LINES ON THE DEATH OF GOTHARD

A FAVOURITE ST BERNARD DOG.

A CALM majestic dog, and fitly named,
Imposing, stately, as the mountain famed,
Was Gothard. One of pure St Bernard race.
A world of wisdom in his thoughtful face.
Grave consideration! had his powers been tried
On Alpine heights (his work to him denied
In English home), how he could best expend
His strength, in skill and gentleness, to lend
Assistance to those dying in the snow,
Unseen by man in frozen depths below,
But known by canine instinct to be there,
And saved from death by canine strength and care.
His strength was all unused in English home;
No snow, nor ice, no mountain heights to roam;
No crash of avalanche to wake his ear;
No practised eager watch for travellers near.
It seemed a waste of power—Sagacity
Had little scope, but yet Fidelity
Had room, and strong, deep love and jealous care
Of home, and her he owned as mistress there.
He had no higher work to do; but well
He filled his place. Ah me! 'tis sad to tell
How soon that work was done, how keen the smart
His death, unlooked for, caused to one true heart,
Which found him, though a dog, companion, friend,
And misses sore the charm his life did lend.

LAND TRANSFERS.

It is now about two years since the Dimsdale frauds, which consisted in the manufacture of false titles to property and similar documents. It was a system of swindling on a comprehensive scale, arising out of the loose slip-slop legal procedure of England as regards the purchase and transfer of real estate. Being detected, tried, and convicted, Dimsdale is now suffering the penalty due to the enormity of his crimes. Till this day, however, the law which permitted tricks of this kind remains unchanged; for even when shewn they are wrong, the English are from various causes difficult to move. At length, the subject of land transfers has been under the consideration of a Parliamentary Committee, and may be legislated upon. Meanwhile, we should like, for general information, to run over the arrangements prevalent in Scotland.

According to the Scotch system, there is no huddling up of land rights. All transactions are above-board, and open to general observation—not that unconcerned persons give themselves any trouble about the rights of this or that one, but the law offers facilities, if people, by paying a small fee, like to inquire. Practically, none but a party interested ever institutes any inquiry. This publicity, to call it so, is secured by means of registers, dating from an early period. At one time, registration was optional; but that, as has been exemplified in England, was found to be illusory. The true date of the present system of registration was 1599, when, by the introduction of district registers, every species of conveyance of lands had to be recorded, under pain of nullity. The system was put on an improved and permanent footing in 1617, when a statute was passed which has since remained the leading one on the subject. It is thus observable the Scottish law of land rights is nearly three hundred years old.

The estimation in which Scotch lawyers held the system, as then established, may be judged of by the strain in which Sir George Mackenzie, the Lord Advocate of his day, refers to it after it had

been in operation more than sixty years. 'Some inventions,' he writes, 'flourish more in one country than another, nature allowing no universal excellency, and God designing to gratify every country he hath created; so Scotland hath, above all others, by a serious and long experience obviated all fraud by their public registers.' From 1617 till 1868, when all the district registers were directed to be kept at Edinburgh, one for each county, improvements have been made from time to time; so that if the eulogium just quoted was at all merited two centuries ago, we may assume that perfection has now been nearly attained. We need not enter into details of the several changes. It will be sufficient to indicate shortly the way in which the system now operates.

The principle of the system is that priority of registration secures priority of right. Thus, if two parties hold conveyances to the same property, the one whose conveyance is first recorded, though granted subsequent to the other, has a preferable title. The same result follows in mortgages or bonds over property—the lender whose bond is first recorded having a security preferable to all others, purchasers or lenders, whose deeds may be recorded subsequently, and this irrespective altogether of the dates they bear. It will thus be seen that conveyances of property, or bonds over it, do not act as completed transfers or securities till recorded, and may be rendered altogether nugatory by a deed being put upon the record before them. Unrecorded deeds are binding on the granters personally, but do not affect third parties ignorant of their contents.

The centre of the Scottish registration system is the General Register House, Edinburgh, a spacious modern building, carefully arranged for its assigned purpose, and forming the receptacle of numerous state papers and records of much public value. The chief officer of the establishment is the Lord Clerk-Register, who, besides having a Depute, presides over a large staff of officials, noted for their assiduity in carrying on the public service. In the department connected with the transfer of land rights, where there is

usually a pressure of business, clerks are ready to receive any deed affecting heritable property. When lodged, the first step is to enter in a register known as the Presentment Book such particulars as are necessary to identify it; and the order in which the several deeds appear in this register determines the priority of the rights of the parties in whose favour they are granted. Suppose a mortgage to have been lodged and entered in the Presentment Book at seven minutes past twelve o'clock noon, a second mortgage on the same property lodged and entered one minute later, would be postponed to the former, though it may have been granted previously.

This rigorous accuracy has given so much public confidence, that the impugning of land titles is scarcely known in Scotland. Deeds sent by post to the registrars are in like manner entered in the order in which they are received. The deed is afterwards engrossed verbatim in the Sasine Register; and before being returned to the person by whom it was lodged, has a doquet indorsed upon it stating the date of presentation, and the volume in which it is engrossed. A short abstract of the deed is also prepared and inserted in a Minute Book, so as to supersede the necessity for referring to the book in which it is written at length, and so to facilitate subsequent searches for encumbrances affecting the property. The charge for recording is made on a graduated scale according to the value of the property. A deed conveying property worth five hundred pounds, or a mortgage for that amount, costs two shillings per two hundred words. The maximum rate is charged when the value exceeds five thousand pounds, the charge then being three shillings per two hundred words, with seven and sixpence additional per deed. An ordinary conveyance often contains about eight hundred words, and the expense of recording such a deed would accordingly range from eight shillings to nineteen shillings and sixpence, as the value might be less or greater.

All the records are accessible to the public; but to wade through the piles of volumes which would require to be searched with regard to any one property situated, for example, in the county of Edinburgh, would be a hopeless task. To assist the public so far in making searches, printed abridgments and indexes are now transmitted to the sheriff-clerks of the respective counties; but as it is not practicable to keep these up to the current date of recording, they cannot be trusted to as affording complete information. The practice therefore is to employ a professional searcher, who possesses a thorough familiarity with the registers, and by the aid of indexes, might on an hour or two's notice give particulars as to the state of the title and burdens. In practice, however, searchers are seldom called upon to supply the information with this urgency. The usual way in which a transaction is settled, when the agents for the parties possess the confidence of each other, is for the seller's agent to give an obligation to produce a 'clear search'—that is, to produce a searcher's certificate that there are no burdens existing over the property—within a month or so. The title of the purchaser is put on the record in the meantime;

and the search which is thereupon procured should shew that there are no bonds over the property remaining undischarged, that the chain of titles by which the seller came to possess the property has no missing link, and will close by shewing that the purchaser has now an absolute right to the property by the recording of his conveyance.

Burdens not appearing in the records for forty years, and not kept up by regular payment of interest or otherwise, are held to be extinguished by prescription, so that a search is rarely made for a longer period; and as a search is usually made on each change of ownership, or when a loan is effected, it is comparatively seldom that a search for the full period of forty years is necessary. A search made at one time serves on any subsequent occasion, merely requiring to be continued from the period it left off.

The expense of making a search varies in the different counties, as the number of deeds recorded are less or more. Thus the charge for a search over property in the county of Edinburgh is three shillings per annum; while in the county of Cromarty one shilling per annum only is charged; there being also in every case a fee payable for the use of books, varying from two shillings to ten shillings according to the length of the period over which the search extends. For properties under the value of five hundred pounds, only half-fees are charged.

Separate registers exist for deeds relating to lands within the ancient boundaries of royal burghs. These are kept by the respective town-clerks, who, except in the larger burghs, usually make such searches as are necessary.

Besides the property registers for counties and burghs, there is also kept at Edinburgh the Register of Inhibitions and Adjudications, a search in which discloses any bankruptcy and certain legal diligence affecting the property or the right of the owner to convey it. The charge for a search in this register is threepence per annum and upwards, according to the number of names searched against, besides a small fee for the use of books.

Of course, the processes of registration just described can be satisfactorily carried out only where a reasonable degree of confidence is reposed in the integrity of the different parties concerned. Where there are solicitors of the Dimsdale type, disposed to be fraudulent, and where due care is not exercised by registrars, it might be difficult to establish an unchallengeable system of public registration of land rights. We have seen it stated in letters in the London prints that compulsory registration would only increase the number of deceptions, and consequently lower the value of titles to property. We put no faith in such apprehensions. Ridiculously loose dealings in title-deeds have encouraged frauds which would probably disappear under peremptory regulations, along with a stern code of punishment.

In consequence of the universality of registration in Scotland, it is not necessary to write deeds in a costly and cumbrous manner upon vellum. Their durability being of little consequence, they are written plainly on paper, foolscap size, easily folded up in a bundle. In that condition they are as a matter of convenience ready for consultation. Should any of them be lost by fire or otherwise, the loss can at all times be made good by the proper registrar. In point of fact, a

man no more thinks of dragging his title-deeds about with him than he does of a certificate of his birth or marriage. Here, there will be observed to be a material difference between the usages of England and Scotland. Title-deeds in England are written in a formal and expensive style on sheep-skins, and are intolerably cumbersome. Their preservation is a matter of great importance, for they may be used as a ready and convenient pawn. Taken to a banker, they are accepted as a security for borrowed money. In this manner they may be employed on all occasions of emergency to raise a sum requisite to tide over a temporary depression of funds. Though in some respects convenient, this practice of handing about title-deeds as securities must be somewhat hazardous, and does not commend itself to ordinary business notions. Yet, if the practice be as common as it is alleged to be, we can imagine how much it stands in the way of any thorough introduction of the Scottish system of registration into England.

The cost of land conveyance in England has long been matter of complaint; and no doubt the process might be simplified and cheapened. Even in Scotland, there is room for some improvement. Any general reform on the subject involves a revision in the 'land laws,' not to be lightly entered upon. One thing is properly to be borne in mind. The cost of land conveyance is prodigiously augmented by stamp duties, for the sake of revenue. A case in point has just come within our experience in Scotland. The cost of conveying a property valued at nine thousand four hundred pounds, and where searches were dispensed with, amounted to one hundred pounds eight shillings and eightpence, in which was included the sum of forty-seven pounds and twopence for a stamp, or nearly a half of the whole. Those who agitate for a modification of the land laws would need to begin with the stamp duties, though involving the trouble of considering how the public service is to be carried on without an equivalent tax being spread over the general community.

The Select Committee of the House of Commons appointed to consider the reforms that might be made as to land transfers in England, has lately issued its Report. Various measures are suggested. But we feel assured that partial modifications will prove unavailing, and only lead to fresh vexations. As the Committee seem to have been conscious of the superiority of the Scottish system, we are surprised that they did not recommend its adoption as a whole. There it was ready to be copied in its entirety, with the advantage of establishing a uniformity of usage over Great Britain. This, however, is the era of small measures and bit-by-bit legislation. A century may elapse before the English are prepared to embrace the usages which have flourished with general approbation for the last three hundred years in Scotland. We have alluded to the circumstance of title-deeds in England being deemed valuable as a pawn for borrowed money. There are other serious obstructions to compulsory registration. The nobility and landed gentry are understood to have an extreme reluctance to give the public an opportunity of knowing their financial encumbrances. The solicitors are said to be equally unwilling to shew deeds in which

flaws may be detected. If such be the case, the difficulties in the way of introducing the Scotch system of registration into England must be nearly insuperable.

W. C.

THE BRAVE SWISS BOY.

FROM THE GERMAN.

CHAPTER I.—THE SWISS PEASANT AND HIS SON.

THE first beams of the morning sun were tipping with fire the jagged and icy peaks of the Wellhorn and Matterhorn, those gigantic monarchs of the Bernese Oberland, when a slender youth came out to the door of a small herdsman's cottage near Meyringen, and looked up at the sky to note the weather.

'We shall have a splendid day, father,' said he, after glancing all round for a few minutes. 'There isn't a cloud to be seen, and the fir-trees sparkle like silver in the morning air.'

'I am glad to hear it, Walter,' replied a powerful voice from inside the cottage, 'for I must cross the hill to Grindelwald to-day to see my cousin. It is a long journey, and much pleasanter in fine weather than in rain and fog. You can go and let out the goats, and look after the cow, for we must milk them before I go.'

'Oh, Liesli is not far off,' was the rejoinder; 'I see her coming along; she is passing Frieshardt's house now. She is a good cow, and always knows when it's milking-time.—But what is that?' he exclaimed after a short pause. 'Frieshardt is driving her into his yard!—Hi, neighbour! what are you doing? Don't you know whom that cow belongs to?'

'Yes; of course I do,' replied the farmer roughly. 'But I've taken a fancy to the cow, and mean to keep her. You can tell your father that, if you like, and say that if he wants her he can come and fetch her.'

'Father, father!' cried the boy, turning round, 'neighbour Frieshardt has taken our cow away. Come and get her back.'

Obedying his son's call, Toni Hirzel hastened out of the cottage just in time to see his neighbour locking the byre upon Liesli, the only cow he possessed. 'Oho, my friend!' he exclaimed, 'what is the meaning of this?'

'Don't you understand, Hirzel?' replied his neighbour in a mocking and sarcastic tone. 'Recollect what you promised me the other day. You have been owing me forty francs since last winter, and said you would pay me yesterday. But as you have forgotten it, I have taken your cow, and mean to keep her till I get the money back.'

Toni Hirzel frowned and bit his lips. 'You know very well,' said he, 'that I have not been able to pay my small debt. My poor wife's illness and funeral cost me a great deal of money; but you know quite well that I am an honest man, and that there is no need for you to behave in such an unkind and unfriendly way towards me. It is not neighbourly, Frieshardt.'

'Neighbourly nonsense!' replied the farmer. 'The cow belongs to me until you pay the money.'

With these words, he turned on his heel and went into his house, the size and general appearance of which bespoke the comfort, if not the

luxury of its owner. With a sad and anxious expression, Toni Hirzel followed him with his eye.

'But father,' said the youth in surprise and anger, 'do you mean quietly to put up with that? I wouldn't suffer it, if I were you.'

'Hush, hush, my boy!' replied his father quietly, 'It is certainly not very kind of Frieshardt to treat a poor neighbour in such a harsh way; but he has the law on his side, for I can't deny that I owe him the money. I should have paid him long ago if it had been possible, but your poor mother's illness and death prevented me. We must have patience. I daresay my cousin will lend me the forty francs if I ask him, and then we shall get our cow back again. Don't be afraid, Watty. You shall see Liesli feeding in the meadow again to-morrow.'

'Yes, that she shall, father,' said the boy in a decided tone. 'She shall be brought back whether you get the money or not. Frieshardt shall give her up to-day, and be thoroughly ashamed into the bargain for his hard-heartedness! He has got forty cows on the hills, and yet robs a poor neighbour of the only one he has got. What harm have we done him, that he should treat us in such a way?'

'I will tell you, Watty, for you are now growing tall and sensible, so that one can talk to you,' replied his father. 'He has envied me the possession of Liesli for a long time, for she is the best cow in the whole neighbourhood; and he offered me two hundred francs for her last autumn. As I wouldn't sell her, he has seized her now, thinking that I can't pay him the money he has lent me. If I were to go to law with him, the cow would be valued, and he would only pay me what she is worth over and above the debt. That is his calculation. But I hope he will soon find that he has made a great mistake.'

'Yes; I hope he will, father,' said the boy. 'Go over to Grindelwald quietly; but don't be annoyed if you can't borrow the money. I tell you that I will get the cow back this very day; and you know, father, that when I say so I mean it.'

'I hope you haven't got any foolish plans in your head, Watty,' said his father. 'It is of no use trying force against our neighbour, for he is to a certain extent in the right.'

'I am not thinking of using force,' said the boy. 'Leave the matter to me, and go quietly on your journey. I know perfectly well what I am going to do, and you may be certain that it is nothing wrong.'

The tall and ruddy youth looked at his father with such a steady and open expression, that all his fears were silenced. 'Well, you are no longer a child, Walter,' said he. 'You were sixteen last May, and ought to have come to years of discretion. But I should very much like to know what plan you have got in your head. Won't you tell me, boy?'

'You shall hear to-night, after you come back, father,' replied Walter, smiling. 'But I assure you again that there is nothing wrong or wicked in it, and give you my hand upon it!'

'Well then, do whatever you have a mind to,' said his father. 'I must not lose any more time, or it will be too late before I get back. Farewell, my boy, and see that you don't play any roguish tricks!'

With these words the peasant took his alpenstock, as the long iron-pointed stick is named which is used for crossing the ice-fields, and set forth.

'Good-bye, my dear father,' said the boy, gazing after him until a turn in the road hid him from view. 'It is better that you should go away quietly and without anxiety. If I had told you what I am going to do, you would have been vexed and nervous, and have tried to turn me from it. But now I shall have nothing to hinder me, and I can set to work in earnest. I will milk the goats first though, that the poor animals may not suffer till I get back.'

Obedient to his loud call the goats came frisking along; and after having relieved them of their milk, Walter drank some, ate a little black bread to it, and then put the rest of the milk in a flat pan, which he set carefully in the cool cellar. When the goats had returned to the hills and were clambering from crag to crag in search of grass and herbage, Walter slung a light hunting-bag across his shoulder, stuck a small axe with a short handle into his belt, and a knife into his pocket; filled a bottle with goat's milk, and then cut off a large hunch of bread and placed it with the bottle in his bag. He then selected a stout alpenstock and tried it carefully, to see if the iron point were sharp and strong. When these preparations were made, he looked for a piece of thin strong cord, such as the chamois-hunters take with them on their dangerous Alpine journeys, put it into his bag beside the bread and milk, and quitted the cottage, the door of which he bolted on the outside.

The cottage was about half-an-hour's walk from the inn on the road from Meyringen to Grindelwald, and thither the stout-hearted youth turned his steps. The sun was still low in the east when he arrived, for it was early in the morning; but a number of horses and mules stood at the door of the inn waiting for their riders. Several guides were loitering about, ready to conduct travellers either to the steep heights lying above the village, down to the beautiful waterfalls of the Reichenbach, or to the village Meyringen.

'Well, Watty Hirzel,' said one of the guides in answer to the boy's salute, 'I suppose you want to earn a couple of francs to-day, as you have come armed with alpenstock and game-bag? You couldn't have chosen a better day! Every room in the inn is full, and you will easily get somebody to take to the glaciers or anywhere else.'

'No, no, Mohrle,' replied the boy; 'I haven't come to take your trade away from you; I only want to speak to Mr Seymour, the gentleman from Scotland who has been staying here for about a month. He hasn't left yet, I hope?'

'No; there he is at the window,' said the guide. 'But you won't be able to earn anything from him; for he knows all the roads of the Oberland as well as any of us. What do you want to speak to him about?'

'You will find that out in the evening perhaps, when you come back,' replied Walter. 'It is a secret at present.'

'Aha, I understand! You have discovered the track of a chamois, and are going to take the gentleman to see if he can get a shot at it. He seems quite mad upon hunting, and I daresay you will get a five-franc piece if you help him.'

'Very likely, Mohrle,' replied the youth, with a laugh; and then bowed to the gentleman, who stood at a window of the inn surveying the lively scene below. Opening the window, he beckoned to the boy, who bowed again, and went into the house.

'He is a sharp boy,' said the guide to one of his companions. 'There are not many lads in the Oberland who are as bold and active in climbing as he is. And no one can beat him for deer-stalking. But it's no wonder, for Toni Hirzel, his father, is the best chamois-hunter in this part of the country.'

'Yes; he is a brave fellow,' was the reply. 'I know his father well. There isn't a cleverer sportsman in the mountains; but it's a dangerous life, and I shouldn't like to change places with him. It is much more comfortable to shew strangers the sights; there is less peril and a great deal more profit in it.'

'And yet I would wager anything that Toni wouldn't change places with us,' replied the first speaker. 'He told me only a week ago that it was impossible to give up the hunting life. "My father and grandfather both lost their lives by it," said he; "and I know I shan't fare any better; but whenever I see the track of a chamois, I must be off after it." That is the way with all your chamois-hunters.'

'Well, may God long preserve him from such an awful death,' said the other. 'But there comes our party. Look after your horse, Mohrle!'

The conversation was thus abruptly cut short. The ladies and gentlemen mounted the animals that were waiting for them, and in a few minutes the space in front of the inn was cleared of the busy throng.

'Now then,' said the young Scotchman, whose attention had been occupied with the company which had just left, and who now turned to Walter. 'Has your father discovered some new tracks, and sent you to tell me?'

'No sir. I have come to ask you if you were in earnest the other day, and if you really wish to have a vulture's brood?'

A vulture's brood, boy?' inquired the Scotchman with eager and sparkling eyes. 'Have you discovered one?'

'Yes sir,' replied the youth. 'I have clambered up among the wild ravines of the Engelhorn for several days, and yesterday I descried a spot where I am pretty certain there is an eyrie. If so, the young birds must be well fledged already; so it won't do to lose much time in getting them.'

'Well go and fetch them then!' exclaimed the gentleman hastily. 'I have set my mind upon having a couple of young vultures.'

'And you shall have them, if Heaven preserves my feet from slipping and my hand from trembling,' said the boy. 'But I must first know what you are willing to give me for the birds.'

'I have already told you that you shall have thirty francs if you bring them here alive.'

Walter shook his head. 'That is not enough, sir,' he replied. 'I can't do it for that. I must have forty francs.'

A smile almost of contempt passed over the lips of Mr Seymour. 'So young, and already so greedy!' said he. 'Begone! I hate avarice, and will rather lose the birds than be cheated in such a way!'

Walter blushed deeply. His feelings were so wounded by these words that his heart swelled as if it would burst, and his eyes filled with tears. But with a vigorous effort he controlled himself and gave a quiet answer. 'It is not greed or avarice that makes me ask for more money. You condemn me unjustly sir.'

'What else then, can it be?' inquired Mr Seymour angrily.

In a few simple words Walter described the harsh conduct of the neighbour who had taken away his father's cow for a debt of forty francs, and said that he had hoped the stranger would readily give the trifling sum of ten francs more if he only knew how dangerous it was to attempt the vulture's eyrie. While he spoke, the angry look gradually disappeared from the traveller's face, and he smiled with friendliness and goodwill upon the boy.

'And you will expose yourself to this danger to serve your father?' he inquired.

'Yes, sir; I have made up my mind to do so.'

'But is it so very dangerous to get at the nest?'

'So dangerous, that I couldn't make up my mind to it yesterday,' replied Walter. 'It is built on one of the steepest crags of the Engelhorn, and can only be reached by a very narrow ridge of rock with dreadful precipices on both sides.'

'And you are going to risk your life to help your father to pay the money he owes?'

'Yes; and I am not afraid, if I can only be sure of the reward.'

'Well then, that alters my opinion. Bring me the young vultures, and the forty francs are yours.'

Walter warmly thanked the liberal stranger for his generosity, and was about to leave the room; but surprised at the boy's courage, and perhaps alarmed at the idea of exposing him to such frightful peril, Mr Seymour called him back.

'I have changed my mind,' said he; 'I really have no use for the birds, at least not at present; and I daresay you will be able to discover another nest that can be got at without so much danger; and to tell you the truth, I don't care about having such young ones. Go quietly home, my boy!—But why do you look so sorrowful and alarmed? Oh, I see; you are afraid of losing the money! No, no; I didn't mean that. Take these two gold coins—they are a present from me—that will just make up the sum that your father wants.'

Walter stood as if thunder-struck, unable to understand such generosity, and thought the stranger was joking with him in giving such a large sum for nothing.

'Take it, my boy—take it,' said Mr Seymour, smiling. 'Your father must and shall be assisted in his difficulty, for he must be a good man to have such a brave and affectionate son. But the life of a human being can't be risked for the sake of a couple of stupid birds.'

In surprise and confusion, Walter took the money, expressed his thankfulness in a few mumbled words and shuffled out of the room. When he reached the open air, he recovered his self-possession to some extent; and holding the gold coins fast in one hand, threw his cap up in

the air with the other, uttered a loud shout of joy, and bounded homewards again at the top of his speed. Having reached the cottage, he put the money in a corner of the cupboard in which his father kept his small stock of cash, locked the door, and put the key in a place of safety, and then left the cottage again.

'Now everything is in first-rate order,' said he to himself. 'Father will be sure to find the money when he comes back, and I shall have plenty of time to see how the vulture's nest is to be got at. Mr Seymour shall have the birds, no matter what trouble and danger it may cost me. He shall soon see that I am neither selfish nor unthankful to him for his generosity.'

GLIMPSES OF LONDON.

'HE who is tired of London is tired of existence,' said Dr Johnson; and Charles Lamb, as ardent a lover of the town, declared to Wordsworth, in a letter written in 1801, that 'London itself, a pantomime and a masquerade,' fed him without the power of satiating him. 'The wonder of these sights impels me into night-walks about her crowded streets, and I often shed tears in the motley Strand, from fullness of joy at so much life.'

We have before us a work in two volumes, by Augustus J. C. Hare, entitled *Walks in London* (Daldy, Isbister, & Co.), giving yet another proof of the inexhaustible interest of the subject of the great metropolis, and how it teems with memories of great names and great historic deeds. While perusing these volumes we can follow our garrulous guide in his excursions; viewing the objects of interest and wandering through all the more interesting streets, listening to his anecdotes, and the literary and historical associations which they call up. In the first volume we are guided through the bustle of the City; in the second, we visit the West End and Westminster.

The very fogs of London, according to Mr Hare, when they are not too thick, may be of service to the artist. London, he affirms, is one of the most picturesque capitals in Europe; no town is better supplied with greenery; the parks are full of beauty. The best of the country-produce flows into town, the result being that the Cockney has the advantage over the countryman in being able to indulge in better strawberries, cherries, and vegetables, than may be had elsewhere. The population of London alone is greater than that of the whole of Denmark or Switzerland, and nearly as great as that of the whole of Scotland. The town has been travelling westward since the time of the Plantagenets; always moving into the country, and never halting there. To see London properly, we are told that we must see the excited crowds at the Stock Exchange, the Banks, and the Guildhall; the Post-office, with its intricate arrangements, and the crowds which stream along Cheapside, Cornhill, and Great Tower Street on a week-day. Or we must descend the Thames from Vauxhall Bridge, and gain an idea of the

river-traffic; and ascend the Monument. Those who find the parks monotonous, our author suggests, might refresh both mind and body by mornings spent amongst the tombs at Westminster, in visiting the famous picture-galleries, or in treading, as he has done, some of the ancient City by-ways.

Beginning with Charing Cross—a place of great attraction to all visitors—it is curious to remark that the finest statue in London, that of Charles I., the work of Hubert le Sueur, was sold by parliament to a brazier, with orders that it should be broken up. Instead of doing so, the ingenious tradesman hid the statue, and made a large sum of money by selling brass handles for knives ostensibly made from it. At the Restoration it was mounted on its present pedestal. Harry Vane the Younger lived at Charing Cross; Isaac Barrow died over a saddler's shop here in 1677; and in a lane close by lived the mother of Ben Jonson. John Evelyn lived several years in Villiers Street, by the side of Charing Cross Station. The Strand—so called because of its following the *strand*, the shore of the Thames—was at one time popular with the aristocracy on account of its being the highway from the royal palace at Westminster to the royal palace on the Fleet. Beyond the gardens of York House, on the same side of the river, once ranged the houses of the great nobles. In Adelphi Terrace died Garrick the actor, and the witty Topham Beauclerk.

In Exeter House near the Strand, lived and died Lord Burleigh. Elizabeth visiting him in a head-dress so high that she could not enter the door, was asked by the servant to stoop. 'I will stoop for your master,' was the reply, 'but not for the king of Spain.' Lord Burleigh apologising for his inability to stand up, owing to an infirmity of his legs, she replied: 'My lord, we do not make use of you for the badness of your legs, but for the goodness of your head.' While the Savoy Palace, in the neighbourhood of the Strand, was the residence of John of Gaunt, the poet Chaucer was married there to Philippa de Ruet, a lady in the household of the Duchess of Lancaster. In the church of St Clement Danes sat Dr Johnson, when 'repeating the responses in the Litany with tremulous energy;' and there also in his seventy-fifth year he returned public thanks for recovery from illness. In Norfolk Street lodged Peter the Great, when in England; also William Penn, who had a peeping-hole in order to survey all who entered.

William Congreve the dramatist lived and died in Surrey Street. In Essex Street, Prince Charles Edward lived for five days in September 1750, at the house of Lady Primrose. Here also Flora Macdonald found an asylum after her release by the government. Temple Bar, so recently removed, was built in 1670, Christopher Wren being the architect. It was customary in those days to exhibit the heads of political offenders after their execution, the last exposed being those of certain noblemen and others who were concerned in the rebellion of 1745. The spikes supporting the heads were only removed within the century. In front of the bar, Titus Oates, standing in the pillory, was pelted with dead cats and rotten eggs; while Daniel Defoe, placed in the same position for a libel on the government, received an ovation from the people; his health

was drunk, and the pillory was hung with flowers. Close to the bustle of Fleet Street, yet removed from it, stand the Inns of Court. Thither the Knights Templars removed in 1184, and many of the peculiar terms used by them have descended to these times. Chaucer was one of the students of the Middle Temple in the time of Edward III. The Temple Church is the only original relic of the residence of the Knights Templars. A white marble monument exists in the interior of the church to John Selden, styled by Milton 'the chief of learned men reputed in this land.' By the side of a paved walk leading along the north side of the church there is a simple monument to the author of the *Vicar of Wakefield*, bearing this plain inscription: 'Here lies Oliver Goldsmith.'

Crown Office Row, in the vicinity of the Temple, was the birthplace of Charles Lamb. In prospect of taking lodgings in King's Bench Walk, he wrote: 'I shall be airy, up four pair of steps, as in the country; and in a garden, in the midst of enchanting, more than Mahometan paradise, London, whose dirtiest, drab-frequented alley, and her lowest bowing tradesman, I would not exchange for Skiddaw, Helvellyn, James, Walter, and the parson into the bargain.' The learned Blackstone, whilst writing the fourth volume of his *Commentaries* on the first floor of No. 2 Brick Court, was much disturbed by the roaring comic songs, games, and supper-parties indulged in by Oliver Goldsmith, who occupied the rooms above him. And here Goldsmith, dreadfully in debt, died on April 9, 1774.

Gray's Inn—which derives its name from the family of Gray de Wilton—is the fourth Inn of Court of importance; there Lord Bacon wrote his *Norrum Organum*. Of the trees originally planted by Lord Bacon in the gardens, none is remaining. Thither came Pepys when the place was a fashionable promenade: 'When church was done, my wife and I walked to Graye's Inn, to observe the fashions of the ladies, because of my wife's making some clothes.' The four Inns of Court have thus been characterised:

Gray's Inn for walks, Lincoln's Inn for wall,
The Inner Temple for a garden, and the Middle
for a hall.

Child's Bank in Fleet Street dates from the time of Charles I., and is one of the oldest banking houses in England. Charles II., Nell Gwynne, Prince Rupert, Pepys, Dryden, and others dealt with this bank. Next door to the bank once stood the *Devil's Tavern*, which was patronised by Ben Jonson, and in turn by Swift, Addison, and Dr Johnson. It is said that Jack Sheppard found the *Bible Tavern* in Shire Lane very convenient for his orgies, as it possessed a trap-door by which he could escape when disturbed. The *Cock Tavern*, No. 201 Fleet Street—the meeting-place of the most celebrated wits and scholars of the last two centuries—remains internally unaltered since the time of James I. Dryden and Otway lived opposite each other in Fetter Lane, and used to quarrel in verse. On the left of this Lane stands the new Record Office; one of the greatest of the many valuable documents it contains being the Domesday Book, in two volumes in vellum, written in the time of William the Conqueror. Fleet Street has many associations with Dr John-

son; Boswell met him frequently in the *Mitre Tavern*; his wife died in Gough Square, where the greater part of his Dictionary was written, and where the *Rambler* and the *Idler* were begun; and in No. 8 Bolt Court died the lexicographer, surrounded by many pensioners on his bounty. One of the many generous acts of Johnson's life was his visit to Goldsmith when the latter resided in Wine Office Court. Finding the author pressed for money, Johnson disposed of the manuscript of a novel his needy friend had written, to Newberry for sixty pounds. The manuscript lay neglected for two years, when it was given to the world as the *Vicar of Wakefield*. In Gunpowder Alley, an offshoot of Shoe Lane, Richard Lovelace the Cavalier poet died from starvation. In Salisbury Court, Samuel Richardson wrote and printed his *Pamela*; and there also Goldsmith acted as his press corrector. John Milton wrote his treatises *Of Reformation*, *Of Practical Episcopacy*, and others in the house of one Russell, a tailor in St Bride's Churchyard, where he lodged in 1643. Here he whipped and instructed his sister's two boys, and thither he brought his royalist wife, Mrs Mary Powell, who found life here so quiet and 'so irksome to her, that she went away to her parents at Forest Hill,' from which, however, she afterwards returned.

The Old cathedral of St Paul's was five times burnt—thrice by lightning. The new building, begun under Christopher Wren in 1675, cost, we are exactly informed, seven hundred and forty-seven thousand nine hundred and fifty-four pounds two shillings and ninepence. The money was raised by a tax on every chaldron of coals brought into the port of London, and this fact alone, it has been said, gives it a right to its smoke-blackened appearance. Relics of three different ages were found when its foundations were laid—Saxon coffins and tombs, British graves, and all the evidences of the existence of a Roman cemetery. Great historic tombs and monuments, including those of Lord Nelson and the Duke of Wellington, are amongst its chief objects of interest. St Paul's School was founded in 1514 by Dean Colet; there Milton was educated from his eleventh to his sixteenth year. In the Heralds' College, near St Paul's Churchyard, were deposited the sword, dagger, and turquoise ring of James IV. of Scotland, who was slain at Flodden. Before the Great Fire of London, St Paul's Churchyard was the great headquarters of the booksellers. Now Paternoster Row is sacred to the profession.

Christ's Hospital (the Blue-coat School), founded by Edward VI. on the site of the monastery of Gray Friars, for destitute and fatherless children, has been the *alma mater* of many eminent men, notably Coleridge and Charles Lamb in recent times. The library was founded by the celebrated Sir Richard Whittington. The new meat-market at Smithfield, in Mr Hare's words, 'is a perfect forest of slaughtered calves, pigs, and sheep, hanging from cast-iron balustrades—actually seventy-five acres of meat.' Cheapside is celebrated in history as having been the scene of many a conflict between the City 'prentices. Between Bread Street and Friday Street stood the *Mermaid Tavern*, founded by Ben Jonson in 1603, and which numbered Shakspeare, Beaumont, Fletcher, Donne, Selden, &c. amongst its members.

Little Britain, Aldersgate—so called because of

the mansion of John, Duke of Bretagne and Earl of Richmond—was a great bookselling centre in the time of the Stuarts. Wandering amongst the bookstalls there, the Earl of Dorset is said to have discovered a copy of *Paradise Lost*, which he purchased. The bookseller asked him to recommend it if he approved of it, as he had other copies on hand which seemed unsaleable. Shewing it to Dryden, the poet remarked: 'This man cuts us all out, and the ancients too.' After his removal from St Bride's Churchyard, Milton lived in a 'pretty garden-house' in Aldersgate Street, removing to Jewin Street in 1661, where he married his third wife. Here he gave lessons to Ellwood the Quaker, in the foreign pronunciation of Latin. In St Giles Church, Cripplegate, Milton was buried in 1674. His bones were exhumed in 1790, his teeth extracted, and carried off by the churchwardens; and for many years the mutilated skeleton was exhibited to the public at twopence and threepence a head! Fox the martyrologist is buried here. In the parish register is recorded the marriage of Oliver Cromwell and Elizabeth Bowchier, August 20, 1620. In Bishopsgate Street is Crosby Hall, built by Sir John Crosby, alderman of the City of London in 1461. Mr Hare considers this place, even with its late lath-and-plaster front to the street, as one of the most beautiful specimens of domestic architecture left in London, and one of the best examples of fifteenth-century work in England.

The royal palace of Whitehall attained its greatest measure of splendour under Charles I. Court pleasures were organised regardless of expense; poetry, painting, music, and architecture were all liberally patronised. In the Banqueting House the hospitalities were on the most gigantic scale. The king's household consumed yearly, amongst other meats, fifteen hundred oxen, seven thousand sheep, twelve hundred calves, three hundred porkers, six thousand eight hundred lambs, three hundred fitches of bacon, and twenty-six boars. The list is so alarming that we give only these further items of consumption: one hundred and forty dozen of geese, fourteen hundred and seventy dozen of chickens; in the shape of bread, three hundred and sixty-four thousand bushels of wheat were used; in drink—six hundred tuns of wine, and seventeen hundred tuns of beer. On the morning of the execution of Charles I., the 30th January 1649, the king was in the Cabinet Chamber overlooking the Privy Garden, waiting until the scaffold was ready. Here he prayed and conversed with Bishop Juxon, and ate some bread and drank some claret; and while doing so, Cromwell, in a distant small room, was signing the warrant for his execution. Cromwell when installed Lord Protector of the Commonwealth, took up rooms in Whitehall, and employed Milton to act as his private secretary. Here too, Cromwell died while a great storm was raging in the Park, on September 3, 1658. Charles II. revived the reign of pleasure at Whitehall, and died there on February 6, 1685. But with the flight of James II. and the entrance of the Dutch troops into London, the glory of the place passed away.

Regarding the Tower, Westminster, Whitehall, Holland House, and all the well-known and less-known nooks and by-ways of London, the reader will find in Mr Hare's volumes a mine of interesting information. Where possible, he has

quoted largely the opinions of men of eminence, historical, biographical, and topographical, and has enriched his volumes by woodcut engravings of the more picturesque localities.

THE MYSTERY OF SASASSA VALLEY.

A SOUTH AFRICAN STORY.

Do I know why Tom Donahue is called 'Lucky Tom?' Yes; I do; and that is more than one in ten of those who call him so can say. I have knocked about a deal in my time, and seen some strange sights, but none stranger than the way in which Tom gained that sobriquet and his fortune with it. For I was with him at the time.—Tell it? Oh, certainly; but it is a longish story and a very strange one; so fill up your glass again, and light another cigar while I try to reel it off. Yes; a very strange one; beats some fairy stories I have heard; but it's true sir, every word of it. There are men alive at Cape Colony now who'll remember it and confirm what I say. Many a time has the tale been told round the fire in Boers' cabins from Orange State to Griqualand; yes, and out in the Bush and at the Diamond Fields too.

I'm roughish now sir; but I was entered at the Middle Temple once, and studied for the Bar. Tom—worse luck!—was one of my fellow-students; and a wildish time we had of it, until at last our finances ran short, and we were compelled to give up our so-called studies, and look about for some part of the world where two young fellows with strong arms and sound constitutions might make their mark. In those days the tide of emigration had scarcely begun to set in towards Africa, and so we thought our best chance would be down at Cape Colony. Well—to make a long story short—we set sail, and were deposited in Cape Town with less than five pounds in our pockets; and there we parted. We each tried our hands at many things, and had ups and downs; but when, at the end of three years, chance led each of us up-country and we met again, we were, I regret to say, in almost as bad a plight as when we started.

Well, this was not much of a commencement; and very disheartened we were, so disheartened that Tom spoke of going back to England and getting a clerkship. For you see we didn't know that we had played out all our small cards, and that the trumps were going to turn up. No; we thought our 'hands' were bad all through. It was a very lonely part of the country that we were in, inhabited by a few scattered farmers, whose houses were stockaded and fenced in to defend them against the Kaffirs. Tom Donahue and I had a little hut right out in the Bush; but we were known to possess nothing, and to be handy with our revolvers, so we had little to fear. There we waited, doing odd jobs, and hoping that something would turn up. Well, after we had been there about a month something did turn up upon a certain night, something which was the making of both of us; and it's about that night sir, that I'm going to tell you. I remember it well. The wind was howling past our cabin, and the rain threatened to burst in our rude window. We had a great wood-fire crackling and sputtering on the

hearth, by which I was sitting mending a whip, while Tom was lying in his bunk groaning disconsolately at the chance which had led him to such a place.

'Cheer up, Tom--cheer up,' said I. 'No man ever knows what may be awaiting him.'

'Ill-luck, ill-luck, Jack,' he answered. 'I always was an unlucky dog. Here have I been three years in this abominable country; and I see lads fresh from England jingling the money in their pockets, while I am as poor as when I landed. Ah, Jack, if you want to keep your head above water, old friend, you must try your fortune away from me.'

'Nonsense, Tom; you're down in your luck to-night. But hark! Here's some one coming outside. Dick Wharton, by the tread; he'll rouse you, if any man can.'

Even as I spoke the door was flung open, and honest Dick Wharton, with the water pouring from him, stepped in, his hearty red face looming through the haze like a harvest-moon. He shook himself, and after greeting us sat down by the fire to warm himself.

'Whereaway, Dick, on such a night as this?' said I. 'You'll find the rheumatism a worse foe than the Kaffirs, unless you keep more regular hours.'

Dick was looking unusually serious, almost frightened, one would say, if one did not know the man. 'Had to go,' he replied--'had to go. One of Madison's cattle was seen straying down Sasassa Valley, and of course none of our blacks would go down *that* Valley at night; and if we had waited till morning, the brute would have been in Kaffirland.'

'Why wouldn't they go down Sasassa Valley at night?' asked Tom.

'Kaffirs, I suppose,' said I.

'Ghosts,' said Dick.

We both laughed.

'I suppose they didn't give such a matter-of-fact fellow as you a sight of their charms?' said Tom from the bunk.

'Yes,' said Dick seriously--'yes; I saw what the niggers talk about; and I promise you, lads, I don't want ever to see it again.'

Tom sat up in his bed. 'Nonsense, Dick; you're joking, man! Come, tell us all about it. The legend first, and your own experience afterwards.--Pass him over the bottle, Jack.'

'Well, as to the legend,' began Dick--'it seems that the niggers have had it handed down to them that that Sasassa Valley is haunted by a frightful fiend. Hunters and wanderers passing down the defile have seen its glowing eyes under the shadows of the cliff; and the story goes that whoever has chanced to encounter that baleful glare, has had his after-life blighted by the malignant power of this creature. Whether that be true or not,' continued Dick ruefully, 'I may have an opportunity of judging for myself.'

'Go on, Dick--go on,' cried Tom. 'Let's hear about what you saw.'

'Well, I was groping down the Valley, looking for that cow of Madison's, and I had, I suppose, got half-way down, where a black craggy cliff juts into the ravine on the right, when I halted to have a pull at my flask. I had my eye fixed at the time upon the projecting cliff I have mentioned, and noticed nothing unusual about it. I

then put up my flask and took a step or two forward, when in a moment there burst apparently from the base of the rock, about eight feet from the ground and a hundred yards from me, a strange lurid glare, flickering and oscillating, gradually dying away and then reappearing again.--No, no; I've seen many a glow-worm and firefly--nothing of that sort. There it was burning away, and I suppose I gazed at it, trembling in every limb, for fully ten minutes. Then I took a step forwards, when instantly it vanished, vanished like a candle blown out. I stepped back again; but it was some time before I could find the exact spot and position from which it was visible. At last, there it was, the weird reddish light, flickering away as before. Then I screwed up my courage, and made for the rock; but the ground was so uneven that it was impossible to steer straight; and though I walked along the whole base of the cliff, I could see nothing. Then I made tracks for home; and I can tell you, boys, that until you remarked it, I never knew it was raining, the whole way along.--But hollo! what's the matter with Tom?'

What indeed? Tom was now sitting with his legs over the side of the bunk, and his whole face betraying excitement so intense as to be almost painful. 'The fiend would have two eyes. How many lights did you see, Dick? Speak out!'

'Only one.'

'Hurrah!' cried Tom--'that's better!' Whereupon he kicked the blankets into the middle of the room, and began pacing up and down with long feverish strides. Suddenly he stopped opposite Dick, and laid his hand upon his shoulder: 'I say, Dick, could we get to Sasassa Valley before sunrise?'

'Scarcely,' said Dick.

'Well, look here; we are old friends, Dick Wharton, you and I. Now, don't you tell any other man what you have told us, for a week. You'll promise that; won't you?'

I could see by the look on Dick's face as he acquiesced that he considered poor Tom to be mad; and indeed I was myself completely mystified by his conduct. I had, however, seen so many proofs of my friend's good sense and quickness of apprehension, that I thought it quite possible that Wharton's story had had a meaning in his eyes which I was too obtuse to take in.

All night Tom Donahue was greatly excited, and when Wharton left he begged him to remember his promise, and also elicited from him a description of the exact spot at which he had seen the apparition, as well as the hour at which it appeared. After his departure, which must have been about four in the morning, I turned into my bunk and watched Tom sitting by the fire splicing two sticks together, until I fell asleep. I suppose I must have slept about two hours; but when I awoke, Tom was still sitting working away in almost the same position. He had fixed the one stick across the top of the other so as to form a rough T, and was now busy in fitting a smaller stick into the angle between them, by manipulating which, the cross one could be either cocked up or depressed to any extent. He had cut notches too in the perpendicular stick, so that by the aid of the small prop, the cross one could be kept in any position for an indefinite time.

'Look here, Jack!' he cried, whenever he saw

that I was awake. 'Come, and give me your opinion. Suppose I put this cross-stick pointing straight at a thing, and arranged this small one so as to keep it so, and left it, I could find that thing again if I wanted it—don't you think I could, Jack—don't you think so?' he continued nervously, clutching me by the arm.

'Well,' I answered, 'it would depend on how far off the thing was, and how accurately it was pointed. If it were any distance, I'd cut sights on your cross-stick; then a string tied to the end of it, and held in a plumb-line forwards, would lead you pretty near what you wanted. But surely, Tom, you don't intend to localise the ghost in that way?'

'You'll see to-night, old friend—you'll see to-night. I'll carry this to the Sasassa Valley. You get the loan of Madison's crowbar, and come with me; but mind you tell no man where you are going, or what you want it for.'

All day Tom was walking up and down the room, or working hard at the apparatus. His eyes were glistening, his cheek hectic, and he had all the symptoms of high fever. 'Heaven grant that Dick's diagnosis be not correct!' I thought, as I returned with the crowbar; and yet, as evening drew near, I found myself imperceptibly sharing the excitement.

About six o'clock Tom sprang to his feet and seized his sticks. 'I can stand it no longer, Jack,' he cried; 'up with your crowbar, and hey for Sasassa Valley! To-night's work, my lad, will either make us or mar us! Take your six-shooter, in case we meet the Kaffirs. I daren't take mine, Jack,' he continued, putting his hands upon my shoulders—'I daren't take mine; for if my ill-luck sticks to me to-night, I don't know what I might not do with it.'

Well, having filled our pockets with provisions, we set out, and as we took our wearisome way towards the Sasassa Valley, I frequently attempted to elicit from my companion some clue as to his intentions. But his only answer was: 'Let us hurry on, Jack. Who knows how many have heard of Wharton's adventure by this time! Let us hurry on, or we may not be first in the field!'

Well sir, we struggled on through the hills for a matter of ten miles; till at last, after descending a crag, we saw opening out in front of us a ravine so sombre and dark that it might have been the gate of Hades itself; cliffs many hundred feet high shut in on every side the gloomy boulder-studded passage which led through the haunted defile into Kaffirland. The moon rising above the crags, threw into strong relief the rough irregular pinnacles of rock by which they were topped, while all below was dark as Erebus.

'The Sasassa Valley?' said I.

'Yes,' said Tom.

I looked at him. He was calm now; the flush and feverishness had passed away; his actions were deliberate and slow. Yet there was a certain rigidity in his face and glitter in his eye which shewed that a crisis had come.

We entered the pass, stumbling along amid the great boulders. Suddenly I heard a short quick exclamation from Tom. 'That's the crag!' he cried, pointing to a great mass looming before us in the darkness. 'Now, Jack, for any favour use your eyes! We're about a hundred yards from that cliff, I take it; so you move slowly

towards one side, and I'll do the same towards the other. When you see anything, stop, and call out. Don't take more than twelve inches in a step, and keep your eye fixed on the cliff about eight feet from the ground. Are you ready?'

'Yes.' I was even more excited than Tom by this time. What his intention or object was, I could not conjecture, beyond that he wanted to examine by daylight the part of the cliff from which the light came. Yet the influence of the romantic situation and of my companion's suppressed excitement was so great, that I could feel the blood coursing through my veins and count the pulses throbbing at my temples.

'Start!' cried Tom; and we moved off, he to the right, I to the left, each with our eyes fixed intently on the base of the crag. I had moved perhaps twenty feet, when in a moment it burst upon me. Through the growing darkness there shone a small ruddy glowing point, the light from which waned and increased, flickered and oscillated, each change producing a more weird effect than the last. The old Kaffir superstition came into my mind, and I felt a cold shudder pass over me. In my excitement, I stepped a pace backwards, when instantly the light went out, leaving utter darkness in its place; but when I advanced again, there was the ruddy glare glowing from the base of the cliff. 'Tom, Tom!' I cried.

'Ay, ay!' I heard him exclaim, as he hurried over towards me.

'There it is—there, up against the cliff!'

Tom was at my elbow. 'I see nothing,' said he.

'Why, there, there, man, in front of you!' I stepped to the right as I spoke, when the light instantly vanished from my eyes.

But from Tom's ejaculations of delight it was clear that from my former position it was visible to him also. 'Jack,' he cried, as he turned and wrung my hand—'Jack, you and I can never complain of our luck again. Now heap up a few stones where we are standing.—That's right. Now we must fix my sign-post firmly in at the top. There! It would take a strong wind to blow that down; and we only need it to hold out till morning. O Jack, my boy, to think that only yesterday we were talking of becoming clerks, and you saying that no man knew what was awaiting him too! By Jove, Jack, it would make a good story!'

By this time we had firmly fixed the perpendicular stick in between two large stones; and Tom bent down and peered along the horizontal one. For fully a quarter of an hour he was alternately raising and depressing it, until at last, with a sigh of satisfaction, he fixed the prop into the angle, and stood up. 'Look along, Jack,' he said. 'You have as straight an eye to take a sight as any man I know of.'

I looked along. There, beyond the further sight was the ruddy scintillating speck, apparently at the end of the stick itself, so accurately had it been adjusted.

'And now, my boy,' said Tom, 'let's have some supper, and a sleep. There's nothing more to be done to-night; but we'll need all our wits and strength to-morrow. Get some sticks, and kindle a fire here, and then we'll be able to keep an eye on our signal-post, and see that nothing happens to it during the night.'

Well sir, we kindled a fire, and had supper with the Sasassa demon's eye rolling and glowing in front of us the whole night through. Not always in the same place though; for after supper, when I glanced along the sights to have another look at it, it was nowhere to be seen. The information did not, however, seem to disturb Tom in any way. He merely remarked: 'It's the moon, not the thing, that has shifted;' and coiling himself up, went to sleep.

By early dawn we were both up, and gazing along our pointer at the cliff; but we could make out nothing save the one dead monotonous slaty surface, rougher perhaps at the part we were examining than elsewhere, but otherwise presenting nothing remarkable.

'Now for your idea, Jack!' said Tom Donahue, unwinding a long thin cord from round his waist. 'You fasten it, and guide me while I take the other end.' So saying he walked off to the base of the cliff, holding one end of the cord, while I drew the other taut, and wound it round the middle of the horizontal stick, passing it through the sight at the end. By this means I could direct Tom to the right or left, until we had our string stretching from the point of attachment, through the sight, and on to the rock, which it struck about eight feet from the ground. Tom drew a chalk circle of about three feet diameter round the spot, and then called to me to come and join him. 'We've managed this business together, Jack,' he said, 'and we'll find what we are to find, together.' The circle he had drawn embraced a part of the rock smoother than the rest, save that about the centre there were a few rough protuberances or knobs. One of these Tom pointed to with a cry of delight. It was a roughish brownish mass about the size of a man's closed fist, and looking like a bit of dirty glass let into the wall of the cliff. 'That's it!' he cried—'that's it!'

'That's what?'

'Why, man, a *diamond*, and such a one as there isn't a monarch in Europe but would envy Tom Donahue the possession of. Up with your crowbar, and we'll soon exorcise the demon of Sasassa Valley!'

I was so astounded that for a moment I stood speechless with surprise, gazing at the treasure which had so unexpectedly fallen into our hands.

'Here, hand me the crowbar,' said Tom. 'Now, by using this little round knob which projects from the cliff here, as a fulcrum, we may be able to lever it off.—Yes; there it goes. I never thought it could have come so easily. Now, Jack, the sooner we get back to our hut and then down to Cape Town, the better.'

We wrapped up our treasure, and made our way across the hills, towards home. On the way, Tom told me how, while a law-student in the Middle Temple, he had come upon a dusty pamphlet in the library, by one Jans van Hounym, which told of an experience very similar to ours, which had befallen that worthy Dutchman in the latter part of the seventeenth century, and which resulted in the discovery of a luminous diamond. This tale it was which had come into Tom's head as he listened to honest Dick Wharton's ghost-story; while the means which he had adopted to verify his supposition sprang from his own fertile Irish brain.

'We'll take it down to Cape Town,' continued

Tom, 'and if we can't dispose of it with advantage there, it will be worth our while to ship for London with it. Let us go along to Madison's first, though; he knows something of these things, and can perhaps give us some idea of what we may consider a fair price for our treasure.'

We turned off from the track accordingly, before reaching our hut, and kept along the narrow path leading to Madison's farm. He was at lunch when we entered; and in a minute we were seated at each side of him, enjoying South African hospitality.

'Well,' he said, after the servants were gone, 'what's in the wind now? I see you have something to say to me. What is it?'

Tom produced his packet, and solemnly untied the handkerchiefs which enveloped it. 'There!' he said, putting his crystal on the table; 'what would you say was a fair price for that?'

Madison took it up and examined it critically. 'Well,' he said, laying it down again, 'in its crude state about twelve shillings per ton.'

'Twelve shillings!' cried Tom, starting to his feet. 'Don't you see what it is?'

'Rock-salt!'

'Rock fiddle; a diamond.'

'Taste it!' said Madison.

Tom put it to his lips, dashed it down with a dreadful exclamation, and rushed out of the room.

I felt sad and disappointed enough myself; but presently remembering what Tom had said about the pistol, I, too, left the house, and made for the hut, leaving Madison open-mouthed with astonishment. When I got in, I found Tom lying in his bunk with his face to the wall, too dispirited apparently to answer my consolations. Anathematising Dick and Madison, the Sasassa demon, and everything else, I strolled out of the hut, and refreshed myself with a pipe after our wearisome adventure. I was about fifty yards away from the hut, when I heard issuing from it the sound which of all others I least expected to hear. Had it been a groan or an oath, I should have taken it as a matter of course; but the sound which caused me to stop and take the pipe out of my mouth was a hearty roar of laughter! Next moment, Tom himself emerged from the door, his whole face radiant with delight. 'Game for another ten-mile walk, old fellow?'

'What! for another lump of rock-salt, at twelve shillings a ton?'

'No more of that, Hal, an you love me,' grinned Tom. 'Now look here, Jack. What blessed fools we are to be so floored by a trifle! Just sit on this stump for five minutes, and I'll make it as clear as daylight. You've seen many a lump of rock-salt stuck in a crag, and so have I, though we did make such a mull of this one. Now, Jack, did any of the pieces you have ever seen shine in the darkness brighter than any fire-fly?'

'Well, I can't say they ever did.'

'I'd venture to prophesy that if we waited until night, which we won't do, we would see that light still glimmering among the rocks. Therefore, Jack, when we took away this worthless salt, we took the wrong crystal. It is no very strange thing in these hills that a piece of rock-salt should be lying within a foot of a diamond. It caught our eyes, and we were excited, and so we made fools of ourselves, and left the real

stone behind. Depend upon it, Jack, the Sasassa gem is lying within that magic circle of chalk upon the face of yonder cliff. Come, old fellow, light your pipe and stow your revolver, and we'll be off before that fellow Madison has time to put two and two together.'

I don't know that I was very sanguine this time. I had begun in fact to look upon the diamond as a most unmitigated nuisance. However, rather than throw a damper on Tom's expectations, I announced myself eager to start. What a walk it was! Tom was always a good mountaineer, but his excitement seemed to lend him wings that day, while I scrambled along after him as best I could. When we got within half a mile he broke into the 'double,' and never pulled up until he reached the round white circle upon the cliff. Poor old Tom! when I came up, his mood had changed, and he was standing with his hands in his pockets, gazing vacantly before him with a rueful countenance.

'Look!' he said—'look!' and he pointed at the cliff. Not a sign of anything in the least resembling a diamond there. The circle included nothing but flat slate-coloured stone, with one large hole, where we had extracted the rock-salt, and one or two smaller depressions. No sign of the gem.

'I've been over every inch of it,' said poor Tom. 'It's not there. Some one has been here and noticed the chalk, and taken it. Come home, Jack; I feel sick and tired. Oh! had any man ever luck like mine!'

I turned to go, but took one last look at the cliff first. Tom was already ten paces off.

'Hollo!' I cried, 'don't you see any change in that circle since yesterday?'

'What d'ye mean?' said Tom.

'Don't you miss a thing that was there before?'

'The rock-salt?' said Tom.

'No; but the little round knob that we used for a fulcrum. I suppose we must have wrenched it off in using the lever. Let's have a look at what it's made of.'

Accordingly, at the foot of the cliff we searched about among the loose stones.

'Here you are, Jack! We've done it at last! We're made men!'

I turned round, and there was Tom radiant with delight, and with a little corner of black rock in his hand. At first sight it seemed to be merely a chip from the cliff; but near the base there was projecting from it an object which Tom was now exultingly pointing out. It looked at first something like a glass eye; but there was a depth and brilliancy about it such as glass never exhibited. There was no mistake this time; we had certainly got possession of a jewel of great value; and with light hearts we turned from the valley, bearing away with us the 'fiend' which had so long reigned there.

There sir; I've span my story out too long, and tired you perhaps. You see when I get talking of those rough old days, I kind of see the little cabin again, and the brook beside it, and the bush around, and seem to hear Tom's honest voice once more. There's little for me to say now. We prospered on the gem. Tom Donahue, as you know, has set up here, and is well known about town. I have done well, farming and ostrich-raising in Africa. We set old Dick Wharton up

in business, and he is one of our nearest neighbours. If you should ever be coming up our way sir, you'll not forget to ask for Jack Turnbull—Jack Turnbull of Sasassa Farm.

FLIRTS AND FLIRTATION.

BY A LADY.

FLIRTATION, strictly defined, is the effort to attract particular attention from the opposite sex by any means, lawful or unlawful; by flatteries, either subtle or gross—according to the tact or taste of the artist—by dress, attitudes, and airs. This, and seeking the society of men, on the part of girls, and adopting a completely different manner towards the two sexes. Accepting this, then, as the true definition of the term, we must be understood, throughout the following remarks, to speak only of what is *unmitigatedly evil* in the practice. What often passes under the name of *harmless* flirtation with those who use it, is not flirting at all, but is merely the pleasant, free, frank intercourse between young men and women with unoccupied hearts, without which society could not get on, as long as the sexes do not live apart in priories or convents. This we would be very far indeed from condemning. In true flirtation there is always the element of coquetry, which entirely separates it from any other kind of intercourse between the sexes.

Flirtation may be called a game between two people, carried on, as the Germans say, 'unter vier Augen' (under four eyes).

In some cases, but not often, the game develops affection on both sides, or only on one; and when the latter, it must very quickly come to an end, after perhaps much suffering, especially if the attachment be on the woman's side. Flirting seems to be indulged in by most young people as their way of life, sometimes for the mere pleasure of it, or for the gratification of vanity and love of conquest, but more often with the ulterior design on the part of women of securing a husband. Men as a rule are not so given to aimless flirtations as women. They are either passably indifferent to most of the girls they meet, or else fall violently in love with one or another, from time to time, so that they have at least the merit of being, or believing themselves to be sincere, while the fancy lasts. With men, moreover, flirtation lacks the obnoxious element of indelicacy, which is usually inseparable from the same practice in a woman. She should always be the wooed, never the wooer. If a pleasurable, flirting is also an exhausting excitement, and requires great pains on a woman's part, unless she be what is termed a finished coquette, an adept in the art, who exercises it from mere love of power; though she may not have the smallest special regard for the individual man at the time being, and would perhaps repulse any serious demonstration on his part.

This kind of flirting is not very often met with in real life. It seems chiefly confined to the heroines of sensational novels and verse. The more commonplace style is that of the girl who flirts merely because it seems 'the thing' to do, or because others do it, or that she may be admired, or have a beau, or get settled in life. How much of really enjoyable intercourse with men do girls deprive themselves of, by this almost invariable intro-

duction of flirting into all society-talk. There are some men—and they are the best sort—who do not care for ceaseless flirting or ‘chaffing;’ and there are many others who are afraid, in these days of practical young ladies, of being entrapped into a marriage or a ‘breach of promise case,’ if they seem to like the society of any specially attractive girl, whom they may fancy to talk to, but towards whom they have no serious intentions. Such men would sometimes feel it a relief to meet a girl with whom they might feel safe, at least from matrimonial designs.

It would be well perhaps to say what flirting is *not*, lest we should be thought to advocate prudery. No intercourse between the sexes should be classed as flirting, after the element of real love has entered into it. ‘All is fair in love’—certainly in mutual and declared love, or even undeclared, when a woman is sure of her standing in the man’s estimation. There is nothing more hateful and unwomanly than ultra-prudery. The cold, proper ‘Lady Byron’ type of woman has, one might almost venture to say, destroyed the happiness of as many men as the coquette. If a girl were to bestow as many of her little gracious smiles on her acknowledged lover, and to take as much pains to retain his admiration as to gain that of the indifferent, and if young wives did the same, even calling in the aid of such small attractions as dress, there would be a good many happier people in the world, both men and women. No one can live contentedly without appreciation and special attentions from those they love; and men are known to be even fonder of such little attentions than women.

Having now guarded against the accusation of intolerance, we may be permitted to say a few words regarding flirtation, pure and simple, as a practice, especially in the female sex. It is unworthy in its aims, always unsatisfying, and often disastrous in its results. It has degraded women in the eyes of all worthy men, making them regard almost all girls from the age of sixteen as men-seekers or husband-hunters, or at best as vain, frivolous, and empty-headed. Such women—as George Eliot makes one of her characters say—‘hinder men’s lives from having any nobleness in them.’ Can we think of Beatrice, Laura, Heloise, any of the women of fable or history, who have inspired the grandest passions in the breasts of the noblest men—as flirts? Or even the types of womanly excellence held up to our admiration in the pages of the best novels—Romola, Dinah, Dorothea, Emma, Fanny Price, Charles Kingsley’s Grace, and various others whose names will occur to all fiction-readers. Dare any author—even a third-rate sensation novelist—submit to our approbation as an ideal heroine, or even as an imperfect though worthy female character—a flirt? Yet such has come to be almost regarded as the normal type of young women in real life, all of whose errors are to be condoned, or at least palliated, as natural and excusable. If such women were merely to consider the matter of policy, they would acknowledge that the indiscriminate flirt enjoys but little of the real pride of conquest, as it is called; she never gains the deference, the almost worship awarded by men to the higher type of woman. The flirt often fails in her efforts; and where she succeeds, it has been after the expense of such

infinite pains that she can merely feel that she has got what has cost her desperate means to secure.

The flirt is known by unmistakable signs, to any one of the smallest perception. All are familiar with the numerous varieties of the species. We need only mention a few; and very few words will suffice to indicate the peculiarities of each. There is the noisy, boisterous ‘fast girl,’ whose flirting is but one of her characteristics, along with her extravagant dress, slang speeches, and general unconventionality of demeanour and disregard of appearances. There is the common vulgar flirt, who has neither intellect nor education sufficient to qualify her even for the exercise of the very low art which she professes. This style we are chiefly familiar with in the person of the maid-of-all-work in her intercourse with the milkman or the policeman. But girls of a better class often remind us of her, their flirting merely consisting of pert saucy speeches and tosses of the head. Then there is the sly quiet flirt, less objectionable to society in general, though perhaps more dangerous and designing than the open hoyden. Among this class may be found the ‘Becky Sharpes’ and ‘Blanche Amories’ who, since the advent of Thackeray’s novels, have come to be regarded as the types of artful woman-kind. These are fond of nooks and corners; their batteries are little soft flattering speeches, demure glances, and an affectation of infantine simplicity and innocence; and their victims are generally young unwary lads or easily gulled old gentlemen. There is the practical designing flirt, who sets herself deliberately and of *malice prepense* to entrap a husband, or at least an admirer, with the variety—chiefly found, happily, in sensation novels—of the girl who has an additional zest lent to her game if she can interfere with the claims of other women—either wives or sweethearts. Some would perhaps include the *unconscious* flirt, if such a thing can be; that is, the girl who is naturally gay, and has little winning coaxing ways, which if aided by a pretty person, make her specially attractive, if not dangerous.

Having said so much regarding the coquette, it would be unfair to conclude without passing condemnation upon the male flirt or ‘coquet.’ A most objectionable being; but one, to do men justice, seldom met with, at least in its worst form—that is, the lady-killer. We do not at all mean the ‘ladies’ man.’ There are very few girls, even of the sedate type, who do not like a man who tries to make himself agreeable to ladies, even to the extent of soft speeches and harmless gallantries. Indeed a man who is not fond of ladies’ society is generally fond of much worse things. And that which would be flirting in a woman, is not flirting in a man, or even meant for it; for some license must be allowed to the sex which ought to take the ‘initiative.’ But there is a degraded type of man who goes much further, and often has the breaking of hearts to atone for; one who does so with his eyes open, and knowing well the consequences of his procedure. There are men who set themselves to the task of winning hearts for the pleasure of the game, and who will go to great pains and artifices to do so. They generally exercise their art on young unsophisticated girls—where they can find such—as more fresh and interesting, and easier to

deceive than those who are *au fait* in the practices of coquetry themselves. These are the 'handsome men,' who, by means of a flattering tongue, can easily, in a few pointed speeches—just keeping clear of an actual declaration—make a simple girl think herself the chosen and beloved one. If he mean nothing serious, what can be more unmanly, more ungenerous, than such a course of conduct on a man's part? The male *jilt* can be called to account for his actions; but the mere flirt, the 'lady-killer,' plays his heartless game in secret, quite unsuspected—if he be very artful and wary—even by the girl's family; his delinquencies may be known only to the sufferer herself, who, of course, cannot 'make her moan,' even if she would do so, as he has given her no hold over him. He has had his little amusement, and when he tires, he leaves his victim to seek another.

It may be said 'a woman should not give her heart till very sure of what she is getting in exchange;' but women cannot always be on their guard if a man seems very devoted. The practised male flirt is perilously like the real lover, even to the more wary of the opposite sex; and the heart is sometimes gone irretrievably before the deceived girl knows that she has given everything and got nothing. Happily, the men we have portrayed are rare, and as they often come across girls who can hold their own, or perhaps turn the tables on them, they are not able to do so much mischief as they might otherwise do. Flirts of both sexes have much to answer for. Perhaps they too may have their own troubles, in disappointed hopes and frustrated endeavours. They may sometimes, perhaps, feel the sting of remorse after an especially bad case, in which a lifelong sorrow to another has been the consequence of what was to them merely the pastime of a few weeks or months.

STORY OF A PET MONKEY.

A REMARKABLE instance of intelligence and attachment in a pet monkey, may interest lovers of 'our poor relations' and of animals in general. My hero, a very large and extremely powerful specimen of his class, belonged to a late officer in the British army; and he, having been a member of my own immediate family, the veracity of the following anecdote can be vouched for. Peter was a universal favourite with—one individual only excepted—all the inmates and frequenters of the barracks, where his unusual sagacity and many varied accomplishments were a source of endless amusement; although it must be confessed that some of his tricks had a rather mischievous tendency. His gentleness of disposition and genuine love of fun, nevertheless, procured ready forgiveness.

Peter unfortunately possessed an enemy in the person of a diminutive and generally unpopular subaltern, to whom he appears in some mysterious way to have rendered himself particularly obnoxious. Or perhaps this regrettable state of affairs may have arisen from one of those curious cases of instinctive and mutual aversion at first-sight which, like other and more agreeable impressions of a totally opposite character, are difficult to account for, in man as well as in the lower animals.

During a temporary absence of his master on leave, Peter was intrusted to the care of a brother-officer and most intimate friend, who, on undertaking the responsibility, conscientiously kept him chained to a chest of drawers in his own barrack-room, being anxious that no harm should happen to the monkey while under his charge. This kindly and well-meant arrangement did not, however, at all coincide with Peter's elastic views on the subject. The loss of general society, and hitherto undisturbed liberty of action, the unwonted confinement and restriction, appear to have greatly depressed him. Thus left in a great measure to his own narrow resources, the interesting captive still rose equal to the occasion, though his field of action was certainly limited. To while the tedious hours away, upon a certain day during which he was left alone longer than usual—there being an inspection by the general commanding the district—he seems, in despair, to have hit upon the following occupation. Having, with an amount of patience and perseverance worthy of a better cause, forced open the locks of all the drawers—a feat requiring a very considerable degree of strength—he strewed the miscellaneous contents upon the floor, and seated himself in the centre, monarch of all he surveyed; and doubtless contemplated with tranquil satisfaction the chaos he had produced. Having presumably tired of this, comparatively speaking, harmless recreation, he had evidently begun to look about for further relaxation of mind, combined with healthful exercise of body. Unfortunately, he soon espied a very large inkstand, placed, it must be allowed in extenuation, within easy reach. Immediately availing himself of the contents, and as a little pleasing variety of excitement, he deliberately and with an unsparing hand bedaubed every article of his hospitable entertainer's property with ink. The *tablan vivant* on the entrance of the unsuspecting host may be possibly better imagined than described. Either Peter was a most consummate actor, or else he really honestly considered the effect of his striking performance to be highly artistic and ornamental; for he appeared to be totally unconscious that he had been guilty of the slightest wrong-doing in this somewhat sensational scene. He was mercifully spared from punishment, but summarily dismissed from his comfortable quarters, and left to wander about the barracks 'in monkey meditation, fancy free.'

Delighted to regain his liberty on any terms, all for a time went well. During his rambles, like Richard III. encountering Richmond on Bosworth Field, Peter unluckily met, not the object of his affections, but of his intense dislike; and springing on to the shoulders of the irate and alarmed subaltern, in the presence of a large number of officers and men—whose sympathies were of course all with Peter—he very nearly succeeded, to the great amusement of the audience, in drawing the sword of his enraged victim, who, if report did not cruelly belie him, was not at all likely to draw it readily himself! The ludicrous position in which the latter was thus placed, and the loud laughter of those assembled, of course vastly increased the subaltern's former hatred of the popular and now victorious monkey. They parted with ominous signs, at anyrate on one side, of anticipated

revenge, to be carried out sooner or later to the bitter end.

Shortly after this assault-at-arms, poor Peter was found in a woful condition; it being discovered, amidst general indignation, that he had been fired at, and seriously injured by gun-shot wounds. Notwithstanding the impossibility of proving who was guilty of this unmanly and cowardly action, it was openly attributed to the only person who was capable of committing it—the now most cordially detested subaltern, who had, it was well known, never forgiven the indignity publicly inflicted on him; the annoyance of which was immensely aggravated by the story having become the standing joke of the entire garrison. Peter's numerous sympathising friends did their utmost to save his life, which was in imminent danger. He had the best medical advice; the slugs were all extracted; and with surgical skill and affectionate care, he was happily soon restored to health. His master returned at the time of Peter's convalescence, and the rapturous joy of the poor monkey at seeing him once more will never be forgotten by those who witnessed it. He clung to him, and fondly embraced him over and over again; repeatedly kissing, or rather licking his face and hands, with every possible demonstration of the most devoted attachment.

When the first paroxysm of delight had subsided, Peter, sitting on the table, the better to gaze upon his newly recovered friend and able champion, looked earnestly at him, and clasping his arm, to bespeak special attention, pointed with his own forefinger to each of the wounds whence the slugs had been taken; trying at the same time, in the nearest approach to speech that he could accomplish, to tell the piteous story of his narrow escape from a violent death, at the hands of his ruthless assailant—who never, by the way, had the courage to further molest the subject of this brief memoir. It is questionable if the most intellectual of human beings, not gifted with the power of speech, could have acted more pathetically, or indicated more vividly what had occurred to them during the absence of their natural protector and dearest friend.

FRAUDULENT HAWKERS.

ONE day, in January last, a decently dressed person visited my house and inquired for me by name; afterwards introducing himself as the agent of a firm who were commissioned to sell at a tremendous sacrifice a vast quantity of unclaimed luggage which had been left at the depôts of the various railway Companies. Having heretofore always been under the impression that such luggage was disposed of by the Companies themselves at public auction, I was curious to know something of the firm which had engaged in the speculation of buying up these goods; but the agent shirked my questions, and produced samples of calicoes, flannels, muslins, and other draperies, which he offered to sell to me at prices so ridiculously low, that I was induced to give him a rather large order. Promising that the goods should be delivered in the course of a week or so, he booked the order, being very exact about

the name and address; and then begged leave to call up his assistant with some samples of wonderfully cheap cloth which they had to dispose of.

Leave being readily granted, he called up his assistant, who appeared bearing a very weighty bundle, which on being opened, turned out, not to contain samples but pieces of cloth, each of sufficient size to make a suit of clothes. These he began to exhibit and praise after the manner of people who have goods to sell, assuring me that they were all of the very best quality and make, and not to be purchased in any shop in the kingdom for double the price he was willing to take—namely thirty shillings the piece—choose where I would. The goods were dressed and faced to appear like sound woollen cloths and tweeds, being sufficiently well got up to deceive most ordinary people, especially as each piece was printed with the words 'Royal Patent' in gilt letters at one end; and the 'agent' did not scruple to guarantee them as 'all wool.' As it happened, however, I knew sufficient about woollen manufactures to enable me to detect that the goods were neither 'all wool' nor yet cloth properly so called, but unmistakable shoddy, and shoddy of a very inferior quality to boot; so declined taking advantage of the 'bargain' he offered me. Finding that I was proof against both cajolery and flattery, he bundled up his coloured goods, leaving out one piece which I had chanced to examine somewhat narrowly, flinging it over the back of a chair with apparent carelessness, but really in a manner which exhibited it at its best, and proceeded to open a smaller parcel from which he took a piece of glossy black material, with the remark: 'There sir! there's an article I'll defy you to match in all England, either at the price I'm going to ask you, or at any other! The fact is sir, we have such a demand for this very article, that we have orders not to sell more than one piece to any person; otherwise clergymen and other professional men would soon clear out all our stock and leave none for general customers.'

Shoddy again, artfully got up to imitate West of England broadcloth, but still shoddy.

'Now sir,' he continued, 'when I tell you that five-and-thirty shillings is all we ask for a piece of cloth like that, you have too much discernment to let such an opportunity of making a bargain slip. You'll never have such another chance, as our firm has but very little of it left.'

I, however, obstinately declined to avail myself of the great opportunity which was never to occur again; and my would-be benefactor slowly gathered his goods together, trying me once more, however, with the piece of stuff he had thrown over the chair, offering it, as a last resource, at what he termed the giving-away price of five-and-twenty shillings.

After what had transpired, I very much doubted whether my order for draperies would ever be complied with. So it turned out. I have not since then seen or heard anything about either the man or his goods, nor have I been able to discover a firm in Liverpool bearing the name under which he travelled. Therefore I have come to the conclusion that the cheap draperies

had no existence in fact, but were only assumed as an introduction to the really worthless cloth. That the cloth was worthless, a friend of mine discovered to his chagrin; for having been persuaded to purchase a piece of the so-called tweed, he had it made up; but it so rapidly became 'baggy' at the knees and elbows, as to be quite unserviceable.

On another occasion I was interviewed by a person who had some pictures to dispose of. Not being inclined to purchase, I at first refused to inspect the man's goods; but he pleaded so persistently to be permitted to exhibit them, that eventually I allowed him to do so—first warning him that I should not purchase any. They proved to be rather indifferent oleographs, mounted in showy German frames, but got up to imitate oil-paintings, being furnished with canvas backs, and having a name printed or painted in one corner. Though in speaking of them the man did not actually state that they *were* oil-paintings, he spoke of them in such ambiguous terms, that inexperienced persons would have inferred that they were. He was not so reticent about the frames. Those he declared were double-gilt, and of the very best quality and make, being well worth the money which he demanded for picture and frame together—namely five-and-twenty shillings each, payable either in one sum, or by weekly instalments of not less than half-a-crown for each picture. The offer was tempting enough doubtless; but I could not appreciate the advantage of paying twenty-five shillings, by instalments even, for an article which any respectable picture-dealer would gladly supply me with for half a guinea cash; and positively declined his offer.

Finding that I was firm in my refusal, he packed up his pictures as if to leave me, and had got to the door, when he turned round and begged as a favour, he being a stranger in the town, that I would permit him to leave his pictures until the morning. This favour I readily granted, on the verbal understanding that I would not be responsible for any damage done to them whilst in my care.

Neither the next day nor for several days did any one call for the pictures, which had meanwhile been relegated to the attic. About a fortnight afterwards however, an individual came and presented me with a lithographed form, by which it appeared that I had become the purchaser of four pictures, value five pounds, payable by weekly instalments of ten shillings. This first instalment he politely requested me to pay, and was apparently much astonished when I declined, and denied any intention of even contemplating the purchase of the said pictures. At first he refused to receive back the pictures, arguing that I had had them in my possession more than a fortnight, and that therefore I was bound to keep them. It was not until I had the pictures placed outside the door, and had ordered him to follow them, that I could get rid of him; but eventually he left me, threatening me with an action in the county court; which, however, he never entered.

Of course the whole affair was a scheme to force the pictures upon me whether I would or not. I afterwards discovered that several persons in the neighbourhood had been victimised by these gentry; having been trapped into signing an agreement and paying an instalment, they found that

they had no remedy but to pay the full amount demanded.

Although there are doubtless many honest travelling agents, for my part, after the above two experiences, I have determined in future to have no dealings whatever with predatory merchants of any sort, unless I know that they are really the agents of respectable firms.

'G O D K N O W S.'

[SOME years ago a child's body was found on the South Coast, having been thrown there by the waves. The parish clerk on being asked what should be put on its grave, answered in perplexity: 'God knows.' This proved a fitting epitaph.]

Where the tear-fed violet blooms;
Where the shade the sunbeam chases;
Where in mossy marble tombs
Sleep the dead beneath the daisies;
Where the mourner slowly wanders
When the bird hath sought its nest,
And amid the gloaming ponders
Over those who tranquil rest;

Clouds across the crimsoned sky,
Homeward gaily were careering;
But in that lone churchyard, I
Heeded not that night was nearing.
Discords in my bosom swelling,
Broke the music of life's song,
For my soul was weary dwelling
Mid the ever-earthly throng.

Far within the stilly shade
Of a quiet sequestered corner,
Where the wild-flowers bloom and fade,
Gently nurtured by no mourner,
Was a grave, an infant's only.
No one knew the name she bore.
Ask the waves which, dark and lonely,
Cast her lifeless on the shore!

O'er this grave a humble stone
Reared its lichened head so lowly,
Like a sentinel alone,
Watching 'mid the silence holy.
Hither came the croaking raven;
From this stone its weird notes rose;
On its surface rudely graven
Were the simple words, 'God knows.'

As a moonbeam on the sea
Charms the sad winds' shriek to sipping,
So those tender words to me
Tuned my song, sweet solace bringing.
Though my thorn-strewn way was dreary,
Though my feet found no repose,
Yet my soul, life-worn and weary,
Rested in the thought, 'God knows.'

A TOUR IN MOROCCO.

THE foreign policy of England is always in extremes. Sometimes the rage is all for acquisition of new countries; sometimes for giving up distant possessions in a gust of generosity. A few years ago, Corfu was made a present of to Greece, after costing a good deal of money and being in various ways rectified. This was not the first time that a possession in the Mediterranean was gifted away on no rational grounds. The Portuguese ceded Tangier to the English, and after being kept for a length of time, it was given up to the Moors. The result, of course, was that it lapsed into barbarism, and became a head-centre of piracy and slavery. Situated on the coast of the Mediterranean opposite Gibraltar, Tangier might at this day have been a valuable foreign possession; while its occupation by the British would undoubtedly have been beneficial to the wretchedly misgoverned inhabitants.

The Moors while in Spain were far advanced in civilisation. In many things they were certainly in advance of the Spaniards. It is therefore pitiable to know that in their own region, Morocco, they have returned to a state of barbaric stagnation. As not much is known regarding the interior of the country, the appearance, though delayed, of a *Journal of a Tour in Morocco and the Great Atlas*, by Sir J. D. Hooker and his companion Mr John Ball (London: Macmillan and Co., 1879), is as acceptable as the *Journal* itself is interesting.

These gentlemen travelled in Morocco in 1871, their special object being to visit the Great Atlas, a mountain range of which little is known. Obligated to wait some few days at Tangier for the autograph letter from the Sultan, without which it would have been dangerous as well as impolitic to attempt to travel beyond the limits assigned to consular protection, the travellers spent the time not unprofitably in obtaining from Sir John Drummond Hay that information about the country which from his long residence he is so well qualified to give, and in making botanising

excursions to Cape Spartel, Tetuan, Beni Hosmar, and Ceuta; and on the 20th of April, having obtained the important document, were able to take their departure by French steamer for Mogador, touching at one or two small ports on their way thither.

Although there is much to interest the reader in Mr Ball's preliminary pages, we need not linger over them, since the real excitement of the journey may be said to commence from the moment when El Hadj Hamara, the governor of Mogador, reverently applies to his forehead and then breaks the seal of his master's letter, and learns that he is to forward the English *hakim* and his companions to the care of 'the slave' El Graoui, to whom orders have been sent as to what he is to do; and proceeds to carry out these very curtly conveyed instructions, which, however were still further enforced by the arrival of a courier from the Sultan's eldest son, the viceroy of the southern provinces, with orders to take every care for the safety and comfort of the travellers during their journey to the capital. It may be as well to mention that 'the slave' El Graoui was no less a person than the governor of that portion of the Great Atlas subject to the Sultan's authority; a stout man of completely black complexion, whose broad countenance gave the impression of considerable energy, with an habitual expression of good-humoured ferocity—a person upon whose assistance must depend entirely the failure or success of the expedition. By cleverly taking advantage of the rivalry which subsisted between him and the governor of Morocco, Sir J. D. Hooker effectually managed to secure his friendly intervention so long as it was needed; and he gives us many amusing instances of the form in which official protection displays itself in this country. For instance, a representation having been made by Mr Carstensen, the British vice-consul at Mogador, to the effect that horses and mules for riding, together with numerous baggage animals, would be required, an order had gone forth a week before the arrival of the party that no horses or mules should be sold or hired until

such as were needed had been selected; and a complaint having been made that some brass-work ordered from a certain skilful craftsman had not been executed within the time specified, the artisan was at once thrown into prison, and a soldier placed over him to see that he did no other work than that promised to the English strangers.

Wherever the travellers turned, not only were houses placed at their disposition, but a considerable *mona* or food-offering was literally laid at their feet at each resting-place. This *mona* indeed must have been, owing to the shameful rapacity of the native escort, a terrible burden upon the people, especially the poor mountaineers, consisting as it did of large numbers of sheep and fowls, with bread, tea, loaves of sugar, French candles, eggs, butter, honey, corn for the horses and mules, and dishes of barley-porridge and *ke^h loussou*. But the order having gone forth from the Sultan that the travellers were to be put to no expense whatever, they were powerless to prevent the exaction, and could only recognise the justice of the request that they should not make a long stay in the higher valleys, where the population was not rich enough to be able to support them for any length of time, although the reputation of Hooker as a distinguished and successful *hakim* caused him to be everywhere received with favour, and followed by crowds of suffering people.

A curious difficulty presented itself at the outset, namely how to assign for the expedition an object which should be in any way intelligible to the Moorish mind. 'We were well aware,' says Mr Ball, 'that anything so simple as the statement that the object was to gratify our curiosity as to the vegetation of the Great Atlas, would at once be set aside as a false pretext, intended to cover some sinister design. That one man should be crazy enough to make a long journey for such a purpose might have been thought within the range of possibility; but to suppose that three should all at once be smitten with such a form of insanity, was plainly too ridiculous. To endeavour to explain that Hooker, as Director of a great national establishment, such as Kew Gardens, should be anxious to enrich it by the introduction of new, rare, or useful plants, was not likely to be more successful;' so they hit upon the idea of stating that the Sultana of England had wonderful gardens, in which were plants from all countries of the world excepting the Great Atlas, and that she had sent Hooker and his assistants to collect and send home whatever they could find there. But this suggestion was entirely objected to on the ground that a powerful sovereign must not occupy herself with anything so frivolous as a garden; her thoughts must be with her government and with her fleets and armies!

It was, however, conceded that the acquisition of medical plants might be a worthy object of desire; and Hooker having accordingly stated that his mission had especial reference to these, the received version of the affair came to be that the Sultana of England had heard that there was somewhere in Morocco a plant that would make her live for ever, and had sent her

own *hakim* to find it for her; so that when the botanists were observed to undergo rather hard labour, the commentary always was: 'The Sultana of England is a severe woman, and she has threatened to give them stick (*bastinado*) if they do not find the herb she wants.'

After much consideration as to the direction their journey was to take, which, owing to the difficulty of obtaining reliable information about the country, was by no means an easy matter to decide, it was resolved to push forward into the interior, and try to reach the head of the valley of the Tessout—the main western branch of the Oum-cr-bia—lying probably about one hundred and twenty miles due east of the town of Morocco, as by this means it was thought that the easiest approach to the higher portion of the Great Atlas would most probably be found. Accordingly, having obtained from El Graoui letters to all the Kaid of the valleys extending from Tassereimout to the borders of Haha, as well as to the governor of Demeinet, and taking with them three small tents, a considerable amount of baggage, and several attendants, besides an escort of nine privates and two officers, the party—now forming a procession of thirty-seven men and thirty-three horses and mules—slowly defiled through the filthy lanes of Morocco, and left the city by the south-east gate, on what must have indeed been an expedition of most exceptional and quite absorbing interest.

Looking at Mr Ball's new map of Southern Morocco—upon which, by the way, it is a pity that the travellers' route is not indicated with more distinctness—we see a grand chain of mountains, rising it is said to a mean height of twelve thousand two hundred feet for a distance of eighty miles, thus surpassing any other of equal length in Europe or in the countries bordering on the Mediterranean. Of this chain the travellers first gained the summit ridge—much to the disgust of their guides, who did all they could to hinder them from making the ascent—in the midst of a snow-storm of such violence that it was almost impossible to face it, and were of course unable on that occasion to do anything but return as quickly as possible to a less inclement region. The appearance of the party was, says the writer, most singular; faces of a livid purple were inclosed by masses of hair thickly matted with ice; and the beards, frozen in the direction of the wind, projected on one side, giving a strangely distorted expression to each countenance.

On another occasion, when they ascended the Djebel Tezeli mountain, they were fortunate in a cloudless sky, and the white mantle of snow had also almost entirely disappeared. This time they were able to study the grand panorama, and to take careful note of every object presented to their view. Looking towards the south, at a distance of fifty or sixty miles rose the range of the Anti-Atlas, shewing a wavy outline with rounded summits, the highest portion being a few degrees west of south; and between these and the summit where they were, lay the Valley of Sous, represented as 'the proper home of everything strange and marvellous in the empire;' a region, however, which religious fanaticism now guards with especial rigour. In the sixteenth century, Tarudant, its capital, was a large and flourishing city, resorted to by English and French merchants; while in the

present day the single English traveller Mr Jordan, who has succeeded in reaching it, was only saved from death by being immediately sent away by the governor, and ordered to put as wide a space as possible without loss of time between himself and the fanatical city.

To return to the summit of Djebel Tezah. Looking to the east-north-east and east-south-east, massive buttresses stretch away from the main chain of the Atlas, some probably surpassing the height of thirteen thousand feet above the sea-level; while more to the north was beheld a remarkable isolated mass, forming a bold promontory. On a platform of level ground a few feet below the summit were about a dozen rude stone buildings, probably intended as shelter for herdsmen who in summer drive their flocks to this lofty region. On some of the lower parts of the mountain, trees of the belloc oak (*Quercus ballota* of Desfontaines), of great age, and having thick trunks, are still to be found, the remains probably of forests which once clothed its flanks.

The impressions which the travellers derived of the outer region of the Great Atlas were very agreeable. They found the country populous and fertile; and though but little space existed for tillage, olives, walnuts, and the Indian fig grow luxuriantly, and afford a considerable amount of sustenance; while the destructive practice of setting fire to the brushwood in order to obtain scanty pasturage for sheep and goats, is the only cause which prevents the northern slopes from being clothed with valuable timber. The *Callitris*, which under the name of citrus-wood obtained such an extravagant price in the days of imperial Rome, might easily become a source of wealth, for the beauty of the wood would secure a ready market, were the trees, of which small specimens are abundant, allowed to attain a sufficient size. At present, the only use made of them is the production of gum-sandarac, a small quantity of which is exported to Europe. The *Juniperus Phœnicea* appears to possess some medicinal quality, since a kind of tar is made from it, which is found to heal the sores of men and animals. All attempts to discover the Morocco gum-anumoniac plant proved to be fruitless. The Moors called it Kileh, and stated that it is to be found at some distance north of Morocco city. The gum-arabic plant grows principally about Demeuet, and is said to be the *Alk Tlah*, the *Acacia gummifera* of Willdenow; but unfortunately at the time of the expedition neither the flower nor fruit of it was procurable.

Undoubtedly, the most remarkable vegetable production of Morocco is that singular tree *Argania sideroxylon* or Argan, first introduced to us by Leo Africanus, and which is so much valued on account of its oil, as well as for its fine-grained timber of singular hardness; while the husks of the fruit provide such excellent food for camels, goats, sheep, and cows, that the countryman going into the woods to collect Argan nuts invariably takes his herd with him, that they may feed upon it while he is separating the nuts from their green envelope. To extract the oil, the shell is first broken and the nut afterwards roasted like coffee, ground in a hand-mill, and kneaded with a small quantity of hot water. The Argan tree, which in growth has a resemblance to the olive, is confined to a very circumscribed area of

Morocco. It presents at times a most curious appearance, as goats are so fond of the nuts that they will climb in search of them almost to its topmost branches. And Mr Ball gives us a sketch of one or two venerable specimens, loaded with these scansorial quadrupeds, who seem to be enjoying themselves to their hearts' content.

In his chapter on the resources of the empire, the writer says that it is difficult on this subject to say too much. With an almost unequalled climate there is scarcely any one of the productions of the warmer temperate and subtropical zones that may not here be obtained. Already the country supplies large quantities of olive-oil, dates, oranges, and almonds, with a little cotton; and the esparto grass now so largely consumed by paper-makers is exported from the province of Haha. The supply of cotton of course might be largely increased; and there seems to be no reason why coffee, tea, sugar, indigo, and other valuable exotic produce should not be raised, if the deficient rainfall were supplemented by increased irrigation. There is, however, one difficulty less easy to surmount—namely the frequent inroads of the destroying locust, against which, up to the present time, no effectual means of defence has been discovered.

Necessarily in many respects superficial, from the very limited time the exploration lasted, the work yet throws considerable light on the condition of the country, shewing not merely its misgovernment, but the absolute stagnation of everything, even where, as in many cases, actual deterioration is not self-evident; and one cannot help agreeing with Mr Ball when he says that with an effete race, corrupted by luxury, who have lost the spirit, but preserved many of the traditions of a decayed civilisation, no improvement can be expected; and that the best chance for Morocco would be that it should pass under the control of a civilised state, strong enough to overcome speedily the inevitable resistance of the Moorish ruling class, and advanced enough to consult the welfare of the people it undertakes to govern.

THE BRAVE SWISS BOY.

CHAPTER II.—A PERILOUS ADVENTURE.

It was still early in the day when Walter left the cottage a second time. His heart was cheerful, and his movements light and rapid. Instead, however, of taking the road leading to the inn, he struck off in a zigzag path through the valley towards the Engelhorn, whose jagged and lofty peaks rose far up into the blue sky. After a short time he reached the large and splendid glacier that lies between the Engelhorn and Wellhorn, cast a hasty glance at the beautiful masses of ice burnished to prismatic brilliancy by the morning sun, and then turned to the left towards a steep and narrow path leading to the summit. As the road grew more difficult at every step, his progress became much slower, and he purposely reserved his strength, knowing well that it would be severely taxed before he gained the object of his journey. After a toilsome ascent of half an hour he reached the lofty crag called by the moun-

taineers the Warder of the glacier, and sat down to recover his breath.

It was very necessary for him to take a little rest; for the way he had come, although long and tiring, was as child's-play compared with the difficulties he had yet to overcome. He had to climb the steep and dizzy heights that towered above his head; and instead of walking along a narrow footpath, he would have to clamber over rocks and loose stones, to pass close to the most dreadful precipices, and across foaming mountain-streams, till he reached the height at which the refreshing green disappeared, with nothing visible but huge masses of brown and gray rock; where no other sight met the eye but that of mountain tops covered with perpetual snow and ice—a world dead and deserted, where the familiar voices of nature were almost unknown; where no bird carolled its love-song from the waving branch; where no sound was to be heard save the muttered thunder of the avalanche, the roaring of the cataracts which poured forth from the melting glaciers and made courses for themselves through heaps of rough stones; and now and again the harsh and discordant scream of a solitary vulture that with outspread wings circled slowly aloft, piercing into the valleys with its keen eye in search of prey. Into these wild and lonely regions Walter had to climb in order to reach the lofty crag whereon the vulture—the far-famed Lammmergeier of the Alps—had reared her eyrie.

But these difficulties had little terror for the cool-headed and brave-hearted mountain youth, who had from his earliest days been accustomed to roam on dizzy heights where the slightest false step would have been destruction. He was determined to finish what he had begun; and gratitude to the noble and generous stranger lent new courage to his soul, and strength and endurance to his frame.

After a short rest he jumped up again, and renewed the toilsome ascent, following slowly but steadily the dangerous track that led to the summit of the mountain. His feet often slipped on the bare and polished rock; sometimes he slid ten or twenty paces backwards over loose pebbles, and anon sank knee-deep in the snow which here and there filled the hollows; but nothing daunted him or caused him to waver from his purpose. At last he reached a broad sheet of ice with innumerable crevices and chasms, on the further side of which a narrow ridge like the edge of a knife stretched above a wild and lonely valley, the base of which yawned two or three thousand feet below. At the extreme end of this ridge the nest he was in search of was built on a small point of rock, the sides of which descended precipitously into the depths below.

With his eye fixed on the distant crag, Walter commenced the passage of the ice-field. The utmost caution being necessary at every step, he felt carefully with his long staff to ascertain whether the snow that covered the icy mass was fit to bear his weight, or only formed a treacherous bridge over the numerous ravines which yawned beneath. Bending his way round the large chasms, he leaped easily over the smaller ones with the aid of his staff; and after

avoiding all the more dangerous spots, he succeeded, by caution and presence of mind, in safely reaching the further side of the glacier, where the last but most perilous part of his journey was to begin.

As he stood there leaning on his alpenstock, out of breath with the exertion he had undergone, and surveyed the fearful path which scarcely any human foot had ever dared to tread; as he cast a glance at the dizzy precipices which yawned on each side of the ridge, which was itself in many places scarcely a foot in breadth; as he considered the inevitable destruction that would follow a single false step, he began to feel his courage fail, and lost for a moment the confidence and contempt of danger which had filled his soul an hour or two before, and sustained him during his perilous journey. 'What if I should never return, nor see my father again?' said he to himself, as he drew back from the road which seemed to threaten him with destruction. 'Is it not too great a risk to run?'

But these fears only lasted a few moments. He called to mind the generosity of the stranger, and pictured to himself the delight with which he would receive him if he returned laden with such valuable booty; and his determination was renewed on the spot.

'I should be ashamed ever to look him in the face again,' said he to himself; 'and what would father say if he were to see that I was afraid of climbing a few rocks? No, no! I must and will have the birds; so here goes!'

Laying his alpenstock on the ground, he took off the thick jacket and heavy shoes which would but hinder his progress, and with only his shirt and trousers on, an axe in his belt, and the game-bag hung over his shoulder, he started forwards with all his former courage and energy, to complete the dangerous undertaking.

His progress was not difficult at first. The ridge along which he had to go was broad enough to begin with, although very rough and wild here and there. But after he had gone a little way, it got so narrow that he found it difficult to secure a foothold. At this point the ridge became so attenuated that the youth saw at the first glance that it was impossible to proceed in an upright position; he therefore crept along on all-fours, or sat astride the ridge and urged himself on with his hands and feet.

Thus, with extreme difficulty he pursued his perilous way towards the end of the ridge on which he knew the eyrie was built. But presently he saw the nest and could hear the young birds piping, which gave him new strength and determination. At this juncture a loud scream overhead caused him to look up, and he was alarmed to see the female vulture wheeling round the nest with a young goat in her talons. With this new danger menacing him, the young cragsman lay flat down on the rock, and remained motionless, while he offered up an earnest prayer to heaven that the bird might not discover him. He knew the peril which threatened him, for he had often heard of the fury with which the vulture attacks any one who attempts to rob its nest. He had heard of many cragsmen who had lost their lives in that way, and his own position was by no means the most favourable to defend himself against attack. His short and earnest prayer was not in vain.

The young birds screeched louder and louder as they saw the prey in their mother's talons; and after the vulture had further tempted their appetite by one or two more majestic sweeps, she dropped the dainty morsel into the nest, where it was at once seized. After assisting her young ones to make a good beginning of their meal, the mother bird unfolded her powerful wings, and glided into the valley beneath with the speed of an arrow.

'Heaven be thanked, I am saved!' murmured Walter as he rose from his uncomfortable position and wiped the perspiration from his forehead. 'I must lose no time now, or perhaps one or both the old birds may return.'

He pressed on with redoubled energy till an event occurred, unimportant in itself, but which caused him some uneasiness, and reminded him of the need of caution. The rock in places was fragile and split up by the weather, and with a slight touch of his foot he loosened an immense fragment of stone, which went rolling down the side of the mountain till it reached a projecting ledge hundreds of feet below. A pang of terror shot through the boy's heart, and his face blanched, as he watched the stone thundering over the obstacles in its way until it disappeared in a cloud of dust. It seemed as if the whole mountain trembled beneath him; a mist bleared his eyes; and as the blood rushed to his head, a deadly giddiness threatened to overpower him. He felt an impulse to throw himself over, which he could scarcely resist; and it was only by falling on his face and shutting his eyes, that he recovered his presence of mind. After thus lying for several minutes with beating heart and quaking limbs, until by degrees he became more at ease, he ventured to look around him once more, and fixed his eyes on the nest, which was now only about fifty paces farther on.

After waiting a few minutes longer, to be sure that his courage had returned, he made a fresh start, determining not to allow anything to alarm him again; and soon reached the end of the ridge, and viewed the nest with the young vultures before him. But here still another difficulty presented itself. The rock, which up to this point had been quite level, rose at the extreme end about eight feet above the ridge, and formed a sort of projecting platform, which the parent birds, with their wonderful sagacity, had deemed the most suitable spot on which to take up their abode. As he measured the height with his eye, Walter began to fear that after all he would be obliged to return without accomplishing his object, for the rock was so smooth as scarcely to afford the least hold to either his hands or feet. Fortunately, however, he recollected his little axe, which might do him good service if the stone, as he hoped, proved soft. Raising himself cautiously, he drew the axe from his belt, and while supporting himself with the left hand, dealt the rock several vigorous blows with the right, and to his great delight succeeded in making notches, by which, if he only went carefully to work, he could accomplish his object.

With renewed courage he clambered up the almost perpendicular rock, and his curly hair and sun-burnt face soon appeared above the edge of the nest. The next moment he leaned over, seized the young birds in spite of their angry

cries, transferred them one after the other to his bag, and throwing it across his shoulder began to return on the dangerous road by which he had come. In common, however, with the experience of all who have ascended precipitous heights, he soon found that going down was much more difficult than had been the coming up; but ignoring the fact that he had beneath him a precipice two thousand feet deep, he devoted all his attention to the work immediately before him, and carefully descended the rocky wall step by step, till he reached the level ridge once more. He then turned slowly round, slung his bag in front of him, and leaning back against the wall, surveyed the giddy road which he must traverse to reach the glacier and the steep declivities of the Engelhorn, and thereafter his native valley.

It was a difficult and dangerous road; but the young mountaineer's heart was now full of joy and confidence, for he had surmounted the greatest difficulty, and the prize of his bold and daring venture was in his possession. He uttered an exclamation of triumph; then, thanking God for the help he had received, he implored the Divine protection on his homeward journey. The sharp ridge made it necessary for him, as before, to work his way forward astride on the rock for some time; but he soon got within sight of a part where it would be possible to go on his hands and knees, and was just about to exchange his striding position for the more comfortable one of crawling, when the constant shrieking of the young vultures in his bag was answered by a piercing cry from above, followed the next moment by the loud rushing of powerful wings close to his ear. The boy uttered an exclamation of horror, and clung with all his might to the rock to prevent himself from falling.

In an instant he perceived the fearful danger that threatened him. One, or perhaps both the old birds had been attracted by the cries of the young ones, and were about to avenge themselves on the robber of their nest. Walter guessed that a hard fight would probably take place, and his first impulse was to throw the bag with the young birds into the valley beneath, and then try to make his escape as well as he might. But he soon found that this plan was more readily formed than it could be executed; for before he could make a single movement, he felt the blast of the wings just above his head, while the screaming of the enraged bird so confused his senses, that he had great difficulty to avoid being hurled from his narrow resting-place into the ravine below. This sudden danger, although it alarmed him for the moment, awoke the next moment the courage and determination of the brave-hearted boy. It was a case of life or death, and it was vain to think of retiring from the contest. So, snatching his axe from his belt, he aimed a powerful blow at the old vulture as she swept down upon him for the third time. He succeeded beyond his expectation, for the blow, made almost at random, struck the wing of the bird, which, after vainly attempting to continue the struggle, fell helplessly into the abyss.

Relieved of his antagonist, Walter felt completely exhausted, and was obliged to lie down at full length for several minutes until he regained his breath and self-possession. He then made the best of his way along till he reached the steep

road leading to the glacier, and had got about half-way down, when just in the most dangerous part, he heard the ominous scream again, and saw with a shrinking horror that the male vulture, attracted, like its mate, by the continued cries of the young birds, had discovered him. In a fury of rage the angry bird darted downwards, and sweeping past with outstretched talons, tried to hurl him headlong from the crag.

In this dreadful crisis, Walter pressed as hard as he could against the rocky crag, having but one hand at liberty to defend himself against the furious attack of the bird. It was quite impossible for him to get at his axe; and the force with which he was menaced, caused him nearly to let go his hold. He tried to seize the vulture's throat and strangle it; but the bird was too active, and made all such attempts perfectly useless. He could scarcely hope to continue such a dangerous struggle much longer. He was becoming faint from terror, and his left hand was fast growing benumbed with grasping the rock. He had almost resigned himself to his fate, and expected the next moment to be dashed to pieces on the field of ice beneath. Suddenly, however, he recollected his pocket-knife, and a new ray of hope dawned. Giving up the attempt to clutch at the furious bird, he drew the knife out of his pocket, and opened it with his teeth, and aiming two or three blows at the creature's breast, he found at last that he had been successful in reaching some mortal part. The fluttering of the wings ceased, and the dying bird stained the virgin snow with its blood on the ice-field below. Walter was saved—there was no other enemy now to fear—his life was no longer in danger; but his energies were taxed to the utmost, and it was well for him that the terrible contest had lasted no longer.

Pale, trembling in every limb, and spattered with the vulture's blood as well as that which trickled from the many wounds he had received, the valiant young cragsman sank helplessly to the ground, where he lay for some minutes, stunned with the terrible exertion he had gone through. At length, however, he so far recovered himself as to be able to continue his fatiguing and dangerous journey, and soon succeeded in reaching the spot where he had left his jacket, shoes, and alpenstock. Having gained a place of safety, he poured forth his thanks to God for delivering him from such great danger, and began to bind up his wounds, which for the first time were now painless. When this was accomplished in a rough and ready sort of way, he had a peep at the trophies in his bag, whose capture had been attended with such adventurous danger; and with the aid of his alpenstock succeeded in getting the dead body of the old bird, which he found had been struck right to the heart. But his knife he could not recover, so concluded that he must have dropped it after the deadly encounter.

'That doesn't matter much,' said he to himself, as he looked at the size of the bird. 'It is a good exchange; and if I give the stranger the old bird with the young ones, I daresay he will give me another knife. What a splendid creature! Fully four feet long, and the wings at least three yards across. How father will open his eyes when he sees the dead Lammergeier—and the Scotch gentleman too!'

Tying the legs of the bird together with cord which he had fortunately brought, he slung it across his shoulder, to balance the weight of the bag; and then started on his journey across the glacier, the foot of which he soon reached, and was then within hailing distance of the hotel where the stranger was residing.

It was a good thing that he had not been kept longer away, for the sun was beginning to set by the time he reached the valley, and only the highest peaks were lit up by its departing glory. Tired and hungry, Walter was thankful to find himself once more at the door of the inn, where there was the same crowd of travellers, guides, horses and mules he had seen in the morning. His appearance had attracted general attention as he descended the last hill leading to the hotel.

'Why, I declare it's Watty Hirzel!' exclaimed one of the guides. 'He was here this morning, and I declare he's got a young eagle hanging across his shoulder.'

'Say an old vulture, Mohrle, and you'll be nearer the mark,' replied the lad in a cheerful tone and with sparkling eyes; for he felt so proud of the triumph he had achieved, that all fatigue seemed to be forgotten. 'An old vulture, Mohrle, and a splendid fellow into the bargain! I've got the young ones in my bag here.'

'You're a pretty fellow!' said another guide, with a sneer. 'I suppose you mean to tell us that you've killed the old bird and carried off the young ones?'

'Yes; that is just what I mean to tell you,' replied the boy, smiling, and paying no attention to the sneer of the other. 'I've done it all alone. I took the youngsters out of the nest, and had a regular fight with the old ones afterwards. I brought one of them home; but the other you will find somewhere in the Urbacht Valley, if you like to go and look for it.'

'I think the lad speaks the truth,' said Mohrle, gazing at Walter with astonishment and respect. —'You've had a long journey, my boy, and you're covered with blood. Did the old vulture hurt you?'

'Yes; the brute stuck his claws into me, and if I hadn't had a sharp knife in my pocket, it would have been all over with me. But let me through, for I want to take the young birds up-stairs to a gentleman here.'

Mohrle and the other guides who had surrounded the courageous boy would gladly have detained him longer to hear all the particulars of his daring adventure; but he pressed through the crowd, promising to tell them all about it afterwards, and made his way up to the room occupied by Mr Seymour, who received him with as much astonishment as the guides had done.

'There sir,' exclaimed Walter, as he took the young vultures out of his bag and laid them on the floor—'there are the birds you wanted; and here is one of the old ones which I brought with me from the Engelhorn. But you must let them have something to eat—the live ones, I mean; for they've had nothing for nearly a whole day, and are squealing for hunger.'

Mr Seymour stood for a moment speechless. He was filled with delight at the sight of the young birds he had so long wished for, but was at the same time dumfounded at the courage and honour of the young mountaineer.

'Is it possible?' he exclaimed at last. 'Have you really ventured to risk your life, although I told you that I didn't want the birds?'

'Well sir, I know you said so; but I saw by your face that you would like to have them all the same; and so, as you had been so kind to me, I didn't mind running a little risk to please you, although it was hard work. So there they are; but you mustn't forget to feed them, or they will be starved to death before the morning.'

'Oh, we will take good care that they don't die of hunger,' replied Mr Seymour, ringing the bell. 'I think, as you take such a warm interest in the welfare of the birds, you must feel rather hungry yourself. So sit down and have something to eat, and then you can tell me all about your adventure.'

When the waiter came, some raw meat was ordered for the fledglings—which were presently safely housed in the stable-yard—and a good dinner for Walter, who, aided by Mr Seymour's encouraging remarks, did justice to a meal the like of which he had never before seen—a finale which was to him by far the most agreeable part of his day's work. Then the lad commenced, in simple language, to describe all that he had gone through, which, while it pleased his host thoroughly, caused him to feel still greater surprise and admiration at his young friend's unaffected bravery and presence of mind.

'You have performed a brave and daring action,' said he, when Walter had finished his story. 'I should call it a rash and fool-hardy adventure, had you not been actuated by a noble motive in carrying it out. A feeling of gratitude inspired you, and therefore God was with you, and preserved you. But tell me, boy, how is it that you had courage and resolution enough to expose yourself to such a frightful risk?'

'Well sir, I can't say,' replied Walter thoughtfully. 'All I know is that I was determined to do it, and that is enough to help one over a great many hard things. At the very last, when I was attacked by the second vulture, and might have been easily thrown down the rocks, the thought came into my mind that you must and ought to have the birds; and then I recollected the knife in my pocket, which settled the business. Yes; that was it sir. You had been so generous to me, that I made up my mind to fight it out; and there's the end of it. I couldn't think of being ungrateful after so much kindness.'

'Well, my lad, you have proved most clearly that you have a thankful heart and a cool and determined head,' said Mr Seymour, not without emotion. 'Maintain these characteristics, and use them always for good and noble purposes, and I am sure you will find the end of every adventure as satisfactory as this has been to-day. I owe you a new knife and a suit of clothes; for the old vulture that has used you so badly was not in our bargain this morning. But we will talk about that another time. You had better go home now; for I think your father will begin to feel anxious about you, as it is getting late. I will come and see you in the morning.'

Walter left the room in great glee. He stopped a few minutes in the court-yard to tell the impatient guides what he had gone through, and then hurried home as fast as he could, where he found his father waiting for him with some impatience.

'Everything is settled, father!' he exclaimed, as he clasped him round the neck. 'We shall get our cow back again now; for I've got the money, and neighbour Frieshardt can't keep her any longer. I've brought it with me from the Engelhorn!'

The peasant could scarce believe the hurried words of the excited boy, and was afraid his head was turned, until Walter opened the little cupboard where he had put the money, and laid the two bright gold pieces on the table. There was no longer any room for doubt; and the poor man's eyes sparkled with delight as he looked at the sum which was just sufficient to pay his debt and rescue the cow from the hands of his neighbour. 'But how did you come by all this money, Watty?' he inquired. 'I hope you have got it fairly and honestly?'

'Yes; quite honestly, father,' replied the boy with an open and exultant smile.

'Well, tell me—— But no; I must go and get Liesli out of prison without a moment's delay. Come along with me to neighbour Frieshardt's, Watty.'

Away went the happy pair to the neighbouring farm-house; and although Frieshardt looked sullen and displeased when Toni Hirzel laid the gold pieces on the table, it was no use for him to offer any resistance; so he went rather sulkily to the cow-house, and let out the captive animal, which was followed home by the peasant and his proud son, and got a capital supper in her old quarters. When this important business was accomplished, Walter repaired with his father to the little cottage again, and for the third and last time that day related all the adventures he had gone through.

'Thanks be to God that He has watched over you, and brought you safely home again!' exclaimed the father, who had listened with a beating heart to his son's story. 'It is a great blessing that we have got the money, for my cousin couldn't lend me any. But now promise me faithfully, youngster, that you will never go on such a dangerous errand again without speaking to me about it. It is a perfect miracle that you have come back alive! We have good reason to be thankful as long as we live that you didn't miss your footing or get killed by that savage vulture. But what I wonder most at is that you could muster up the pluck for such a risky business.'

'Well, father, I did it for you, and so that we could get poor Liesli back again,' replied the boy. 'We could never have got on without the cow; and as the Scotch gentleman had been so kind to me, I made up my mind to get the young birds for him, and thought nothing about the danger.'

'I am very glad you have been so successful,' said his father; 'but never forget that your success is owing altogether to God's help, and don't forget to thank Him with all your heart for His watchful care.'

'I'll be sure not to forget that, father,' was the boy's reply. 'I know that the greatest courage is of no use without God's blessing; and I prayed for help before I set out, and several times afterwards.'

'That was right, Watty. Never forget God, and He will always be with you, and protect

you all your life long. And now, good-night, dear boy.'

'Good-night, father,' replied Walter heartily; and both retired to their humble beds, and were soon wrapped in deep and healthful slumber.

A CORNISH CAIRN.

IN various parts of Great Britain, but more especially in the south-western counties of England, are scattered certain mounds of varying size, which, to many will seem to be natural eminences. On investigation, however, these are found to be what are termed sepulchral mounds, or in other words, the burying-places of human beings who died ages ago. Up to comparatively recent times, little was known respecting these mounds or barrows, which, with superstitious veneration, were allowed to remain untouched by the spade or plough. Modern science, however, combined perhaps with a certain curiosity, has set people to work to ascertain the contents of these curious structures, resulting in 'finds,' which from their nature, are looked upon with the greatest interest both by antiquaries and the general public.

The articles found in these sepulchral mounds are for the most part stone coffins, or cists as they are termed, inside which are frequently deposited earthenware urns, containing the burned ashes of the dead. Beside these remnants of mortality are sometimes scattered beads, axe-heads (celts), bronze implements, and articles for adorning the person, collections of which are to be found in our museums. The opening of a barrow, it will thus be gathered, is looked upon by those more immediately interested as an operation not only curious in itself, but likely to be followed by the discovery of articles of pre-historic value. With this introduction we will proceed to say a few words concerning the opening of what our contributor terms a Cornish Cairn.

The pre-historic folks who built the recently opened cairn on Bollowall Cliff, St Just in Penwith, certainly had an eye to a grand prospect, for it would be hard to find a grander along the whole Cornish coast. Cape Cornwall and Cairn Gluze (the gray rock) to right and left; and southward, cape after cape, and then the long sweep of Whitsand Bay, flanked by Pen-maen-dhu (black stone head), beyond which projects the Land's End.

The cairn of which we speak is seventy feet across the outer, and more than thirty across the inner diameter. It must have resembled two huge domed or 'beehive' huts, one inside the other; both the outer and inner walls presenting a well-finished regular facing, and the space between the two being filled in with earth and rough surface stones. It was the abundance of these surface stones, so unlike the angular *débris* of mine-workings, which led an experienced miner to suspect there was something worth exploring in this heap, which struck him as distinct from the mine-rubbish with which the greater part of the cliff is covered. Fortunately, a namesake and descendant of the famous Cornish antiquary Dr Borlase looks on all local archæological work as his by inheritance. He has had the barrow carefully and thoroughly opened; and moreover, has taken care that portions of the inner and outer walls, and

two at least of the cists, shall be preserved in the state in which they were found.

When this interesting barrow or cairn was opened, the inner space was found to contain several cists, in all of which were urns, or fragments of urns, of very rude badly baked pottery. These were full of ashes and bits of charred wood. Not a trace of metal was found, nor in fact anything except a few round stones, one large stone bead, and seven very curious glass beads. Besides the cists, there was a central burning-place covered with a layer of ashes. The space between the inner and outer walls contained a number of cists with urns just like those found in the inner ring. The place was apparently used for the successive interments of a tribe—possibly that tribe whose pah or fortified village was the neighbouring cliff-castle of Kenidzack. The entrance to the central burning-place may have been kept open till the whole available space was filled with cists; it was then, we may suppose, walled up, and the outer wall gradually raised as the inter-space also got filled with cists.

Despite the poverty of the 'finds,' the barrow is, from its size and mode of construction, one of the most remarkable ever opened in West Cornwall. The face of the outer and inner walls strongly resembles the very peculiar work seen in the fogos or underground chambers, of which there are several in the neighbourhood; in both, the corners are rounded off, and the dome-shape preserved in precisely the same manner. Its age is of course uncertain, for no one knows how late archaic customs may have lingered on in this corner of the land. Bronze was very rare in West Cornwall in the days when men burned their dead and placed the urns in cists covered with huge barrows or cairns. Moreover, Canon Greenwell, in his interesting book on British Barrows, shews it to have been as rare among the early dwellers on the Yorkshire wolds. Only here and there in England is much metallic wealth found in primeval burying-places.

It does not, however, need the excitement of rich 'finds' to interest most people in opening a barrow. Every chip of flint, every rolled pebble, sets workers and onlookers on the *qui vive*. Every half-inch of charcoal seems to tell its share of the story. And when, after heaps of rubble have been thrown out, a small flat stone is laid bare, and then another joining it, the two forming the broken capstone of a stone coffin, the excitement is intense. The handling of an unglazed half-baked urn is a delicate operation, for it sometimes happens that when it is all but disengaged from the earth around, the frail vessel falls to pieces at a touch. One very large urn now in the Penzance Museum, was successfully put together after being shattered into small bits, because its discoverer, fearing a catastrophe, chalked zigzag marks all over its surface before he allowed the workmen to lift it up; the marks served as guides to himself and his wife in the work—a labour of love, but a great labour nevertheless—of piecing it together again.

The glass beads of course have given rise to much discussion. Everybody in West Cornwall believes in the close alliance which in former times existed between the Cornishmen and the Phœnicians. The latest historian of Penzance tells us that their sailors used to wear 'the

flowing garments of the East.' You encounter the Phœnicians while sharing Cornish hospitality; praise the Devonshire cream, and you will at once be stopped by the gentle but firm assertion that it is not Devonshire, but Phœnician. And though sceptics may sneer, the West Cornishman will still believe in his Phœnicians. Be that as it may, the intelligent tourist will do well not to leave the neighbourhood without seeing Bollowall barrow.

[Since this was written, the excavation has been completed. Many more cists have been found, containing more than a hundredweight of broken pottery. A gallery, roofed with huge slabs, has been opened on the south side of the outer circle. Such a gallery exists at the Burgh of Æugus at Newtown on the Boyne. Under the centre space described above, has been found a grave, dug in the rock, containing much black unctuous earth and charred wood. To the sober archaeologist the barrow is far more interesting than it was some months ago; but alas, the glass beads on being tested proved to be of highly glazed clay, to the confusion of the Phœnician theory! The way in which the work has been done is most creditable. Too often such remains are recklessly destroyed—rifled of their contents, and then levelled or carelessly covered in. We have known several instances of so-called giants' graves broken up for farm-buildings! It is fortunate that Bollowall cairn has been rescued by the same hand which has just lately restored the St Just *plan-au-quare*, amphitheatre for miracle-plays, about which we may perhaps by-and-by say a few words.]

HER FATHER'S DAUGHTER.

IN FOUR CHAPTERS.—CHAPTER I.

THE scene is a prettily furnished sitting-room in Bloomsbury Square, London, and the time nine A.M. on a bright spring morning. Two young people—husband and wife evidently—are seated at breakfast; but the meal is so far advanced that they have both turned to their newspapers, or rather to the one paper, which they have divided between them. She, strange to say, is immersed in the City article of the *Morning Clipper*. He is fuming to himself over a critique on the new comedy produced last night at the Variety Theatre. She is a handsome blonde of two-and-twenty. He is a tall, thin, rather melancholy looking young man, who has just seen his four-and-twentieth birthday.

'Veronicas down again one-eighth!' mutters Mrs Rivers. 'They have been sinking every day for the last fortnight. They used to be a favourite stock with papa. I hope he has not dipped deep in them of late.'

'And they dignify this rubbish with the name of criticism!' cries Gerald in disgust, as he flings away his paper and turns to his cold coffee. 'A more unfair and one-sided attack was never penned. But if Babcombe were to write like an angel, the *Clipper* would stab him all the same; and if he were to write as badly as—as I do, the *Pharos* would be sure to treacle him; so that one always knows what to expect.'

Presently the postman's knock was heard, and a minute later a slatternly maid-of-all-work brought up a letter for Mrs Rivers and a sealed packet for Gerald.

'A letter from papa! I should know his queer cramped hand anywhere,' cried Alice. 'Good news or bad, eh, Gerald?'

'My story back from the *Piccadilly*!' groaned poor Gerald, with a visible lengthening of his already long face. 'Was ever such luck as mine? I shall begin to think soon that I am only fit to break stones by the roadside.'

But his wife did not hear him. She was lost in her letter. Her face paled a little as she read, and presently the tears sprang to her eyes. 'Just like papa!' she cried. 'I might have known what his answer would be. I felt sure at the time that my letters would be of no avail, but I could not rest till I had written. Even though he refuse to see me himself, he might at least let Carry and Grace see me once now and then!' She got up suddenly, and pushing the letter across the table to her husband, she hurried out through the folding-doors that opened into the bedroom. Gerald Rivers took up his wife's letter and read as under:

MY DEAR ALICE—I found your two letters awaiting me on my return from Mentone. As they both refer to the same subject, one answer will do for the two. In both of them you ask me (*implore* is the word used by you) to forgive you. To this I reply that I have nothing to forgive. You are of age, consequently you are the mistress of your own actions, and I have no control over you in any way. But when you ask me to see you, or, if I will not do that, to allow you to visit your sisters, you put the case on an altogether different footing. To both your requests my answer is an emphatic No. In the most important step of your life you have chosen to act in direct opposition to my frequently expressed wishes, and as a matter of course you must put up with the consequences of your folly. One of those consequences is the severance of all ties that bound you to me as a cherished member of my family. You discarded your family of your own free-will, and your family now discard you. Such being the state of affairs between us, I need hardly tell you that any letters you may send in time to come (except in a case of urgent illness, and accompanied by a medical certificate to that effect) will remain unanswered.—Your father,

EDWARD CREWDSON.

P.S.—Since writing the above, a fresh thought has struck me. You know that it was my intention to have given you six thousand pounds as a wedding portion had you married in accordance with my wishes. Now, I promise you that I will overlook the past, and give you the six thousand pounds into the bargain, on the day that you or your husband can come forward and produce another six thousand to put to it. That chance, I give you. A bargain's a bargain. E. C.

'The old boy might as well ask me to jump over the moon as to find six thousand pounds, or six thousand pence either,' said Gerald with a sigh as he laid the letter on the table. 'Alice always said that he was full of eccentric whims and notions, and this proposition of his proves that she was right.'

Presently Mrs Rivers came back into the room, and placing her hands on her husband's shoulders, stooped over and kissed him. She had been crying, and her eyes were still red; but there was a smile on her lips. 'Just like papa, dear,' she

said. 'So inflexible, so self-willed. Nothing can move him when once he has made up his mind.'

'There is one consolation,' said Gerald. 'We are no worse off than we were before.'

'Not a bit.'

'You see what you have brought yourself to through marrying a pauper.'

'Through marrying the dearest and best fellow in the world!' This with another kiss.

'Our future can hardly be said to be *coulour de rose*.'

'Suppose we form ourselves into a committee of ways and means?'

'Agreed.—I vote that you take the chair.' So Alice went and sat down in the big easy-chair opposite her husband.

'Three months ago to-day we were married,' said Alice. 'On that day our joint capital consisted of three hundred pounds. Yesterday I looked at our bank-book and found that we had just one hundred and ninety-nine pounds six and sixpence standing to our credit.'

'So that we have spent a hundred pounds in thirteen weeks?'

'Precisely so. But you must remember that out of that hundred pounds were paid the expenses of our wedding trip.'

'If we go on living at the same rate for six months longer, we shall be bankrupt.'

'Something not far from it.'

'Then the sooner I look out for a situation of some kind, the better for both of us.'

'But long before the six months are at an end, your novel may be brought out, or your comedy accepted, or—'

'My dear Alice,' interrupted Gerald, 'where is the use of our deceiving ourselves any longer? Three months ago we became man and wife. You brought as your dowry three hundred pounds in hard cash—the little fortune left you by your grandmother. I brought—What? A bundle of wretched manuscripts, that were fit only for the buttermilk.'

'O Gerald, don't say that!'

'A bundle of wretched manuscripts,' reiterated Gerald bitterly, 'comprising, among other useless matter, a novel and a comedy. I was going to do grand things: to set up in life as a man of letters; to make a name for myself; to earn an easy and lucrative living with my pen. Icarus has come down with a crash. No publisher will offer me a penny for my novel; no manager will read a line of my comedy. I have the consolation of knowing that I have mistaken my vocation; that I am not nearly such a clever fellow as in my folly I fancied myself to be; and that I have been living all this time on my wife's money, for lack of any of my own.'

'O Gerald!'

'In three months I have earned twelve guineas—twelve miserable guineas. During the next three months I may earn as much more, or perhaps nothing at all.'

'You must not lose heart in this way, dear. What are three months? A very little time indeed. Remember how *Jane Eyre* was hawked about from one publisher to another before any one could be found to accept it.'

Gerald shook his head. 'My dear Alice, your husband is not a man of genius, and no one knows that better than yourself. I made the mistake,

common enough, I daresay, among young men who have an itch for scribbling, of believing that the world would appraise my literary wares at the same value that I set on them myself. Three months in London, three months among publishers and managers, have sufficed to undeceive me once and for ever. The lesson has been a sharp one; but I hope I am man enough to own that I think it has done me good.'

'How bitterly you speak, dear! What can I say to comfort you?'

Gerald rose from his chair and crossing to where his wife was seated, he took her hand and pressed it to his lips. 'You are my comfort now and ever,' he said. Then, with his shoulders resting against the chimney-piece, he went back to what he had been talking about. 'Another fact my lesson has taught me,' he said, 'and that is, that there is no present prospect—and whether there is one in the future seems highly problematical—of my being able to keep you and myself, by the proceeds of my pen, in anything more than the most abject pauperism. Such being the state of affairs, you cannot fail to agree with me as to the absolute necessity that exists for my at once setting about some other mode of earning a living. The only question is: What is that mode to be? In other words, what am I fit for?'

'What are you fit for, indeed! Why, anything and everything. With your abilities—'

'My abilities, forsooth! Where are they? In what do they consist? Would the exercise of them in any direction bring me in a hundred a year? Really, Mr Chairman, really you are most unpractical this morning, and wanting in your usual sagacity.'

'You don't know what you can do till you try, dear. Your abilities have never been properly put to the test.'

'There's the mischief of it. If my uncle, instead of bringing me up to a life of idleness, and luring me on with the hope of one day being his heir, had insisted on my being taught some decent trade or profession, I should not be in the predicament in which I find myself now. Seriously, *cara mia*, what am I fit for? I know nothing; have been taught nothing; and have no special aptitude—unless it be for a little foolish scribbling—by means of which, as already proved, I might perhaps earn enough to find you in gloves and myself in cigars. But where is the bread-and-cheese to come from?'

'We have several months before us yet, dear, during which we can look out and consider what it will be best for us to do.'

'And in the meantime your money—yours, Alice—which ought to have been put away untouched, is melting day by day. And there's a sting in knowing that.'

'You foolish Gerald! As if both my money and I were not your own to do as you like with!—How would it be if we went into less expensive lodgings? These rooms are very dear.'

'What are these rooms in comparison with the home you gave up for my sake?' He put his arms suddenly round his wife's neck and kissed her. 'Something must be done and at once; but what that something must be, I know no more than the man in the moon. You with your clear head must try to think for me. I will leave you now. I am going to the Museum to get up my

references for an article I intend writing for *Mayfair*.'

Left alone, Mrs Rivers had another little cry all to herself. Then she bathed her face, and after that she took up her father's letter and read it through slowly and carefully. 'Six thousand pounds!' she murmured to herself. 'If I could but take him that, he would forgive me, and put another six thousand to it. How he must have laughed to himself as he wrote those words, knowing how utterly unlikely it was that such a miracle should ever happen!'

Ordinarily one of the most active of young housewives—if a lady who merely occupies furnished apartments can be called a housewife—Mrs Rivers, this morning, never stirred out of her easy-chair till Gerald came home to luncheon. She put away her father's letter as her husband opened the door. 'Gerald, dear, do you know anything about the electric telegraph?' was her first question.

'Theoretically I know something of it from books; practically, I know nothing.'

'Then you could not send a message by it, say from one station to another?'

'Certainly not; not if my life depended on it.'

'But you could learn?'

'I suppose so, should the necessity for my doing so ever arise.'

'I wish you would learn.'

'With all my heart, if you particularly wish me to do so. Though I certainly fail to see in what way such knowledge could ever be of use to me.'

'It may be of use to you—of very great use; and I want you to begin to take lessons to-morrow. I see from the newspapers that there are one or two places where telegraphy is taught as a regular branch of knowledge, so that it need not take you long to learn.'

'Good. But may I ask?—'

'Nothing at present. Like a good little boy, you must shut your eyes and open your mouth, and see what your wife will give you.'

One afternoon, some two months later, Gerald Rivers put into the hands of his wife a certificate of proficiency from the school of telegraphy, at which he had been taking lessons for several weeks past. Alice's eyes sparkled as she read it. 'To-morrow morning, dear,' she said, 'I shall go and see my god-father, Sir Charles Stopford.'

CHAPTER II.

'Why now! What, what! Just say that over again, will you?'

The speaker was Sir Charles Stopford, and the person spoken to was his god-daughter, Mrs Rivers. Sir Charles was a City magnate who had been knighted during his mayoralty some years previously. He had been very fond of Alice, in a god-fatherly sort of way, and had been greatly shocked by the news of her mésalliance. This was the first time they had met since that deplorable event.

'Just say that over again, will you?' repeated Sir Charles.

'You are chairman of the Easterham Junction Railway, and in that capacity you can doubtless do what you like on the line.'

'Quite a mistake, my dear—quite a mistake. There are three or four members of the Board—I won't mention names—who are no better than stupid asses.'

'But the favour I want you to do for me is a very trifling one, and such as there can be no difficulty about. It is simply to ask of you that my husband may be appointed station-master at Leaswood Station.'

'What, what! Station-master at Leaswood—your husband? Why now, that's the station for Brookfield, your father's place.'

'Precisely so. That is the very reason—its proximity to Brookfield—why I want you to give my husband the appointment.'

'Ay, ay! I see now; I see. Letters having proved of no avail, you think that if you and your husband are down at Leaswood, you will have an opportunity of waylaying papa as he steps out of the train, and of going down on your knees and begging his forgiveness there and then. A pretty picture, and one that I should like to see!'

'How absurdly you talk, god-papa! I shall not appear in the matter at all. Everybody knows me at Leaswood, and that would never do. The last thing in the world that I should want papa to know would be that Gerald was station-master there.'

'But the name, *ma petite*, the name. Why now, your father would be sure to suspect something from that.'

'Gerald has three names. His full name is Gerald Hunstone Rivers. He would go down to Leaswood simply as Mr Hunstone.'

'There's a scheming little brain for you! I always said it was a pity you were not born a boy; so bright and sharp and all that. You're planning something now—a surprise or something. Well, well.—Mr Hunstone, eh? But there are other difficulties in the way of which I have not yet spoken.'

'What difficulties, god-papa?'

'Why, in the first place, the man whom we have now got at Leaswood is a very good fellow, and we are quite satisfied with him; and under such circumstances we don't care to remove a man.'

'Promote him. Give him more money, and send him elsewhere.'

'Well now. That's your idea. Not so bad. No, no! But even granting that we found or made a vacancy for your husband, he knows nothing of railway-work, and we dare not appoint a man who is ignorant of his duties, to the important post of station-master. In case of an accident, how could we justify ourselves?'

'My husband has an excellent knowledge of telegraphy, so that one great difficulty is at once obviated. And as for the mechanical routine of railway-work, why not put him for a month under the tuition of the man who is at present at Leaswood; and if at the end of that time, Gerald hasn't acquired a competent knowledge of his duties, I'll never call him husband of mine again.'

'Why now. Listen to her. Just like her father. No difficulties allowed to stand in her way. But really now, I don't know what to say.'

'There's no occasion, god-papa, for you to say

another word. I look upon the matter as finally settled. I shall bring Gerald to see you to-morrow morning, and you will send him down to get initiated into his new duties as soon as possible.' She went over and kissed him, and then sat down on his knee, as she had done many a time when a girl.

'Pon my word, there's no putting you off,' he said. 'But what a sad foolish thing that marriage of yours was. I was never more astounded in my life than when I heard of it.'

'A sad foolish thing was it, god-papa?' asked Alice quietly. 'That depends altogether on the point of view from which you look at it. To me, now, it seemed the wisest and most sensible thing that I could do: to marry the one person in the world whom I felt I could love, and who, I was convinced, loved me in return. How much more sad and foolish it would have been had I not made sure of my happiness when it lay there ready to my hand!'

'Ah, well, well. You view everything through Love's rose-coloured spectacles. But it's a colour that soon fades—won't stand the wear and tear of everyday life.—So papa won't forgive you, eh? I cannot wonder at it.'

'He will forgive me when I go to him with six thousand pounds in one hand, and my husband in the other.'

'So, so. He's fixed his price, has he? Just like him. But there's not much chance of your husband saving six thousand pounds while he's station-master at Leaswood, eh, now?'

'No; I suppose not,' said Alice as she rose to go. 'But I don't forget a certain favourite proverb of yours: "There are more ways of killing a dog than hanging him." And I don't despair.'

SOME EXPERIENCES OF AN IRISH DOCTOR.

Do not fear, kind reader, that I am about to inflict upon you any 'interesting cases' with their symptoms and treatment, or any dry or technical details, such as find their proper place in the *British Medical Journal* and kindred publications. No indeed. I mean to keep as clear as I can of strictly professional matters. My purpose is merely to mention some of the difficulties which a doctor is likely to meet with—at least in my part of the world—and for which his college training and practice in the hospitals hardly prepare him; difficulties arising from the habits and prejudices of the persons he has to deal with, and the nature of which will, I believe, be made sufficiently clear by the few illustrations I shall give.

I am the dispensary doctor of Kilmany, a place in one of the northern counties of Ireland. The district under my charge is a rather extensive one, mountainous, and with a large number of poor persons in it. To these it is my duty, on receiving the proper ticket, to give the necessary advice and medicines; and it is of my difficulties amongst them principally that I intend to speak. There are two kinds of tickets or 'lines' issued by members of the dispensary committee—the 'black line' and the 'red line.' The black line entitles the patient presenting it at the proper time at the dispensary, to have his case considered and the proper medicine supplied to him. The red line requires the doctor to attend at the

patient's home. Now the first thing is of course to find out what is the matter with the applicant for medical aid. Take the case of a black line. If the patient attends in person, as he ought, well then, there is a chance—not by any means a certainty—of finding this out. But suppose a messenger is sent with the line, then you have to trust to description, and now difficulties begin. 'What is the matter?' you ask. Well, suppose the answer is: 'It's a water-brash, doctor,' or 'It's the hives,' then you have something to go on, always supposing that you can trust your informant. But the case is not so clear when you are told that it is a 'wind-brash' or the black hives; and the matter becomes more obscure if possible, when in the latter case it is added that they have 'struck in about the heart,' a most dangerous symptom as it is thought; or it may be 'a narvous wind' the patient complains of, the worst 'narvous winds' being those which 'work about the head.'

There is no medical work in existence treating of these diseases. But now, suppose you are so fortunate as to know, for example, what black hives are, and that you are able to accept the statement that they have struck in about the heart, even still the course is not clear. You have to deal with some very vague notions of anatomy. If it is a leg or an arm, a foot or a finger that is mentioned, you can trust so far, but not much further. Take that word 'heart,' for example. I remember Paddy Doyle telling me one morning—Paddy was a handy fellow who used to do odd jobs for me about the house and garden—that his father had bought a calf in Ballyboo Fair, but that he feared it would do little good with him, as it had got straws, he thought, in its heart.

'Straws in its heart!' I exclaimed. 'What nonsense! How could straws get there? And if they did, the calf would not live five minutes.'

'O yes,' he replied; 'plenty of them has straws in the heart; but it's rare that they do any good.'

I was not going to argue such a matter with Paddy, and said no more. But two days after he informed me that the calf had died, and that on cutting it open they had found, as they suspected, straws in its heart; adding that 'it's ill done to buy a calf you are not acquaint with, for it's few knows what's in the inside of a strange baste.' After a few questions, I found that it was the stomach Paddy meant, and that the word 'heart' was used in a general kind of way for the inside, the centre—as we speak of the heart of a tree.

But suppose it is a red line, or that the patient himself has brought the black one, your difficulties though lessened have not disappeared.

'What is wrong with you?' I asked of Jack Scrimgeour, to whose house I had gone to see him.

'Aren't you the doctor?' he replied in a surly tone.

'Yes; of course I am,' I answered.

'Well, of course I won't tell you,' he rejoined; 'that's just what I sent for you to tell me.'

A case such as this, where the patient refuses to give you any information, is, I confess, a rare one. Generally the sufferer is communicative enough, the difficulty being to make out the meaning of the strange expressions and illustrations used. Sometimes one meets with quite 'a wealth of description.'

SOME EXPERIENCES OF AN IRISH DOCTOR.

'What's the matter with you, Mrs M'Crea?' I asked a wiry and active old woman whom I was visiting.

'Augh! Is it what's the matter with me, doctor dear, that I'm to tell you? A dale easier I'd find it to tell you what's not the matter with me—I'm just all wrong the gither.'

'Well, but is there a pain anywhere? Come, tell me how you feel,' I said.

'Is it how do I feel, doctor?' she answered. 'I can hardly spake to tell you; but I just feel a-rugging an' a-tugging, an' a-withering an' a-squeezing, an' a-roasting; an' a-swamping, an' gif I were a-carding.'

I am happy to say that Mrs M'Crea recovered from a sickness of which these were the alarming symptoms.

But now suppose you have discovered exactly what it is that is wrong with your patient, that you have prescribed the proper remedies, that you have given your instructions clearly, and have taken care to see that they were understood. Your course is clear now, you think. No mistake could be greater. I do not speak of the ordinary errors, neglect or carelessness, which hinder the means used from taking proper effect. But there are disturbing elements, which probably you have omitted altogether from your calculations. You have given such and such medicines. Well, how do you know who will take those medicines, or whether any one will? Shortly after coming to Kilmany, my eyes were rather opened on this subject. It was the day for attending at the dispensary. I had for some hours been giving out the proper medicines to those present. The hour for closing had come, and I had left the place, and was walking through the village towards my house. Suddenly a heavy shower came on. I had no umbrella, and turned for shelter into an archway, at the further end of which there was a chest, on which I seated myself. I had not been a couple of minutes there when two of my patients, who had just come from the dispensary, entered the archway for the same purpose. As the end where I sat was dark, they did not see me, and turning their backs towards me, they began to talk.

'Well, Jinny, what do you think of the new doctor?'

'Sorra a much I think of him at all, Peggy! He would not stand to hear the half of my complaint, and he gave me the wrong medicine entirely. What was it he gave you, Peggy?'

'It's a bottle, Jinny. I'm to take it three times a day, he says. There it is; and it's a poor kind of smell it has about it. I tould him it was pills I wanted, and that bottles never done me any good!'

'Well, it's pills he's give me,' said the other, 'and I can't take them at all. But I can take a bottle rightly. I'm thinking we'll swop. Fien a bit wiser the doctor'll be;' and they exchanged their medicine then and there. The shower was over; Peggy and Jinny were leaving the archway without having discovered me, the former saying as she went out: 'I suppose I'd best take the pills three times a day, the way the bottle was to be took.' They were rather startled by hearing me remark that it would be as well to follow the doctor's advice on the point.

Administering the wrong medicine is of course

a more dangerous proceeding than merely failing to administer the right one; though this is bad enough, and very trying to the temper of any doctor who is anxious about and interested in his cases. I may mention an instance of this which occurred also shortly after I came to Kilmany. Old Mulloy, whose house was about four miles distant from the village, held a small farm, valuable enough, however, to raise him above the class of persons entitled to receive medical aid gratuitously. One of his daughters—Marianne, a girl of about eighteen or twenty years of age—was seriously ill. I had prescribed for her, and I called a few days after to see how she was getting on. As I entered the house I saw several members of the family sitting round the fire in the kitchen. They looked up, but did not move from their seats, or shew any of that politeness which one meets with usually even in the houses of the poorest. I thought their conduct strange; however I inquired how the girl was. No answer. So I asked again: 'How's Marianne to-day?'

'Umph!' said the father in a gruff voice without looking up. 'Not much better.'

'What!' I said; 'is there no improvement?'

'Sorra a bit!' was the reply in the same sulky tone.

'How's that?' I asked. 'Did she take the medicine?'

Again no answer. I repeated the question.

'Troth and she did not, doctor,' the father replied with emphasis.

'And why was that?' I inquired.

Then Mulloy rose up, and with an expression of indignation on his face he said: 'Biddy, fetch out that cat.'

Biddy did as she was told—at least she opened the door of a cupboard that was in the wall, and there bounced out of it something like a half-roasted hare; an animal without a bit of fur on its body, and of a dull patchy slate-colour. As it fled with something between a yell and a mew across the floor and out of the house, old Mulloy pointed sternly towards it and said: 'No! by the blessing of Providence we tried your powders upon the cat, or that's the way our Marianne would have been this day, if she had taken what you sent her!'

Sometimes the error is in the opposite direction. If the medicine is approved of, it will often be given to any other member of the family who happens to be unwell; such trifling considerations as age, sex, or even the nature of the sickness being set aside. I remember the case of an old woman who was suffering from a chronic affection of the throat. I had given her a large bottle full of, fortunately, a very innocent preparation, a teaspoonful of which was to be taken when the cough was troublesome. There was enough of the medicine in the bottle to have lasted for a month. I was therefore somewhat astonished when, two days after, her daughter appeared at the dispensary, and setting down the empty bottle, requested that it might be refilled.

'It has not begun to operate yet, doctor,' she observed; 'which mother thinks is strange, for she has give it every fair play; she has took it mornning, noon, and night since you sent it. Sorra a bite she ates but she drinks the mixture with it. She supped it with her broghen and took it in her tay!'

This is an instance of a practice common enough

of using the medicine received, in a way never intended by the doctor. I shall give another example of a somewhat different kind.

One morning I remarked that there was an unusually large number of persons in the waiting-room of the dispensary, many of them fine blooming girls, who looked as unlike persons requiring the physician as possible.

'What do you want, Maggie?' I asked of the first of these who presented herself.

'Mother sent me,' she said, dropping a courtesy, 'for a couple of doses of oil;' and she handed me a small bottle, which I filled.

To my surprise they all wanted the same. 'A little oil, doctor, if you please.' Well, castor-oil is an innocent medicine, and not likely, I thought, to be used as an article of diet. So I filled each of the bottles with the oil, wondering much what sort of epidemic this was that seemed to have at once attacked so many families. Next Sunday, on coming into the village church the mystery was solved. There was an unmistakable odour in the air, and the unusually sleek hair of many of the boys and girls bore witness to the use the oil had been put to. The next dispensary day there was quite a crowd in the waiting-room, evidently wanting oil. I was prepared for this, and announced that no persons should receive castor-oil who did not require it for their own use, and that as this was a medicine for internal and not external use, the applicant must *swallow it in my presence*. One half of my visitors left the waiting-room that day without coming into the dispensary to see me; and as they passed the window, I could perceive that in spite of their disappointment they enjoyed the joke.

There is one idea that any physician taking charge of the dispensary district of Kilmany would do well to get rid of—I mean the notion that he will be thought to understand his own business better than his unprofessional neighbours. Quite the contrary. The doctor's bottles will probably be submitted to the clergyman for approval, the parson's doctrines indeed being in return laid before the doctor to decide whether they are orthodox, if he will take upon himself such an office. But questions both of divinity and medical science will have eventually to be decided by old Mrs Featherstone. 'I would like to hear what Mrs Featherstone has to say on that point,' is the remark when the Sunday sermon is thought to have contained any dubious statement of doctrine. 'Doctors is well enough, Mrs Walker,' I happened to hear a woman remark to her neighbour, who was coming to the dispensary for the medicine her husband required—'doctors is well enough when there's nothing sarious; but I wad recommend you when he's that bad, to do nothing till Mrs Featherstone has seen him.' On another occasion to the question: 'Has the doctor seen poor Biddy?' the answer was: 'Troth no, then; nor he won't. My daughter's too delicate for the doctor.'

The following letter, addressed to the clergyman of the parish by a patient of mine, whose strong constitution had brought her safely through an attack of typhus fever, will shew that this feeling of distrust is not confined always to the poorest class. Mrs Smart was well-to-do in the world, possessing and managing successfully one of the largest farms in the district. Hearing that

the clergyman was unwell, she wrote to him as follows:

'REVEREND SIR—Being informed that you are ill, I take the liberty of writing, lest it should be as subscriber fears a case of fever, in the hopes that the experience of a typhus-fever patient may be acceptable. In the year 1865, Ann Smart suffered under typhus fever for eight weeks; the malady raged unabated; patient hot as fire within, extremities cold as ice; Dr M—— in constant attendance; took none of his medicine, but paid his bill. A basin of oatmeal flummery stood by; likewise a bowl of butter-milk qualified with two parts of water. Alternate spoonfuls supported the patient and cooled the fever. Treatment was successful, which, that it may so prove in your case, and that long you may be spared to fulfil the duties of your sacred office, is the prayer of subscriber,
ANN SMART.'

In what tendency of our nature this distrust of what is professional has its origin, I shall not inquire. Evidence of such a feeling is common enough, at least among a large class of persons in Kilmany dispensary district.

I give another instance. A patient of mine—poor old Tom Jackson—was ill of dropsy. His friends did not think well of my method of dealing with the case. In a neighbouring town there was one Peter Blain, who kept a small shop, in which tea, tobacco, some drugs, paints, garden-seeds, and rat-poison were sold. Dr Blain he was called, though he had no claim to such a designation except what was derived from selling quack medicines and rat-poison. To this person poor Jackson's friends went and explained the symptoms of the disease, the worst being, as they said, want of sleep. To remedy this, 'Dr' Blain gave them a box of opium pills, a number of which they administered on returning home. In the middle of the night I was called up to see Jackson, who they told me was dying. I perceived at once that the man had been poisoned, and on asking what he had taken, the remaining pills were shewn to me. I did all I could to save his life; getting rid of as much as possible of the poison by means of a stomach-pump; but the patient had been in a very weak and prostrate condition, and he never rallied. There was an inquest, the coroner's jury being composed of small farmers in the neighbourhood, who happened to hold some rather curious religious opinions. In the verdict they agreed upon, it was stated that no blame attached to Dr Blain, but that I, Dr M——, was guilty of manslaughter, for using a horrible engine nowhere sanctioned in Scripture!

I have mentioned the 'red line.' Most of my professional brethren in this country, however little given to speaking on other subjects, could, I fancy, be eloquent on this; for the 'red line' interrupts all a doctor's plans and occupations; it is sure to come upon him at the most unexpected times and in the most annoying manner. The dispensary doctor lives with the red line like the sword of Damocles ever hanging over him, with this difference, that while the sword did not come down, the red line is perpetually doing so. You come in late in the evening, wearied with your day's work, and hungry. You have been looking forward to a comfortable dinner, the arm-

chair by the fire, and a pleasant book ; but instead there is a red line upon the hall-table ; or you have gone to bed and have fallen into your first sound sleep, when a thundering knock comes to the door, and before you are well awake you understand that the red line has arrived. Of course these red lines are necessary, but sometimes they come under circumstances that would try the best regulated temper. I remember one dreary winter's evening reaching home tired and wet ; it had been a bleak cold day, with showers of hail and rain mixed, and a cutting northerly wind. On coming into the hall, I saw the inevitable red line, with 'Urgent' written on it. The place I was summoned to was five or six miles off, and the road to it bad and hilly. There was, however, nothing for it but for man and horse, tired as they were, to start at once. It was quite dark when I reached the house, a wretched hovel with but two rooms. I had had to leave my car some distance off and make my way to it on foot. The father and mother and some grown-up children were sitting round the fire as I entered.

'How's Molly ?' I asked at once, for I was in a hurry to get home again.

'Augh ! doctor dear, is that you ?' they said. 'But you've got the sore night to come out ; you'll be starved wid the cowl.'

'Well, but how's Molly ?' I asked again. 'I'd like to see her at once.'

'Augh ! is it Molly ? Troth, she's bad enough, and glad she'll be to see you, doctor. But take a sate at the fire, an' just warm yourself,' said the mother, offering me the solitary chair the house possessed.

'O no ; thank you ; I can't wait. I will just see what ails Molly,' I replied, going towards the door of the bedroom.

'Oh, she's not there, doctor,' they said ; 'you'll see her after a bit.'

'Where in the world is she ?' I exclaimed. 'She's not out such a night as this ?'

'Troth then, she just is, doctor,' was the reply. 'Sure, we never thought you'd come out this evening. But she'll be back in half an hour ; she just went up a while ago to the mountain for a back-load of turf.'

Some weeks I think elapsed before this affair began to appear to me in a comical light.

These few anecdotes, as they are strictly true, may serve, so far as they go, as indications of characters and mental peculiarities not unfrequently to be met with amongst dispensary patients in the north of Ireland. When I came to take charge of the Kilmany district, my predecessor was still in the place. I remember the evening before he left we walked up to the little church upon the hill, from which there was a good view of the country round. 'There have been many changes here,' he remarked, 'since first I knew the place. And it's not so very long ago either. Would you believe it now ?' he asked. 'There was hardly a grave in that churchyard when I came here, and see how full it is now !'

'True for you, doctor,' the sexton, who was standing near, remarked ; 'and you attended a'most every one of them ! You have not been idle since you came to us, doctor, that's certain !' There was a twinkle in the old sexton's eye as he spoke, and though he kept quite grave, we both laughed heartily. But perhaps the difficulties in

the way of successful practice which I have illustrated rather than described, may excuse the dispensary doctor from at least a portion of the blame.

MAGIC MIRRORS.

AMONG the most curious examples of ancient Chinese metal-work must be reckoned 'magic mirrors,' whose mysterious properties have puzzled even the learned and scientific for ages past. Both the Chinese and Japanese have long been famous for their mirrors, some specimens of which are to be seen in the Museum of the School of Mines in Jermyn Street, London ; but it is only a small percentage which possess, as the catalogue informs us, 'the very remarkable property of reflecting from their polished surface the figure which is wrought upon the back.'

Whether Chinese or Japanese, and whether indued with this magic power or not, the bronze mirror is usually circular in shape, and from three to twelve inches in diameter, the face being highly polished ; while the back is ornamented with various designs, embossed, inlaid, or engraved in the metal. So far there is nothing remarkable about it ; and though very light and convenient for use at the toilet-table, it would not attract much attention ; but if the mirror be a 'magic' one, and held in the sunlight, with its face towards a white wall or screen, it will reflect the various designs graven on the back, which will appear either as shadows upon a light ground or as lights upon a dark ground, although no scrutiny of the polished surface, however close, will enable one to detect the smallest trace of them there. The effect is extremely startling even to an educated person, and it is hardly wonderful that the uneducated should be disposed to regard it as decidedly 'uncanny.' One of the few magic mirrors now in Europe belongs to Herr Senter, and is thus described by the German writer Herr Carus Sterne.

'The mirror is of yellowish bronze, the face slightly convex, and covered with a thin coating of silvery-looking metal, which is very highly polished, and reflects with the utmost distinctness every object presented to it. The handle, also of metal, is covered with bamboo ; and the whole thing is so extremely light and comfortable to use, that as a hand-glass it is simply perfection. The back of the mirror is covered with designs of the usual description in low relief on a roughly granulated ground, which consist of a figure in the shape of a tiger, of the famous Chinese dragon Lung, resting beneath the shade of a brier in full blossom, with a few bamboo-canes growing near. Above the head of the tiger are engraved certain characters, which stand out in much bolder relief than any other part of the design, and constitute the well-known sign and symbol of the sacred dragon. To the left is a column of Chinese writing, probably a charm or the expression of some good wish ; for a bronze mirror is a very usual present, and is supposed to insure health, beauty, and happiness to the recipient. One belonging to Baron La Grange, and described by M. Stanislaus Julien, bore the words *cheou*, long life, and *fou*, happiness.'

Herr Senter's mirror, when held in the sunshine as we have described, reflects from its

polished surface the tiger and the rest of the design with great distinctness; the figures, which it must be remembered are engraved on the back, appearing as bright lights on a shaded background.

The Chinese call these toys *Théou-Kouang-Keen*, 'mirrors which let the light through;' and as the rare specimens which exhibit this phenomenon in perfection are worth from ten to twenty per cent. more than the others, the workmen are not at all anxious to enlighten either foreigners or even their own countrymen as to the way in which it is produced. Accordingly, there is little trustworthy information to be obtained from Chinese writers on the subject, though various theories have from time to time been advanced in explanation.

It is only quite recently that the mystery respecting them has been solved, and this perhaps because people have experimented upon the various ways in which the mirrors might be manufactured. It has been found that there are several methods by which it is possible to cause differences in the reflection from a metal surface, which shall be visible only in the reflection and not as directly detected by the eye. It is found that designs etched, engraved, or stamped on a plate of metal, and then rubbed down and polished till they have entirely disappeared from sight, will still come out in the reflection; and a similar result has been obtained by tracing a design with transparent varnish on the back of a plate of glass. Old coins exhibit analogous appearances; and most collectors know that old worn specimens, if placed on a metal plate in the dark, and brought to a red-heat, will exhibit the design and inscription which had previously become obliterated. A brass-worker who had heard Professor Pepper lecture on this subject at the Polytechnic, brought him some time afterwards an imitation of a magic mirror made by himself. He had taken a plate of common brass, and stamped it with an engraved die three times, in exactly the same spot, polishing it down again each time; and after the third operation, the design, though not to be detected by any method of direct examination, yet came out plainly in the reflection. Both Sir David Brewster and Sir Charles Wheatstone were of opinion that the phenomenon of the magic mirror was produced in some such way as this, and that the figures on the back were merely used for the purpose of making the observer deceive himself, and had absolutely no connection with the reflection. This theory, however, is now upset by the discovery of a remarkable fact first observed by Professor Atkinson of Japan—namely, that a mark made with a blunt nail on the back of one of these mirrors, though producing no visible effect upon the polished face, was yet reflected as a bright line on the screen, when the mirror was held up in the sunshine!

Japan is, even more than China, the land of mirrors; and as mirror-worship forms part of the popular religion, and plays so important a part in the national life, it might be thought there would be little difficulty in investigating their 'magic' properties. But this is not the case; for the Japanese seem to know less about magic mirrors than any one else, and are apparently ignorant as to how the effect is produced. Professor Ayrton has, however, successfully solved the mystery, and

has proved by a series of experiments, too long to detail here, that the reflections are caused by certain imperceptible inequalities in the curvature of the polished surface. No thick mirror reflects the design on the back; not one of the many beautiful mirrors exhibited at the National Exhibition of Japan in 1877 did so in the slightest degree; yet the patterns were not less well executed than on inferior specimens; but the mirrors were far thicker, and their surfaces much less convex. On further investigation he found that in order to give the desired amount of convexity to their mirrors, the Japanese place them on a board, face uppermost, and indent the surface with a blunt iron called a 'distorting rod.' Several series of scratches are made in different directions, the mirror being during the operation visibly concave, though eventually becoming convex. The metal receives what is technically called a 'buckle,' and springs back again so as to become convex directly the pressure of the rod is removed. Naturally, the thicker parts of the metal would be less impressionable than the thinner, and might even not spring back at all, but remain concave. After being polished with whetstones and charcoal, to remove all trace of the scratches, the face is finally rubbed over with a mercury amalgam.

We must confess that, even with the proof before us, it does seem marvellous that inequalities so small that the eye entirely fails to detect them, should be able to cast upon the screen such sharp and clear reflections as are witnessed in a good specimen of the magic mirror; but so it undoubtedly is; and the phenomenon receives further confirmation from Professor Ayrton, who thus concludes his lecture: 'It appears then, contrary to what is commonly believed, that the magic of the Eastern mirror results from no subtle trick on the part of the maker, from no inlaying of other metals or hardening of portions by stamping, but merely arises from the natural property possessed by certain thin bronze of buckling under a bending stress, so as to remain strained in the opposite directions after the stress is removed. And this stress is applied partly by the distorting rod, and partly by the subsequent polishing, which in an exactly similar way tends to make the thinner parts more convex than the thicker.' So then, as often as not, the 'magic' properties which have caused so much perplexity may be, at least in Japan, the result of pure unconscious accident.

LOVE'S CALL.

SHY tender stars sedate and sweet
Round weary Earth's pale pillow press;
Night cloaks her at the golden feet,
And they are shod with silentness.

Tranced in a weird colossal dream,
The mountains shadowy arms outfling;
Around, the silent forests gleam,
And every leaf is listening.

What distant call? What sudden-stirred
Echoing thrill from breast to brow?
Was it the nightingale I heard?
Or was it, best beloved, thou?

TAKING THE BULL BY THE HORNS.

THERE are two proverbs which seem to be a distinct contradiction of each other—'Delays are dangerous,' 'There's luck in leisure.' Both proverbs, however, are true, according to the circumstances in which they may respectively be applied. Sometimes, and more particularly when a sudden and unpleasant emergency arises, it may be safe and desirable to act with promptitude, or at all events not to procrastinate. On the other hand, there are occasions when people should take matters leisurely, and avoid plunging into a course of conduct that only by some rare chance will prove successful. It is not easy to offer any advice on the subject. The exercise of a sound judgment in relation to ordinary experiences will determine whether it is best to delay or to act on the spur of the moment.

Personally, we have always had an objection to put off time in following what appeared to be the line of duty, and on the whole feel that in the aggregate more mischief is done by taking things leisurely than by promptitude of action. Obviously, procrastination is something more than the proverbial 'thief of time.' Wasted energies, neglected opportunities, mental idleness, and general disorder of affairs, resulting in a dropping behind in the race of life, constantly rise up in accusation of the evil habit of putting off till to-morrow what could be and should be done to-day. Every one has duties to fulfil, and the most fortunate of mortals has need of sustained energies; but energies are frittered away by small frequently occurring emergencies far more than by employing them vigorously in some really important matter. Figuratively speaking, when a wise man has a trouble which can be removed by promptitude, he loses no time in 'taking the bull by the horns.'

How often do people drift into a sea of troubles just because clear decision and vigorous action have not been forthcoming at some critical moment! Even the typical wise man makes mistakes

sometimes, and has brought the figurative 'enraged bull' down upon himself; only he, instead of crouching before it or attempting to fly, turns and 'takes it by the horns.' He is not ashamed of owning his error. If he finds himself deceived in the purport of an engagement into which he has been entrapped—be it the hiring of a house, the partnership of a business, or any of the multitudinous arrangements which complicate modern life—if he finds he has entered on a disastrous course which admits of no remedy while it is pursued, he will at the sacrifice of anything except honour, extricate himself from it without delay. The unhealthy house, the inconvenient house, or the house too large and expensive will always prove a depressing influence, and will have to be given up sooner or later. If there are smoky chimneys and damp rooms, remedy them if you can; if you cannot, don't drift into a condition of chronic discomfort for want of prompt action and temporary sacrifice. To know when to make a sacrifice, and to be prompt in acting upon that knowledge, is a great secret of success in life.

And now we would say a word on a very important theme. Young people often rush into matrimonial engagements with far too little understanding of each other's disposition and tastes. If longer acquaintance and more intimate knowledge, instead of cementing the tie of affection, opens the eyes of either of the pair to the incompatibility of their characters, surely it is the truest honour to speak the frank word before the irrevocable vows are taken. Though it is the duty of married people to bear and forbear, there are limits to human endurance which cannot be passed without serious injury of many sorts; and where incompatibility is detected before marriage, there is a great chance of its developing, not decreasing afterwards. To break a matrimonial engagement is a terrible evil to encounter; but still it is better to make the effort, than with eyes open to incur lifelong misery.

We remember long years ago reading a quaint rhyme, which we have never met with since. We think it ran thus:

For every evil under the sun
There is a remedy, or there is none;
If there is one, try and find it;
If there isn't—never mind it.

Though to indulge in vain regrets for the inevitable may be weak, and even sinful, it may on the other hand be a proof of moral strength, and the very exercise demanded of us—to resist evil by the means within our reach. It is true that social life in the present day is exceedingly complicated, so that it is perhaps more difficult to get out of a wrong groove than it was a generation back; but that is no reason why the attempt should not be made. Letting things 'drift'—a favourite axiom with many people—often leads to the wreck of fortune. Of course there are times when the most energetic must exercise patience, and wait for the turn of that 'tide' which they wish to 'take at the flood.' But the really energetic are vigilant even when inactive, and generally speaking, they do not have to wait very long for their opportunities.

We heard a story lately which interested us greatly, as a striking instance of 'taking the bull by the horns.' As the consequence of an unfortunate speculation, a family was suddenly reduced from affluence to penury. The blow was a terrible one, and for a brief period the whole family seemed paralysed; but it was the noble-hearted wife who first roused herself, and bravely prepared to act with decision. The only pittance which remained was less than a hundred a year, and this for people who had been accustomed to horses and carriages, and to fare sumptuously every day, and with seven children to feed and to clothe! Of course the father looked out for employment which should in some measure re-establish his position; but fortunes are not re-made in a day or a year; and his wife, delicately reared and accustomed to a large establishment, resolved as a first step to discharge every one of their servants. 'We have health and we have hands,' she said; or at anyrate used words to that effect in speaking to her children. 'We must work; and what we do not know how to do, we must learn.'

Of course the first thing was to remove to a small house, one only just roomy enough to contain its several inmates. But not even a 'general servant' accompanied them. A frugal system of diet was adopted, in which we believe oatmeal played a considerable part, and every purchase was made in the cheapest market. This rare lady had a horror of debt and a horror of pauperism, though she had not the ungrateful pride which would have made her decline all help offered to her children. They were helped to help themselves in more ways than one; and when the darkest days were over, and the 'silver lining' of the cloud began to shew, there is good reason to believe that she felt more of the good that had been hidden in the trouble. After all, the time was not so sad as it seemed. We may be pretty sure that it sifted friends in a wonderful manner, and that it was found that the true and the loyal were to be met with in all classes. Some acquaintances of course dropped off; but it is doubtful if adversity tests friendship more than does prosperity. The rich and happy are much envied, and sometimes slandered; but the best feelings of the best people are generally

drawn forth towards those in trouble. We fancy too that the brave lady of whom we are writing did not allow herself to be ashamed of her poverty. If people whom she had visited in other days on equal terms, drove up to her door, we imagine she received them in her little parlour without any lachrymose manner; though perhaps, if very busy starching or ironing, she kept them waiting a few minutes, making due and truthful apology for doing so. Under such circumstances, it is very likely that her hand, though rough and hard from household work, was pressed with more than usual warmth by delicately gloved fingers.

Now, if that wife had been content to sit bemoaning her helplessness and misfortune, while appealing right and left for aid, what an inferior position would she now be in! not only in reference to worldly affairs, but in regard to the estimation of her character. Besides, energy is very contagious, and hers must not only have cheered her husband in his trouble, but must have been communicated to her children. The constant occupation too was the very best thing for them all; it left no time for mere fretting; and probably natural fatigue from physical exertion prevented anxious thoughts from keeping them awake at night. No doubt our heroine was very glad when brighter days dawned again, and she could return to more congenial occupations than sweeping rooms and lighting fires; but we believe she would do just the same as before, should the same terrible occasion recur.

Perhaps it is only when we are somewhat advanced in life that we see with any clearness of mental vision the 'uses of adversity.' It is when we can look back on the sundry beginnings and endings of things—on the completed careers of the successful—and on the ultimate triumph of good over evil in the multitude of cases within our knowledge, that we begin to perceive how necessary trials to be encountered and difficulties to be overcome are to the strengthening of character and the development of the human being.

THE BRAVE SWISS BOY.

CHAPTER III.—THE CHAMOIS-HUNTERS.

EARLY the next morning the door of the little mountain cottage grated on its hinges, and Mr Seymour entered the small apartment, eagerly welcomed by Walter, who ran forward to meet him.

'What! you are up already, my boy, and as fresh and lively as if nothing had happened!' said he. 'I fully expected to find you knocked up and ill after all the exertion and fatigue of yesterday; but I am glad to see that you are so much stronger than I gave you credit for. How is your back though, Walter? Don't the wounds made by the vulture's claws pain you very much?'

'They were very sore last night sir,' replied the boy; 'but father bound them up nicely for me, and says they will be quite better in a week.'

'Delighted to hear it. But where is your father? I don't see him.'

'He is outside sir, with Liesli the cow, that we

recovered through your kindness,' replied Walter with a grateful look. 'She is the best cow in the valley.'

'Ah, here comes your father,' said Mr Seymour with a smile, stepping forward to grasp the hand which Toni Hirzel held out towards him, while thanking him in hearty but simple words for the kindness he had shewn to his boy.

'Don't mention it, my friend. What I gave to the boy was given very willingly; and he has richly earned not only that but a few francs more, which I am still owing him. But we will square accounts now.—Here Walter; there is forty francs for the old vulture which you captured so bravely; and here is another sixty francs for the torn trousers and the knife you lost.'

With these words Mr Seymour counted out five bright gold pieces on the table, to the wonderment of Toni Hirzel and his son, neither of whom could utter a word.

'But sir,' exclaimed Walter, finding his voice at last, 'the vulture, the trousers, and the knife all put together are not worth twenty francs!'

'They are worth more to me,' replied the gentleman; 'and you must allow me to pay for them according to my opinion of their value. So make no more words about it, my boy, but put the money in your pocket. I hope it may prove useful to you.'

Tears started into Walter's eyes. 'O father!' he exclaimed, 'only look at all this money! We shall be able to buy another cow and make twice as much cheese as we do now. We shan't have to borrow anything from neighbour Frieshardt any more, and if everything goes on well, we shall soon be able to build a house as good as his. It will be a blessing for you to have a comfortable home in your old age.'

But Toni Hirzel shook his head. 'Don't talk so fast, my boy,' said he quietly. 'That is a great deal more money than we can think of taking.—Pray, take it back, Mr Seymour. Watty is quite right. Twenty francs will amply suffice; especially when you were so liberal towards him yesterday.'

'Very well, friend, so be it,' was the reply. 'If you won't let me pay you the money as a debt, I hope you will allow me to give it to Walter as a present. I'm sure you won't object to that. He can save it till he's a few years older, if he doesn't require to spend it now; so let the matter drop, unless you really wish to annoy me.'

Seeing that Mr Seymour was in earnest, Toni Hirzel made no further objections, and lifted the money from the table.

'Well then, Walter, I will take care of this handsome gift for you until you are old enough to make a good use of it,' said his father, as he placed the money in a leather pocket-book, which he deposited in a secret drawer of the cupboard. 'Rest there quietly,' said he in a whisper; 'when I am dead and gone, it will be a nest-egg for Watty to fall back upon.'

Mr Seymour then rose to take his departure; and before saying farewell, Walter asked and obtained leave to visit the friendly traveller soon; but when he went to Rosenlanibad three or four days afterwards, he found that Mr Seymour had received a letter from home, which had compelled him to take his immediate departure.

The summer passed away; autumn came, and stripped the leaves from the trees; the first flakes of snow fluttered in the air; the days were growing shorter, and the quiet and solitary valley took its turn in the changes of fortune which so frequently occur in the outer world. Although Toni Hirzel was sober and industrious, he could not escape the common lot of humanity. He sustained a heavy loss at the beginning of winter in the death of his favourite cow. Soon afterwards, the severity of the weather drove from the mountains the wolves, which broke into the stable during the night and killed two of his five goats.

These losses were serious to the poor man. The only property he possessed in addition to his cottage consisted of the cow and the goats, which supplied him with the barest necessities of life; and now he was deprived of them almost at one stroke. It was hard to bear; but by-and-by the recollection of the money which Mr Seymour had given him came as a ray of sunshine to Walter, who begged his father to take it and buy another cow.

'No, Walter,' was his reply. 'The money is yours. Mr Seymour made you a present of it, and it shall remain untouched until you are old enough to spend it for some good purpose. You are too young and inexperienced yet; so don't say any more about it. Now that we have lost Liesli and the goats, we must bestir ourselves to do something else for a living, until the spring, when we may perhaps be fortunate with the chamois. There are plenty of chamois on the hills, and my gun on the wall there has brought down many a fine buck! When spring comes, we'll go out together, and you will see that your father has still a firm hand and a sure foot.'

The winter wore away by degrees. The warm south wind crept slowly through the valleys, melting the snow from the mountain-sides, and calling into life hundreds of sparkling streams. Waterfalls foamed and thundered; enormous masses of snow came crashing down from the mountain peaks; while amid the noise and thunder of avalanches, the sun exercised its silent but mighty influence, renewing the mountain greenery, converting the barren ground into a verdant carpet. The birds returned from their winter home, and again burst into joyous song; and again the budding trees proclaimed that winter was over and gone.

During the dreary winter-time the simple wants of the two mountaineers had been supplied by much toil and much privation, so that the return of the vernal season was hailed with joyful acclamation.

'It is time for us to be off now,' said the hunter one morning to his boy; and day after day, whenever the weather was favourable, they might have been seen climbing the lofty mountain ranges in search of game, sometimes not returning to their little cottage for several days. At other times, however, after unspeakable trouble and danger, they would return home in great glee, the father bearing a large chamois slung across his shoulders, to be sold for a good price to the landlord of the inn.

Toni was looked upon by all the country round as the best hunter in the district, and he was determined to maintain his reputation. By the end of August, when the summer was approaching

its end, he had shot thirty chamois, and the best of the season was still before him.

'Now Watty,' said he, 'we must look out for the winter. We have got on famously through the fine weather, and have made a little money; but there's not enough yet for what we require, and we must work away for some time still, before we get as much as will replenish our empty byre.'

'I will do all I can to help you, father,' replied the boy. 'I saw a track on the Wellhorn yesterday that promises a finer buck than we have taken yet.'

'On the Wellhorn! On which side?'

'On the glacier side, father. It is not so very difficult to get up there; but I noticed that whenever he was disturbed, the chamois went across the glacier towards the Engelhorn, and I'm afraid it would be rather dangerous to follow him. There are cracks in the ice hundreds of feet deep, and how well we know that whoever falls into one of them would never see the light of day again!'

'That is very true,' said his father thoughtfully. 'But we must have the buck at any risk. Do you know the spot on the glacier where he makes for the Engelhorn?'

'Yes; it is quite at the top, where the ice is spread out like a sea.'

'Well then,' said the experienced mountaineer, 'we must try and avoid following the chamois over the ice, and rather wait for him on the Engelhorn, and get a shot at him as he passes. You must go to the Wellhorn, my boy, and drive him towards me.'

'Yes; that will be the best, father,' replied Walter. 'I thought of that myself.'

'Well then, let it be so. We must be off before daybreak to-morrow morning.'

Toni made the necessary preparations the same evening; and long before the first beams of Sol were visible on the following morning, he left the cottage with his son. After a toilsome ascent of half an hour, they separated. The father turned to the left towards the steep and craggy Engelhorn, after he had described the exact point towards which Walter was to drive the animal; while the boy scrambled up the dangerous ridges of the Wellhorn, to find the chamois, and drive it to the place where his father was to lie in wait.

'Be very careful, Watty,' said his father to him ere they parted; 'don't be reckless or fool-hardy.'

The boy promised to be watchful, and they separated, each to his own share of the toilsome and perilous undertaking. Taking advantage of the rocks and stones which marked the path of a former glacier, Walter reached the summit of the Wellhorn without much difficulty, after an hour and a half's climb. Taking a small telescope from his pocket, he peered anxiously across the field of ice which separated him from the Engelhorn, and descried his father working his way cautiously along the edge of the glacier till he gained a part of the rocks that seemed to afford a possibility of climbing. He then had the satisfaction of seeing him sit down to rest.

'He has got just to the right spot,' said he to himself. 'He must have seen the track. It is just fifty feet from there that the chamois springs across a crack in the ice to get to the pasture higher up; and when he once gets sight of him, father won't let him escape. But first and foremost, I must find the game, and start it across.'

No sooner said than done. Clambering from rock to rock, always observant and watchful, the resolute youth pursued his way. Suddenly, however, he stood still, and threw himself flat on the ground.

'I thought so—there he is!' said he to himself. 'I must work my way carefully round to the right, and then frighten him off with a shout.'

Taking stealthy advantage of every rock that could screen him from observation, Walter raised his head now and then to make sure that the chamois had not taken fright and moved from the spot. When he had thus reached the right position, he started to his feet and uttered a loud hullo!

The animal was only about two hundred paces distant. It heard the shout, and saw the figure of the boy suddenly appear, and with a bound sprang down to the field of ice, which it crossed with light and rapid strides.

'The game is ours!' exclaimed Walter with delight. But his joy was premature. Whether the chamois scented the danger that lay in wait for it on the further side, or whether the creature saw that there was nothing to fear from a boy who was without a gun, it suddenly stopped, turned round and stamped impatiently two or three times on the ice, gazing at Walter the while. Descending the rocks carefully, Walter crossed the ice, and was allowed by the animal to approach within a hundred steps, when with a short shrill whistle it turned round, sprang two or three hundred yards farther on, and stood still as before, and again gazed back at its pursuer.

The courageous boy did not stop in his pursuit. 'I shall go on as far as it will be safe,' thought he, 'and at the worst I can easily turn back.'

The pursuit was accordingly renewed, and lasted in this way nearly an hour. If the lad could only keep the animal from turning off to the right or left, it would be sure to come at last within gunshot of his father.

The chamois, followed by its pursuer, was approaching nearer and nearer the small patch of grass which it was accustomed to visit, and was already within fifty yards of it, when the animal suddenly stopped, gave a tremendous spring to the right, fled across the glacier with the speed of an arrow, and was out of sight in an instant.

'He must have seen father, or else scented him,' said Walter to himself. 'Our trouble is all in vain for to-day, so I must go acquaint father with the result.'

A few minutes brought the lad to where his father was awaiting the appearance of the buck; but Walter saw at once that the older sportsman was aware of what had happened. His father beckoned to him to be silent, and pointed to a small green spot above the steep sides of the Engelhorn. Turning his eyes in that direction, Walter recognised the chamois standing on the scrap of meadow.

'Now we've got him,' whispered his father. 'I saw you driving him along this way, and started him up there on purpose. I have watched the spot carefully, and as the buck has been in the habit of feeding there, I felt sure he would make for it as soon as he saw me. But we've got him now. He can't take the steep sides of the mountain, and we've cut off his retreat; so come along, my boy, as fast as you can.'

Following his father hurriedly over the ice, they soon reached a point from which they could get a good view of the chamois. Unfortunately, however, a large chasm in the ice lay right before them, and stopped their progress. The chamois had cleared it; but it was quite beyond human strength and agility.

'We can't get across here, father,' said Walter in a whisper; 'let us try and find some other way.'

'We can't find a better spot than this,' replied his father, examining his gun.

'But what's the use of shooting him? What's the good of a dead chamois if we can't get him?'

'When he's once dead, boy, we'll soon find some means of getting at him,' was the answer. 'A board laid over the crevasse will be an easy way of recovering the venison.'

'But we haven't got a board, father.'

'That we'll see about. Just stand on one side, Watty!'

The hunter cocked his gun, took aim for a moment, and was going to fire, when he turned suddenly pale and dropped his arm.

'What's the matter, father? Do you feel ill?' inquired Walter with anxiety.

'No,' replied the huntsman; 'but it seemed as if the ice was giving way just as I was going to fire. But it can't be,' he continued, stamping his foot; 'the ice is solid and firm enough.'

'Let us go home, father,' implored Walter. 'I feel a presentiment that something will happen. Come home now, and we can try for the buck to-morrow.'

But the old mountaineer had in the meantime become self-possessed again, and again raised his gun to fire. Just as he pulled the trigger, however, his foot slipped; and with an exclamation of horror, Walter saw him carried rapidly towards the rift in the ice and suddenly disappear. With the recoil of the gun the hunter had lost his balance on the slippery ice, and at the same moment that his shot struck the chamois, he was hurled into the 'rift.'

'Father! father! father!' screamed Walter, throwing himself on the ice, horror-stricken, and peering wildly down the crevasse. 'Father, speak!'

All was silent. Only a slight trickling, as if from some subterranean stream, reached his ear.

For several minutes the youth lay at the edge of the chasm paralysed with terror. When he recovered his consciousness, a feeling of alarm and distress overwhelmed him. He wept and wrung his hands bitterly.

'Father!' he cried again into the abyss that yawned beneath him—'Father, speak to me, for God's sake!'

A sudden thrill passed through his frame as a low murmur came up from the icy grave. He strained his ears to listen to the broken words. 'I am alive, Watty,' was the reply of the unfortunate man; 'but my ankle is out of joint, and one of my arms broken. I shall never see the light of day again.'

A cry of mingled joy and agony burst from Walter's lips.

'Don't be afraid, father,' he exclaimed. 'You shall be rescued, with God's help! Have you got your bag with you?'

'Yes; but my bottle is broken.'

'Well, then, take mine. I'll lower it down with a cord.—Have you got it?'

'Yes' was feebly answered. 'I can hold out now for a while, unless the cold strike me.'

'Courage, father, till I run down to the village, and get the neighbours and shepherds to come with ropes and poles. Try to hold out for a couple of hours, and with the help of God, you shall be saved.'

'Ay, ay, dear boy,' was the faint reply; 'I will try to be patient till you come back;' and with a God-speed, Walter hurried off to rouse the neighbours to the rescue.

It was a dangerous journey that the brave boy undertook for his father's rescue; but courage, and the agility which is acquired by those who are accustomed to the mountains from childhood, enabled him to reach the valley in a wonderfully short time. Pale as death, with hands bleeding, and clothes torn to shreds, he rushed to the inn, which was the nearest spot where help could be found. His appearance naturally created consternation; and in answer to the numerous questions addressed to him, he related in a few breathless words the dreadful accident which had befallen his father. A score of stalwart hands were instantly ready to rescue the unfortunate man from his dreadful position; the landlord of the inn ordered ropes, poles, and ladders to be got in readiness, and meanwhile pressed refreshment on the well-nigh exhausted youth. Moments were precious; but ere long the party reached the scene of the disaster, when Walter, leaning over the edge of the cleft, cried to his father, and was answered.

'Yes, I'm still alive!' replied the mountaineer, in weakly tones; 'but I am almost frozen to death, and in dreadful pain. Make haste and help me, if you can, for I'm losing my senses.'

'Down with the rope!' shouted the landlord, who had himself come with the party.—'Look out, Hirzel! Place the loop over your shoulders and under your arms, and try to draw it tight. There are plenty of strong arms here that will soon get you up.'

The rope having been made fast to an iron stanchion driven into the ice, the looped end was lowered away into the chasm; but no sign was made by Hirzel that he had obeyed the directions, and fastened it round his body.

'Father, why don't you make haste?' exclaimed Walter in agony.

But there was no answer.

'He must have fainted at the last moment,' said the landlord; 'and if so, then may God have mercy upon him, for not a living creature could venture such a depth!'

'I will venture it!' exclaimed Walter, seizing the rope. But twenty hands held him back. 'Let me go!' he cried. 'I must save my father!' and breaking loose with a sudden effort from the men who surrounded him, the courageous youth seized the rope and disappeared in sight of his horror-stricken companions.

A few terrible moments passed, when a shout from below was suddenly heard, and the cry 'All right, pull away, friends!' sent a thrill of joy through every heart.

'Pull steadily, my men,' cried the good landlord; 'but pull as if your own lives depended on it.—I can see them now!' exclaimed he, gazing

into the gloomy abyss. 'Hirzel seems to have fainted, just as I thought, but Watty has fastened the rope round him securely. Pull away; they will be at the top in a few seconds!'

Encouraged by success, the men redoubled their efforts, and had soon the satisfaction of landing father and son safely on the ice.

A rough kind of stretcher having been hastily made of poles and ropes, the wounded hunter was laid upon it and carried home; and as there was no lack of stout hearts and sure feet, the journey was accomplished without accident. After setting his broken limbs and binding up his wounds, the doctor, who had been speedily called in, expressed the hope that Hirzel's life would be saved, but he doubted very much if he would ever be able to climb the mountains for chamois again. Walter was thankful to find that his father's life was in no danger; and had himself so far recovered his equanimity as to be able to relate how he had rescued him from his icy grave, and how he found that the rope, instead of having reached the wounded man, had actually rested on a ledge ten feet above the place where he lay. Walter, who felt devoutly thankful that his efforts had been so successful, was overwhelmed with praises for his heroism.

Nor was the chamois forgotten. The generous landlord had it brought down to the inn from the spot where it had fallen, and sent an ample equivalent to Hirzel's cottage.

RUBBISH.

Most of the substance we call the rubbish of our houses finds its way sooner or later into the dust-bin, and thence into the dustman's cart, which conveys it to the dust-contractor's yard; and there we are for the most part contented to lose sight of it. It is worthless to us, and we are thankful to be rid of it, and think no more of it. But no sooner does it reach its destination in the yard, than our rubbish becomes a valuable commodity. The largest cinders are bought by laundresses and braziers, the smaller by brick-makers. The broken crockery is matched and mended by the poor women who sort the heaps, that which is quite past repair being sold with the oyster-shells to make roads; and the very cats are skinned, before their dead bodies are sent away with other animal and vegetable refuse to be used as manure for fertilising our fields. Nothing is useless or worthless in the contractor's eyes; for rubbish, like dirt, is simply 'matter out of place.'

The term is an entirely correlative one; what is rubbish to one person under certain circumstances, being under altered conditions extremely valuable to another. Gold itself is rubbish in the eyes of a man who is starving on a desert island; and the pearls which adorn a royal diadem and have made the fortune of the lucky finder, were probably felt to be worse than useless by the poor oyster, tormented by the presence of some particle of matter which he felt to be decidedly 'out of place' within his shell. Many a cook no doubt had washed the little fresh-water

bleak, a fish about four inches long, and had thoughtlessly poured away the water after the operation, before it occurred to the French bead-maker that the lustrous silvery sediment deposited at the bottom of the vessel might be turned to account in the manufacture of artificial pearls, or pearl-beads.

It is indeed strange to consider how many of our most highly prized adornments and our most useful and important manufactures are derived from our own and Nature's refuse. The jet which brings in some twenty thousand pounds a year to the town of Whitby alone, is merely a compact, highly lustrous, and deep black variety of lignite, a species of coal less ancient in origin than that of the Carboniferous era which we usually burn. And coal itself, as we know, is merely the refuse of ancient forests and jungles, peat-mosses and cypress swamps, which has been mineralised in the course of ages and stored for our use in the bowels of the earth. Amber too, which is also used for ornaments, especially in the East, is but the fossil gum or resin of the *Pinites succinifer*, large forests of which seem to have existed in the north-east portion of what is now the bed of the Baltic. To the pine-tree this gum was certainly nothing but refuse, a something to be got rid of; but Nature, who rejects nothing however vile and contemptible, received it into her lumber-room, her universal storehouse, and after keeping it patiently much more than the traditional seven years, sends it out again, transformed and yet the same, to adorn the Eastern beauty, and to give employment to many a skilful pair of hands. Bogwood, which like jet, is used for bracelets, brooches, &c. is merely oak or other hard wood which has lain for years in peat-bogs or marshes, and has acquired its dark colouring from the action of oxidised metal upon the tannin it contained.

Turning, however, from Nature's processes to those of man, we find that he is doing his best, however clumsily, to follow the thrifty example she sets him. For many and many a year no doubt the pine-tree shed its pointed, needle-like leaves in the Silesian forests, and there they were left to decay and turn into mould at their leisure, until M. Pannewitz started a manufactory for converting them into forest-wool, which, besides being efficacious in cases of rheumatism when applied in its woolly state, can also be curled, felted, or woven. Mixed with cotton, it has even been used for blankets and wearing apparel. The ethereal oil evolved during the preparation of the wool is a useful medical agent, besides being serviceable as lamp-oil and also as a solvent of caoutchouc; and even the refuse left when the leaves have yielded up their oil and wood, is not looked upon as rubbish, but is compressed into blocks and used for firewood; while the resinous matter it contains produces gas enough for the illumination of the factory.

Truly, as one man's meat is another man's poison, so one man's rubbish is another man's treasure. While the Russians export or simply waste all their bones, other more thrifty people boil them, to extract their grease and gelatine; convert them into charcoal, to be used in refining

sugar; pass them on to the turner, to be made into knife-handles and a thousand other useful articles; or grind them up to supply phosphate of lime for the farmer's crops. The commonest and roughest kinds of old glass are now bought up by a certain manufacturer, who melts them up, colours the liquid by a secret process of his own invention, to any tint he desires, and finally pours it out to cool in flat cakes. These are broken by the hammer into fragments of various size and shape, which are used to produce most effective decorations, such as might be introduced with advantage in many a now plain unattractive-looking building. The cost of this variety of mosaic is less than that of any other, and no doubt it will be extensively used as it becomes better known.

Even such insignificant things as cobwebs are turned to account, not merely for healing cut fingers—Bottom's sole idea as to their use—but for supplying the astronomer with cross-lines for his telescopes. Spiders' threads have even been woven, though one cannot imagine where or how, except in fairyland, by fairy fingers, and for fairy garments; and among the curiosities which travellers bring home from the Tyrol are pictures painted upon cobwebs, the drawing of which is perfectly clear and distinct, with the spider's handiwork at the same time plainly apparent. High prices are charged for these strange works of art, and no wonder, for the cobweb paper—which resembles a fluffy semi-transparent gauze—looks as if it must be extremely unpleasant to draw upon; and no doubt the eccentric artist fails many times before he succeeds in producing a saleable article. But we may descend even lower than cobwebs in the scale of refuse, and still find that we have not reached the dead-level at which things become utterly worthless and good for nothing. Nay, much that is sweetest and associated in our minds with luxury and refinement, may now be produced from that which is in itself most repulsive. For, while artificial vanilla can be made from the sap of the pine-tree, essence of almonds from benzine, and the delicate perfumes of woodruff and melilot from coal-tar, other scents as fragrant can be obtained from the unsavoury refuse of the stable.

Perhaps there is nothing more interesting and instructive, as shewing how the meaning of the word 'rubbish' varies, than the history of gas-making. To begin with: the coal which yields most gas is what is termed 'cannel' coal, and is now worth from twenty-five to thirty shillings a ton or more; whereas fifty years ago, before the introduction of gas, it was looked upon as almost worthless. In distilling coal for gas, a liquor is produced which for a long time was so great an inconvenience to the gas companies that they actually paid for permission to drain it into the common sewers, as the simplest way of getting rid of it. This gas-liquor contains salts of ammonia, together with naphtha and tar; and the tar is now made by repeated distillation to yield pitch, benzole, creosote, carbolic acid, the substance known as paraffine, and aniline. It seems strange now that these valuable products should ever have been thrown away as useless; still stranger is it to learn that we derive from one of these waste substances the whole series of beautiful colours called aniline dyes. Naphthaline

is another residuary product, by a novel application of which it is said that the light-giving properties of gas may be enhanced fourfold, at a very trifling cost. But the uses to which the waste liquor of the gas-works may be put are not yet exhausted; for not only is it turned to account itself, but combined with the slaty shales found among the coal, which were also at one time a source of perpetual annoyance, it yields alum—used in the manufacture of paper and preparation of leather; copperas or green vitriol (sulphate of iron), used in dyeing, tanning, and the manufacture of ink and Prussian blue; and sulphuric acid.

Rags are now recognised as such a valuable commodity that in some countries their export is forbidden by government; nevertheless, from one source or another the paper-makers of England alone import annually some eighteen or twenty thousand tons of linen and cotton rags, and collect large quantities at home. These rags are of very varying degrees of cleanliness, as may be imagined; some of the English ones require no bleaching at all, while those of Italy bear away the palm for dirt. Old sails are made into the paper used for bank-notes, so it is said, and old ropes reappear as brown paper; but many other things besides flax, hemp, and cotton are now used in the manufacture, and paper is made and remade over and over again. Not a scrap of paper need be wasted, for there are plenty of persons ready to buy it; and if not good enough for remanufacture as paper, it can always be converted into papier-mâché, no matter what its colour or quality. Cuttings of paper severed by bookbinders, pasteboard-makers, envelope-cutters, pocket-book-makers, and paper-hangers are readily bought up; and so too are tons-weight of old ledgers and account-books by the papier-mâché manufacturer, together with old letters and any other paper-rubbish, giving a pledge that all shall be promptly consigned to destruction in his large vat; and out of this heterogeneous assemblage he produces a substance so hard and firm and durable that it has been suggested as suitable for making soldiers' huts and even ships. It is already put to a variety of uses, and is employed for ceiling ornaments, cornices, frames, mill-board, bulk-heads, cabin-partitions, piano-cases, chairs, tables, &c. One complete suite of papier-mâché furniture inlaid with mother-of-pearl was made a few years ago for the Queen of Spain. Woollen rags are always saleable for the purpose of being ground to powder, coloured, and used for flock-papers and artificial flowers; while they may be re-manufactured, no matter how old they may be, and with a certain admixture of new wool, converted into a coarse kind of cloth largely exported to South America.

We might go on in this way almost *ad infinitum*, shewing how one waste substance after another has been taken up and made into an important factor in the social economy; but enough has been said to prove that it is not so easy as it might seem at first sight to say with any certainty what is rubbish. Of this we may be sure—the wiser men grow and the more they learn of Nature's secrets, the less they will throw away as useless. After all, Nature is the great alchemist; and though necessity is sharpening our wits and making us very clever at turning to account many a thing which our forefathers contentedly threw

away, still our best efforts look clumsy by the side of hers, and our dust-yards and lumber-rooms are but repulsive, untidy receptacles compared with her wonderful laboratory.

ANECDOTES OF AUTHORS.

There is always an additional interest attaching to a book when we know something of its author or of the circumstances under which it was written. The knowledge that Milton was blind when he conceived the splendid imagery of *Paradise Lost*, adds one more wonder to that marvellous production; and have we not from childhood pictured to ourselves John Bunyan in his prison-cell writing about the 'Slough of Despond' and the 'Shining Ones' in the *Pilgrim's Progress*? A number of incidents connected with the writing of well-known books, and other facts and amusing stories about authors, have been brought together by the same pen which wrote *Anecdotes of Artists*. A few of these we append.

Those who have laughed over the exploits of John Gilpin—and who has not?—will read with interest the following account of its origin. 'It happened one afternoon, in those years when Cowper's accomplished friend Lady Austen made a part of his little evening circle, that she observed him sinking into increased dejection. It was her custom on these occasions to try all the resources of her sprightly powers for his immediate relief. She told him the story of John Gilpin—which had been treasured in her memory from her childhood—to dissipate the gloom of the passing hour. Its effect on the fancy of Cowper had the air of enchantment. He informed her the next morning that ebullitions of laughter, brought on by his recollection of her story, had kept him waking during the greatest part of the night, and that he had turned it into a ballad.' To Lady Austen's suggestion also we are indebted for Cowper's poem of *The Task*.

Johnson, the publisher in St Paul's Church-yard, obtained the copyright of Cowper's poems—which proved a great source of profit to him—in the following manner. One evening a relation of Cowper's called upon Johnson with a portion of the manuscript poems, which he offered for publication, provided Johnson would publish them at his own risk, and allow the author to have a few copies to give to his friends. Johnson read the poems, approved of them, and accordingly published them. Soon after they had appeared, there was scarcely a reviewer who did not load them with the most scurrilous abuse, and condemn them to the butter-shops; and the public taste being thus foolishly misled, these charming effusions stood in the corner of the publisher's shop for a long time as an unsaleable pile. At length Cowper's relation called upon Johnson with another bundle of the poet's manuscript, which was offered and accepted upon the same terms as before. In this fresh collection was the poem of *The Task*. Not alarmed at the fate of the former publication, but thoroughly assured of the great merit of the poems, they were published. The tone of the reviewers became changed, and Cowper was hailed as the first poet of the age. The success of this second publication set the first in motion. Johnson soon reaped the fruits of his undaunted judgment, and Cowper's poems enriched the publisher when

the poet was in languishing circumstances. In October 1812, the copyright of Cowper's poems was put up for sale among the London booksellers in thirty-two shares. Twenty of the shares were sold at two hundred and twelve pounds each. The work, consisting of two octavo volumes, was satisfactorily proved at the sale to net eight hundred and thirty-four pounds per annum. It had only two years of copyright; yet this same copyright produced the sum of six thousand seven hundred and sixty-four pounds.'

Coleridge, among his many speculations, started a periodical in prose and verse entitled *The Watchman*, with the motto, 'That all might know the truth, and that the truth might make us free.' He watched in vain! Coleridge's incurable want of order and punctuality, and his philosophical theories, tired out and disgusted his readers, and the work was discontinued after the ninth number. Of the unsaleable nature of this publication, he relates an amusing illustration. Happening one morning to rise at an earlier hour than usual, he observed his servant-girl putting an extravagant quantity of paper into the grate in order to light the fire, and he mildly checked her for her wastefulness. 'La! sir,' replied Nanny, 'why, it's only *Watchmen*!'

'Stammering,' says Coleridge, 'is sometimes the cause of a pun. Some one was mentioning in Lamb's presence the cold-heartedness of the Duke of Cumberland in restraining the Duchess from rushing up to the embrace of her son, whom she had not seen for a considerable time, and insisting on her receiving him in state. "How horribly cold it was," said the narrator. "Yes," said Lamb, in his stuttering way; "but you know he is the Duke of Cu-cum-ber-land."'

Cottle in his *Life of Coleridge* relates the following amusing incident: 'I led the horse to the stable, when a fresh perplexity arose. I removed the harness without difficulty; but after many strenuous efforts, I could not remove the collar. In despair I called for assistance, when aid soon drew near. Mr Wordsworth brought his ingenuity into exercise; but after several unsuccessful attempts, he relinquished the achievement as a thing altogether impracticable. Mr Coleridge now tried *his* hand, but shewed no more grooming skill than his predecessors; for after twisting the poor horse's neck almost to strangulation, and the great danger of his eyes, he gave up the task, pronouncing that the horse's head must have grown (gout or dropsy!) since the collar was put on; for, he said, "it was a downright impossibility for such a huge *os frontis* to pass through so narrow a collar." Just at this instant a servant-girl came near, and understanding the cause of our consternation: "La! master," said she, "you don't go about the work in the right way; you should do like this;" when turning the collar completely upside down, she slipped it off in a moment, to our great humiliation and wonderment, each satisfied afresh that there were heights of knowledge in the world to which we had not yet attained.'

We are told of Fielding's *Tom Jones*, that when the work was completed, the author 'being at the time hard pressed for money, took it to a second-rate publisher, with the view of selling it for what it would fetch at the moment. He left it with the bookseller, and called upon

him next day for his decision. The publisher hesitated, and requested another day for consideration; and at parting, Fielding offered him the manuscript for twenty-five pounds. On his way home, Fielding met Thomson the poet, whom he told of the negotiation for the sale of the manuscript; when Thomson, knowing the high merit of the work, conjured him to be off the bargain, and offered to find a better purchaser. Next morning, Fielding hastened to his appointment with as much apprehension, lest the bookseller should keep to his bargain, as he had felt the day before lest he should altogether decline it. To the author's great joy, the ignorant trafficker in literature declined, and returned the manuscript to Fielding. He next set off with a light heart to his friend Thomson; and the novelist and the poet then went to Andrew Millar, the great publisher of the day. Millar, as was his practice with works of light reading, handed the manuscript to his wife, who having read it, advised him by no means to let it slip through his fingers. Millar now invited the two friends to meet him at a coffee-house in the Strand, where, after dinner, the bookseller, with great caution, offered Fielding two hundred pounds for the manuscript. The novelist was amazed at the largeness of the offer. "Then, my good sir," said he, recovering himself from this unexpected stroke of good fortune, "give me your hand—the book is yours.—And waiter," continued he, "bring a couple of bottles of your best port." Before Millar died, he had cleared eighteen thousand pounds by *Tom Jones*, out of which he generously made Fielding various presents, to the amount of two thousand pounds; and when he died, he bequeathed a handsome legacy to each of Fielding's sons.

There are some amusing stories told of the two Sheridans, father and son. Sheridan—probably with a view to improving the financial condition of the family—was very desirous that his son Tom should marry a young lady of large fortune; but he knew that a Miss Callander had already won his heart. The father expatiating on the folly of his son, at length broke out: "Tom, if you marry Caroline Callander, I'll cut you off with a shilling!"

Tom looking maliciously at his father, said: "Then sir, you must borrow it!"

In a large party one evening, the conversation turned upon young men's allowances at college. Tom deplored the ill-judging parsimony of many parents in that respect.

"I am sure Tom," said his father, "you have no reason to complain; I always allowed you eight hundred pounds a year."

"Yes, father, I confess you allowed it; but then, it was never paid!"

Hannah More and her sister visited London in 1773 or 1774, and were the guests of Garrick. They were received with favour by Johnson, Reynolds, and Burke. Hannah More's sister has thus described their first interview with Johnson: "We have paid another visit to Miss Reynolds; she had sent to engage Dr Percy—*Percy's Collection*, now you know him—quite a sprightly modern, instead of a rusty antique, as I expected. He was no sooner gone, than the most amiable and obliging of women, Miss Reynolds, ordered the coach to take us to Dr Johnson's very own house. Yes, *Abyssinian Johnson! Dictionary*

Johnson! Ramblers, Idlers, and Irene Johnson! Can you picture to yourselves the palpitation of our hearts as we approached his mansion? The conversation turned upon a new work of his just going to the press, the *Tour to the Hebrides*, and his old friend Richardson. Mrs Williams, the blind poetess, who lives with him, was introduced to us. She is engaging in her manners, her conversation lively and entertaining. Miss Reynolds told the Doctor of all our rapturous exclamations on the road. He shook his scientific head at Hannah, and said she was "a silly thing." When our visit was ended, he called for his hat, as it rained, to attend us down a very long entry to our coach; and not Rasselas could have acquitted himself more *en cavalier*."

"Dr Johnson's wigs were in general very shabby, and their fore-parts were burned away by the near approach to the candle which his short-sightedness rendered necessary in reading. At Streatham, Mr Thrale's butler always had a wig ready; and as Johnson passed from the drawing-room, when dinner was announced, the servant would remove the ordinary wig, and replace it with the newer one; and this ludicrous ceremony was performed every day."

Everybody has heard of the ready wit of Douglas Jerrold: the following are a few specimens. "At a club of which Jerrold was a member, a fierce Jacobite, and a friend as fierce of the Orange cause, were arguing noisily, and disturbing less excitable conversationalists. At length the Jacobite, a brawny Scot, brought his fist down heavily upon the table, and roared at his adversary: "I tell you what it is sir—I spit upon your King William!"

"The friend of the Prince of Orange rose, and roared back to the Jacobite: "And I sir, spit upon your James II.!"

"Jerrold, who had been listening to the uproar in silence, hereupon rang the bell, and shouted: "Waiter, spittoons for two!"

"At an evening party, Jerrold was looking at the dancers, when seeing a very tall gentleman waltzing with a remarkably short lady, he said to a friend near: "Humph! there's the mile dancing with the milestone!"

"Jerrold and some friends were dining once at a tavern, and had a private room; but after dinner, the landlord, on the plea that the house was partly under repair, requested permission that a stranger might take a chop in the apartment at a separate table. The company gave the required permission; and the stranger, a man of commonplace aspect, was brought in, ate his chop in silence, and then fell asleep, snoring so loudly and discordantly that the conversation could with difficulty be carried on. A gentleman of the party made a noise; and the stranger, starting out of his nap, called out to Jerrold: "I know you, Mr Jerrold—I know you; but you shall not make a butt of me!"

"Then don't bring your hog's head in here," was the instant answer of the wit."

The following is a story of Sir Walter Scott's: "The chemical philosophers Dr Black and Dr Hutton were particular friends, though there was something extremely opposite in their external appearance and manner. Dr Black spoke with the English pronunciation, and with punctilious accuracy of expression. The geologist Dr Hutton was the very reverse of this; his conversation was conducted in broad phrases, expressed with a

strong Scotch accent, which often heightened the humour of what he said. It chanced that the two doctors had held some discourse together upon the folly of abstaining from feeding on the testaceous creatures of the land, while those of the sea were considered as delicacies. Wherefore not eat snails? They are known to be nutritious and wholesome, and even sanative in some cases. The epicures of old praised them among the richest delicacies, and the Italians still esteem them. In short it was determined that a gastronomic experiment should be made at the expense of the snails. The snails were procured, fattened for a time, and then stewed for the benefit of the two philosophers only, who had either invited no guests to their banquet, or found none who relished in prospect the *pièce de résistance*. A huge dish of snails was placed before them. Philosophers are but men after all; and the stomachs of both doctors began to revolt against the experiment. Nevertheless, though they looked with disgust on the snails, they retained their awe of each other, so that each conceiving the sensations of internal revolt peculiar to himself, began, with infinite exertion, to swallow in very small quantities the mess which he internally loathed. Dr Black at length shewed the white-feather, but in a very delicate manner, as if to sound the opinion of his mess-mate. "Doctor," he said in his precise and quiet manner—"doctor, do you not think that they taste a little—a very little green?" "Green!" vociferated Dr Hutton with a prefix we prefer to omit. "Green indeed! Tak' them awa, tak' them awa!" And starting up from the table, the doctor gave full vent to his feelings of abhorrence. So ended all hopes of introducing snails into the modern *cuisine*, and thus was shewn the fact that philosophy can no more cure nausea than honour can set a broken limb.

The following characteristic story of two 'intellectual gladiators' is related in *A New Spirit of the Age*: 'Leigh Hunt and Carlyle were once present amongst a small party of equally well-known men. It chanced that the conversation rested with these two, both first-rate talkers, and the others sat well pleased to listen. Leigh Hunt had said something about the Islands of the Blest, or El Dorado, or the Millennium, and was flowing on in his bright and hopeful way, when Carlyle dropped some heavy tree-trunk across Hunt's pleasant stream, and banked it up with philosophical doubts and objections at every interval of the speaker's joyous progress. But the irrepressible Hunt never ceased his overflowing anticipations, nor the saturnine Carlyle his infinite demurs to those finite flourishings. The listeners laughed and applauded by turns, and pitted them against each other, as the philosopher of Hopefulness and of the Unhopeful. The contest continued with all that ready wit, that mixture of pleasantry and profundity, that extensive knowledge of books and character, with their ready application in argument or illustration, and that perfect ease and good-nature which distinguish each of these men. The opponents were so well matched that it was quite clear the contest would never come to an end by victory on either side. But the night was far advanced, and the party broke up. They all sallied forth; and leaving the close room, the candles, and the arguments behind them, suddenly found themselves in presence of

a most brilliant starlight night. They all looked up. "Now," thought Hunt, "Carlyle is done for; he can have no answer to that.—There!" he shouted. "Look up there! Look at that glorious harmony, which sings with infinite voices an eternal song of hope in the soul of man."

'Carlyle looked up. The whole party remained silent, to hear what he would say.. They began to think he was silenced at last—he was but mortal. But out of that silence came a few low-toned words in a broad Scotch accent. And who on earth could have anticipated what the voice said? "Eh! it's a *sad* sight."

'Hunt sat down on a door-step. They all laughed, then looked very thoughtful, then laughed again. Finally they bade each other "good-night," and betook themselves homeward with slow and serious pace. There might be some reason for sadness too. That brilliant firmament probably—we would rather say possibly—contained infinite worlds, each full of struggling and suffering beings—for beings who had to die—for life in the stars may imply that those bright worlds may also be full of graves; all that life, like ours—our philosophers appear to have ignored Revelation in these thoughts—knowing not whence it came nor whither it goeth, and the brilliant universe in its great movement having perhaps no more certain knowledge of itself nor of its ultimate destination than hath one of the suffering specks that compose this small spot we inherit.'

We must confess to a preference for Leigh Hunt's spirit; and with a few words of his on 'Literary Localities,' we conclude. He pleasantly says: 'I can no more pass through Westminster without thinking of Milton; or the Borough without thinking of Chaucer and Shakspeare; or Gray's Inn without calling Bacon to mind; or Bloomsbury Square without Steele and Akenside, than I can prefer brick and mortar to wit and poetry, or not see a beauty upon it beyond architecture, in the splendour of the recollection. I once had duties to perform which kept me out late at night, and severely taxed my health and spirits. My path lay through a neighbourhood in which Dryden had lived; and though nothing could be more commonplace, and I used to be tired to the heart and soul of me, I never hesitated to go a little out of the way, purely that I might pass through Gerard Street, and so give myself the shadow of a pleasant thought.'

HER FATHER'S DAUGHTER.

CHAPTER III.

WITHIN little more than a month after his wife's interview with Sir Charles Stopford, Gerald Rivers was duly installed as station-master at Leaswood. Alice arrived a couple of days later by the evening train, bringing with her as general servant a girl of eighteen, whom she had hired in London, and who knew nothing whatever of the antecedents either of her or her husband. In days gone by, Alice had been well known by sight at Leaswood Station, and to nearly every person in the neighbourhood for miles around, so that she was obliged to be very careful now in order to avoid recognition. When she went out in the daytime, which was not very often, she wore a veil so thick that even her own sisters would have passed her unknowing who was behind it;

while on those occasions when she took an after-dusk ramble with her husband, a veil of a thinner texture effectually shielded her from observation.

Gerald had been about a fortnight at his new duties when Mr Crewdson, his wife's father, one day alighted from the train. He was a stout white-haired gentleman, who claimed the help of a thick cane when he walked, and whom his last attack of gout had left slightly lame. By the porters at the station, the flymen and others, he was known as 'Old Pepper-corn' or 'Old Fire-away.' Some of the heat of his temper would seem to have imparted itself to his complexion, which was not unlike a boiled lobster in tint.

'So you are the new station-master, eh?' he said, with a sort of disdainful grunt, as he surveyed Gerald from head to foot.

'I am that person, at your service sir.'

'Humph! I was quite satisfied with the man who was here before, and it was a tom-fool's trick to send him away. I don't suppose I shall be half as well satisfied with you.'

'You have not given me a trial yet sir.'

'Oh, we shall soon put you to the proof. I hope you are a good hand at telegraphing.'

'Had I not been so, I should hardly have been here.'

'That's no answer. But let me tell you, young man, that your time here will be a very short one unless you attend properly to my telegrams.'

'I shall give them every attention.'

'You had better do so. Some of them are in cipher, and with those you cannot be too particular. An error of even a single letter might be of serious consequence to me. At whatever hour a message for me may arrive, you will lose no time in sending it up to my house by special messenger. If you attend to me properly, there will be a turkey for you at Christmas; but if you don't, why then, the sooner you look out for another job the better.'

'It's only papa's grumpy way,' said Alice to Gerald, when told of the interview. 'He's very obstinate, and will have his own way; but at heart he's as good as gold, as you will one day discover for yourself.'

Next morning Alice went up to London by the early train, and drove at once to Sir Charles Stopford's. It was just eleven o'clock, and he was still lounging over his breakfast. He welcomed his god-daughter warmly, and ordered up some fresh chocolate.

'God-pa,' said Alice at last, when she had told him all the news, 'is your broker—your man who buys and sells for you in the City—the same man that is employed by papa?'

'No. Boucher is my man. Your father's man is Simmonds—a fellow that I don't like at all.'

'Then perhaps you won't mind giving me a note to your Mr Boucher?'

'Why now! A note indeed! What kind of a note?'

'A simple note of introduction, stating that the bearer is Mr Crewdson's daughter, and that any commission I may ask him to do for me must have the same attention as if it were for yourself.'

Sir Charles gave a long low whistle. 'Why now, you don't mean to say that you are going to speculate on the Stock Exchange?'

'Why should I not do a little in that line as

well as you or papa?' asked Alice with a smile. 'When I used to act as papa's secretary, I learned to take quite an interest in the different kinds of stocks and in the rise and fall of the money market.'

'Ay, ay; that's all very well. But that's very different from buying and selling on your own account. You would be sure to burn your fingers before very long.'

'I should hardly do that, I think, god-papa. In any case, I have not much to lose, so shall not venture into very deep water.'

'Why now, it's just the sort of thing one might expect from your father's daughter. My friend Crewdson made every penny of his fortune on the Stock Exchange, and I suppose there's a sort of mania in it that runs in the family. But if you could only have the benefit of your father's advice, now?'

'That is quite out of the question. Had it not been so, there would have been no occasion for my errand here this morning.'

'Quite true, my pretty logician. Then I suppose I must give you what you ask for.'

'Of course you must. The idea of your refusing your god-daughter such a trifle!'

When Alice had got what she wanted from Sir Charles, she drove at once to Plummer's Court, Cornhill. She was fortunate enough to find Mr Boucher in his office. When he had read the note, he said: 'I need hardly tell you, Miss Crewdson, that my best services will always be at your disposal. I have had many transactions with your father at one time or another.'

'I am married,' said Alice, 'and my name is Mrs Gerald. Any communications I may have to make to you will reach you in the form of telegrams from Leaswood station; but whenever a telegram from me reaches you, it must be acted upon with the utmost promptitude; not an hour must be thrown away.'

'I will give special instructions that any message from you shall be brought to me, wherever I may be, immediately on its arrival, and you may depend upon its having my most prompt attention.'

Day passed after day till several weeks had come and gone, during which time a considerable number of telegrams reached Leaswood Station for Mr Crewdson, each one of which was shewn to Alice by her husband before being sent on by a special messenger to Brookfield. More than one of these telegrams was in cipher, but that fact did not seem to cause Mrs Rivers much difficulty. Before her marriage and during her father's frequent attacks of gout, she had often acted as his secretary, and the keys to the two different kinds of cryptogram made use of by certain of his telegraphic correspondents were thoroughly understood by her.

At length one day there came a message addressed to her father, which, when translated by Alice, caused her cheeks to flame and her eyes to light up with sudden fire, and set her whole frame aglow with intense excitement. Gerald, who had been out to attend to one of his trains while his wife interpreted the message, looked and wondered, but said nothing, waiting quietly for the explanation which he knew a few minutes must bring. The message was headed: 'From Edgar Crewdson, New York, to Edward B. Crewdson, Brookfield, near Leaswood Station, Midlandshire, England.' It had been sent by submarine cable to London

in the first instance, and thence forward to Leaswood. 'It is from my uncle Edgar in America,' said Alice; a fact which Gerald had guessed already. Then she rose suddenly from her seat and flung her arms round her husband's neck and burst into tears. 'At last, my love, at last!' she murmured. 'Surely the sunshine is coming at last.'

'May I read it?' asked Gerald. The answer, with her head still on his shoulder, was a pressure of her arms; so Gerald took up the paper, on which his wife's writing was still wet, and read as follows: 'Buy up all the Deep Lips you can lay hands on. Struck oil once more. This may be relied on. Private information. Wall Street in the dark yet.' Gerald was puzzled, and his face betrayed it.

'You darling old ignoramus!' said his wife between laughing and crying.

'I confess that I can make neither head nor tail of it,' he said.

'And yet it is very, very simple.'

'To clever little wives like you perhaps, but not to stupid husbands like me. Pray, what may be the meaning of Deep Lips?'

'Deep Lips is the name of a silver mine in Colorado, the shares in which can be bought or sold on the London Stock Exchange like any other scrip. These shares have been quoted at a very low figure for the last two years, as it was believed that the mine was all but worked out. The phrase "Struck oil once more" can have but one meaning: that the miners have unexpectedly come across a fresh lode or vein of silver—doubtless a very rich one, judging from my uncle's emphatic request to papa to buy up all the shares he can lay hands on. The words "Wall Street in the dark yet" mean that the news embodied in the telegram is not yet known to the buyers and sellers in New York. The moment it is known to them, a score telegrams will flash across the Atlantic to the same purport as this one. In a case like this an hour will often make all the difference in the world; and if we are only fortunate enough to be first in the field, why then, I think—— But never mind just now what I think. Every moment is precious, and I must telegraph Boucher "slick away."'

Seizing pen, ink, and paper, Alice dashed off the following message: 'From Mrs Gerald, Leaswood, to Mr Boucher, No. 11 Plummer's Court, Cornhill. Buy up in my name all the Deep Lip stock now in the market. Not a moment must be lost. I will be with you at ten to-morrow morning.'

'Not another word till you have despatched my message,' said Alice as she gave the paper into her husband's hands. Like the sensible man he was, Gerald simply nodded and left the room. Five minutes later he was back again.

'Sent it?' asked Alice anxiously.

'Every word. And now perhaps, you will explain still further?'

'Willingly.'

'But first I had better send the message to your father at Brookfield.'

Alice looked at her watch. 'It is now one-thirty,' she said. 'It will take the man an hour to get to Brookfield, and another hour to return, by which time it will be three-thirty. Allowing another half-hour for a telegram from papa to reach Mr Simmonds his broker, that will bring the time to four o'clock—too late in the day for business on the Stock Exchange. Yes, you may send

the message; Boucher will have had a fair start. If he does his duty, there will not be a Deep Lip share to be had for love or money by to-morrow morning.'

'Which means,' said Gerald, 'that you are taking advantage of your knowledge of the information conveyed in your uncle's telegram, to forestall your father's action in the matter, and make the information worthless so far as he is concerned.'

'That is precisely what I am doing,' said Alice with emphasis. 'I was not my father's secretary for so long a time without learning something. He has refused to forgive me or to condone my marriage unless I can go to him with six thousand pounds. He does not ask me whether I am happy. He has no curiosity as to the kind of man I have made my husband. He simply says: "Bring me six thousand pounds, and all shall be forgiven." To meet his mercenary views, I must become mercenary myself. All is fair in love, war, and on the Stock Exchange. The moment the information conveyed in this message reaches my father, he will take advantage of it by telegraphing to his broker to buy up every Deep Lip share in the market. I happen to see the message first, and I take the first advantage of it; that is all.'

'I am afraid that you are making me a confederate in a very nefarious scheme,' said Gerald, looking as if he hardly knew whether to laugh or be serious.

'In this case the end must justify the means. It is just the sort of ruse that papa himself would delight in—just the sort of advantage that he would be the first to take.'

'Then you are buying for what is called a "rise?"' said Gerald.

'Precisely so. If the information conveyed by my uncle's telegram be correct—and he is too old a soldier in the field of speculation not to know what he is about—then will Deep Lips go up, up, up, as soon as the intelligence becomes generally known, and your wife will have made a very lucky hit. Of course my object will be to sell out and realise as soon as the shares have reached what, in Boucher's opinion, seems something like their maximum value.'

'But suppose the information conveyed in your uncle's telegram prove to be incorrect, and the shares don't go up at all—what then?'

'Why, even in that case, they cannot sink much lower than they are at present, and as a consequence, my loss will be proportionately trifling. But I won't even think that loss is possible.'

'Can it be possible that it is my wife who is doing all this?'

'Your wife? Why not, dear? The whole affair is as simple as A B C.'

'But to think of your originating such a scheme!'

'Now you know the reason why I interceded with Sir Charles to have you appointed as station-master at Leaswood.'

'Then the scheme that you are carrying out to-day has been hatching in your brain from the first?'

'Certainly. It came to me like a flash of inspiration on the very day that we received papa's letter.'

'You are a strange girl, and I sometimes think that it will take me my lifetime to read you thoroughly.'

Then Gerald left the room, taking the telegram with him, which he sent off at once by one of his porters to Brookfield. After the departure of the next train he came in for an early cup of tea.

'With regard to this telegram,' said Gerald as he sat down at table, 'it is written in a cipher different from any that I have seen before: it is nothing but a mass of figures.'

'The cipher is a private one, agreed upon between my father and my uncle, and used by them alone. It is of a kind that defies the scrutiny of an outsider, and yet can be read by a child who possesses the key. The key to this kind of cryptogram is a book—a book previously agreed upon by the parties communicating with each other. The book agreed upon in this case, as I happen to know through having been papa's secretary, is a certain edition of Walker's Dictionary, of which I took care to provide myself with a copy before coming to Leaswood. When once the book is known, the rest is as simple as may be. Let us take the first sentence of the telegram, for instance, which, when interpreted, runs as follows: "Buy up all the Deep Lips you can lay hands on." As originally telegraphed it ran thus: "Seven ought dot eleven stroke five nine nine dot one three stroke one seven dot two seven"—and so on, which when put down in actual figures would look thus: 70.11 | 599.13 | 17.27 | 552.7 | 140.14 | &c. I now take my dictionary, and turning to page seventy, count till I come to the eleventh word from the top, which I find to be the word *Buy*. Then turning to page five hundred and ninety-nine, I count down to the thirteenth word from the top, and find it to be the word *up*. Proceeding by the same method, I work gradually through the telegram, with what result you know. Of course everything depended on my knowledge of the book used between my father and uncle. Had I not known that, the telegram would have remained a dead-letter to me for ever.'

CHAPTER IV.

At five minutes past ten next morning, Mrs Gerald, as she called herself, walked into the office of Mr Boucher. 'Did you receive my telegram yesterday afternoon?' were her first anxious words.

'I did, and acted on it immediately.' Then as he handed her a chair: 'I hope you will pardon me for remarking that your choice of an investment is hardly one that would recommend itself to my experience.'

'I suppose not,' said Alice quietly. 'But I had my reasons.'

'Oh, of course,' rejoined Boucher. 'Your father is known as one of our boldest and most successful speculators; and you, as his daughter, would hardly be likely to make any very serious mistake. But still—'

'But still had you been going to lay out money of your own, you would not have done as I have done.'

'Certainly not, unless I had more spare capital than I knew what to do with; and hardly then.'

'There's one comfort—they cannot sink much lower than they are now.'

'But you, I presume, are buying for a rise?'

'Precisely so.'

A significant shrug was the broker's only reply.

'To what extent have you bought for me?'

Boucher named the figure—a large one.

'I should not have thought there was so much in the market.'

'People look on them as a bad lot, and are only too glad to find a customer.'

'So much the better for those who have the courage to buy,' said Alice as she rose to go. 'I will call in again between three and four. Meanwhile, if there are any more to be had, buy them.'

At three forty-five Mrs Rivers was again at Mr Boucher's office.

'A few more were offered to-day and I bought them,' were the broker's first words. 'Singular to say, Simmonds, your father's broker, has been inquiring after Deep Lips all day. Hearing that I had bought heavily yesterday, he sent on one of his people to know whether I had any to dispose of, even going to the extent of offering three and an eighth more than this morning's quotation; but in the absence of any instructions from you, I declined all overtures.'

'You did quite right, Mr Boucher. Don't part with a single share till you have my instructions to do so. Meanwhile, as it is nearly mid-day before the newspapers reach us down at Leaswood, I shall be glad if you will telegraph the closing price to me each afternoon.'

'Sharp girl that, very—regular chip of the old block,' was Boucher's comment to himself as he ran through the telegraphic news in next morning's *Times*, where the following paragraph at once caught his attention: 'Reliable advices from San Francisco state that the Deep Lip Silver Mining Company have just struck a vein of unusual thickness. Shares going up rapidly.'

A few days later, as Gerald was seated behind the open pigeon-hole of his little office waiting to book any passengers who might be going by the next train, his attention was attracted by the loud tones of two people in the waiting-room outside.

'I tell you, Stopford, I was never more annoyed in my life,' said one, and Gerald knew at once who was the speaker. 'My brother, who, as he thought, had got the information before it was known to any one else in New York, was actually at the trouble to send me a message by cable telling me to buy up all the Deep Lips I could lay hands on. Of course, I acted on the message without an hour's unnecessary delay; but, would you believe it, when Simmonds went on 'Change next morning there was not a single Deep Lip to be had! Some vagabond had been there before me and had bought up every mother's son of 'em, and now they're going up like wild-fire. Thousands out of my pocket. Never was so sold in my life before.'

'Why now, Crewdson, that only goes to prove that there are other speculators in the world as clever as you.'

'They were bought through Boucher too. But he's as close as wax. No getting a word out of him. Some confounded Yank's at the bottom of it all, never fear.'

Mr Crewdson had stated no more than the truth when he said that the Deep Lip shares were going up like wild-fire. Alice had a telegram from Mr Boucher every afternoon. It was an anxious time for her. For three weeks the shares went up day by day. At the end of that time they re-

mained stationary for two days. The following morning they dropped one-eighth. Alice at once took alarm, and telegraphed Boucher to sell everything. Three days later a post-letter reached her. 'Read the news, dear, and resign your railway situation at once,' she said to her husband as she handed him the letter.

'Seven thousand five hundred and fifty pounds!' read Gerald in amazement.

'Yes; and all out of one lucky speculation in Deep Lip shares. Now, I am ready to go to papa.'

And to her father she went; but not till after Gerald had sought and found relief from his duties at Leaswood. Mr Crewdson made *Old Furnival's Hotel* his home when in London, and there it was that Alice sought and found him. As fortune would have it, Sir Charles Stopford happened to be lunching with his friend that morning. Mrs Rivers hardly gave the waiter time to announce her before she followed him into the room. Mr Crewdson started up from his chair.

'Why—Alice! You here! Why have you come? What is the meaning of this intrusion?' But before he could say another word his daughter's arms were round his neck, and her warm kisses were being rained over his face. 'Did I not forbid you?' he said. 'Did I not say that I would not see you?'

'You did, papa; and very hard I thought it of you. You did forbid me to come near you unless I could fulfil the one condition named in your letter.'

'Condition, indeed! I remember nothing about any condition. What on earth do you mean?'

'Did you not say in the only letter you have written me since my marriage that on the day I could bring you six thousand pounds—being an equivalent to the dowry you at one time intended to give me—you would forgive and forget everything, and take your little Alice back again to your heart? Surely, surely you cannot have forgotten!'

'And did I really say all that?'

'Certainly you did. I have your letter in my pocket. You shall read your own words if you like.'

'No need, girl—no need. My memory is treacherous at times; but I've not quite forgotten that letter. So you've come to tell me that my condition was too hard a one, that you and your poverty-stricken husband—'

'One moment, papa. I come to tell you that your condition is fulfilled—is more than fulfilled. Here is my bank-book. Look inside it, and there you will find standing in the name of Gerald Rivers—my husband's name—a deposit of seven thousand five hundred pounds.'

'Why now, really this is most extraordinary!' exclaimed Sir Charles.

Mr Crewdson said nothing; but his hands trembled so much as he took the bank-book that he could hardly hold it. He turned redder than ever, and then he cleared his voice loudly and put on his most portentous frown. Then he opened the book and looked vacantly at the writing for a moment or two, and then with a muttered exclamation he shut the book and threw it across the table to Sir Charles. 'Those bank fellows write such a villainous scrawl that there's no making head or tail of their pot-hooks,' he said.

'Here it is, sure enough,' said Sir Charles, peering at the figures through his double eye-glasses. 'An amount of seven thousand five hundred pounds deposited three days ago in the Westminster Bank to the credit of Gerald Rivers.'

But Alice was on her father's knee by this time, and had her arms round his neck, and was kissing him with tears in her eyes and a smile on her lips.

'You'll have to give way, old friend, there's not a doubt of it,' continued Sir Charles, 'if you made such a promise as my god-daughter says you made.'

'You were not only to forgive me, papa, but you were to give me another six thousand pounds to put to my husband's.'

'But—but—I don't understand,' stammered Mr Crewdson. 'I thought you had married a man who was not worth a penny?'

'My husband on our wedding-day was worth just twenty pounds in hard cash.'

'Then this is a legacy, I suppose?'

'No; not a legacy. We have been taking a leaf out of your book, papa, and speculating on 'Change.'

'Speculating! And is this the result?'

'That is the result.'

'Her father's daughter; I always said she was,' soliloquised Sir Charles. 'What a pity she wasn't born a boy!'

'Then you must have been deucedly lucky—far more lucky than I've been for a very long time. May I ask the name of the particular stock which you favoured with your confidence?'

'Gerald and I made all our money by speculating in Deep Lip mining shares.'

Mr Crewdson sat aghast, and well he might.

'Where is this husband of yours?' he gasped out at length.

'Gerald is waiting outside.'

'Bring him in, and let us have a look at him.'

But it was not till more than a year afterwards, when Gerald had grown to be like a son of his own to the old man, that Alice told her father by what means she had become possessed of the information which enabled her to achieve such a happy result by her bold speculation in Deep Lip shares. It is needless to add that she was forgiven.

ODD ANNOUNCEMENTS.

ANNOUNCEMENTS, either in the newspapers or posted up for the perusal of all comers, are sometimes so droll that we have selected one or two for the amusement of our readers.

Mr Caudal of Kansas, who thought it necessary to advertise that he had brought his wooing to a successful issue, issued the following notice: 'From this time forth, hereafter and for ever, until Miss Anne Gould becomes a widow, all young men are requested to withdraw their particular attentions.' In less happy plight was the ousted lover who thus addressed his supplanter in the columns of the *General Advertiser*: 'Whereas, on Sunday April 12th 1750, there was seen in Cheapside, between the hours of four and five in the afternoon, a young gentleman, dressed in a light-coloured coat, with a blue waistcoat trimmed with

silver lace, along with a young lady in mourning, going towards St Martin's, near Aldersgate. This is therefore to acquaint the said gentleman (as a friend) to be as expeditious as possible in the affair, lest otherwise he should unhappily meet with the same disappointment at last, by another stepping in, in the meantime; as a young gentleman has been lately served by the aforesaid young lady, who, after a courtship of these four months last past, and that with her approbation, and in the most public manner possible, and with the utmost honour as could possibly become a gentleman. Take this sir, as a friendly hint.'

Another victim of feminine fickleness, disinclined to accept his dismissal, lately issued the following 'Card' in the *Humboldt Times*: 'Warning to hum it me concernt—Missis Christine Rossow, wido of Gotfried Rossow desisad, had prommisset me to go in the bounds of matrimony with me. From anknowing grounds now she decline to fulfill her prommisses. In regard to that I heard from good autorita that zum underhandet game bin plait behint my bac, from zum anprinciple fellos, knoingly, given my prommisset bride boggy rides and promenadings; probably der is were the rabbit lais in the pepper. Bout to there bennefit I publicly notefy them herewith, keep hands of, or prosscution in lawoffle way will follow. I intende to let them not impose and tramp on me.—FREDERICK HELLER.'

The jilted one might have couched his defiant complaint in better English, still he attains greater intelligibility than the concoctor of a notice once, if not now, to be seen at a Welsh railway station: 'List of Booking. You passengers must careful. For have their level money for tickets, and to apply at once for asking tickets when will booking window open; no tickets to have after departure of the train.' Somebody blundered too, when the South-eastern Railway carriages were placarded: 'Compartments are reserved for passengers wishing to smoke, and they are labelled to that effect; an intimation as ambiguous as the Western blacksmith's: 'No hosses shodded Sundays except Sickness and Death; and as likely to be wrongly interpreted as the warning: 'Young ladies should set good examples, for young men will follow them,' which some one chalked on the wall of a Young Ladies' School, for the edification of the fair students.

It would never do to take some things as read. A religious journal announcing a forthcoming fancy-fair, told its readers: 'The annual sale of the ladies of the society will take place on Thursday next.' A Boston café-keeper, after calling attention to his choice wines, cigars, and oysters, adds: 'Families and parties supplied either on shell, per gallon, or cooked to order; and a shoemaker advertises his readiness to furnish boys and girls at all prices, and boasts that his babies' department pleases everybody, offering 'the greatest choice in the world.' Such an announcement might be taken literally, if it met one's eyes in New York, where 'Babies or children exchanged' challenges the attention in a shop-window, and is only one of many strange notifications.

To be Jack of all trades rather than master of one is now a common aim, so we are not at all astonished at the versatile Anna Aguker announcing that she 'attends as sick-nurse, watches dead

bodies, repairs straw chairs, applies leeches, and makes pastries, desserts, and delicacies.' Equally anxious to turn a penny in one way or another is the denizen of a London back-street, whose modest card runs: 'Goods removed, messages taken, carpets beaten, and poetry composed on any subject.' But this inglorious Milton must yield the palm to Burness and Son, on whose signboard, put up some sixty years ago, was to be read: 'Blacksmith's and barber's work done here, horse-shoeing and shaving, locks mended and hare-curved, bleeding, teeth-drawing, and all other farriery work; all sorts of spirates lickor akording to the late comerce treaty. Tak notis; my wife keeps skool and lerns folks as yu shall; teches reading and riting, and all other langurtches, and has assistants if required, to teach horritory, sowing, the mathe-matics, and all other fashionable diversions.'

The orthographical originality displayed by Burness and Son would have delighted Artemus Ward. Says that pleasant writer somewhere: 'Sweetness is tiresome, variety is pleasing. I have a correspondent whose letters are a refreshment to me; there is such a breezy unfettered originality about his orthography. He always spells cow with a large K. Now that is just as good as to spell it with a small one. It is better. It gives the imagination a broader field, wider scope. It suggests to the mind a grand, impressive, new kind of cow.' Obadiah Rogers thought a little k answered the purpose equally well, giving all whom it might concern due 'nottis' that 'know kow is alloued in these medders, eny men or women letten there kows run the rode wot gits inter my medders aforesaid, shall have his tail cut off by me.' As unconventional a speller as Obadiah or the showman's friend was the Missourian who wrote on his fence: 'Ce hear! Eye don't want ennybodi that has hosses which has the eppidutick influence or any uthor name to cum thru this gait. Kep shi!'—a warning probably as effective as the more verbose notice a sportsman came across in Indiana, which ran thus: 'Notis, to men who cum on my plais with guns, hurrayng voices and braying dogs, ashooting and akilling my gaim. I will no longer stand it, for I have only three coveys of quales and not to exceed ten squerrels on my plais which I want for myself, and to those men who bring there dogs and hurrayng voices here akilling my birds will be fined according as law for I want all the woodpeckers as they are by nature a ravishing animal for worms and such-like, and my jay-birds hurt no won, and if let alone will help me muchly in the spring to keep away grewb worms and the like. I want all my woodchucks for my eteing as I never disturb them, keeping them to get fat, when they air worth to me as mutch as my chickens air. I say this to inform sum fools from Logansport who seem to like to kill my woodchucks and says for the fun I mean business as shure as I now sine my name.' This worthy would have done better to have imitated the brevity of the game-preservee up North, who said his say in four words: 'No Gunen Aloud Here!'

Far more satisfactory to contemplate must have been the board of the Arkansas ferryman, with its hospitable intimation: 'Ef ennybody cums hear, arter lickor, or to git across the river, they can jes blow this hear horn, and ef I don't cum when my Betsy up at the hous hears the horn blown, she'll

cum down and sell them the lick or set them across the river when i'm away from hoam.—JOHN WILSON. *N.B.*—Them that can't red will have to go to the Hous arter Betsy, taint but half a mile there.'

ITEMS OF AMERICAN FARMING.

ON the present exciting subject of American farming, there occur the following items in the letter of a correspondent of *The Times*:

'Farming on a scale unparalleled except in California is prosecuted in the Red River Valley. This dates from the year 1875, when several capitalists bought vast tracts of land there. Mr B. P. Cheney of Boston, and Mr Oliver Dalrymple of St Paul, purchased five thousand acres, of which three thousand five hundred will be under cultivation this spring. Last year they harvested forty-two thousand bushels of wheat, six thousand of oats, and three thousand of barley. The machinery on this farm consists of forty ploughs, sixteen seeders, forty harrows, sixteen harvesters, three steam thrashing-machines, and three portable steam-engines. As many as a hundred men are employed at the busiest season. Mr Cass has a farm of six thousand acres. Nearly the whole will be sown with wheat this year. Large though these farms are, yet they seem small in comparison with that belonging to Mr William Dalrymple; it covers thirty square miles. The quantity sown with wheat last year was twenty thousand nine hundred acres; the yield was two hundred and fifty thousand bushels. Seventy-five reaping and binding machines were used to harvest the crop, the work being done at the rate of one thousand acres a day. This farm is managed on the plan of a factory. It is divided into sections of two thousand acres, over each of which an overseer is placed; he carries out the orders of Mr Dalrymple just as a brigadier-general carries out the orders of the commander-in-chief of an army. Comfortable dwellings are provided for the overseers, while there is a boarding-house for the accommodation of the farm-labourers. Each section has its granary, stables, machine-shop, and engine-house. Indeed, the vast estate is really divided into a number of separate farms, each being complete in itself, and all being subject to a common head. Four hundred and fifty labourers and upwards of three hundred horses and mules are employed on this farm; three book-keepers are required to register the accounts, and two cashiers to receive and disburse the money. Indeed, the whole arrangements are designed to assimilate the production of grain to the operations of a manufactory. The idyllic side of farming has no place here. The farmer is a capitalist, and the farm-labourer is called a "hand" and treated as one. Advocates of spade-husbandry will see nothing to admire in this wholesale method of cultivating the soil, and they will maintain that if this system should grow in favour, the day must arrive when, in the United States as in certain European countries, there will be a permanent and rigid separation between the tillers of the soil and its owners. However, while

land continues as plentiful and easily acquired in the United States as it was during the Middle Ages, when the existing large estates were formed in Europe, the citizens of that country will disregard gloomy forebodings and will continue to lavish their admiration upon a successful capitalist like Mr Dalrymple. His farm is a common topic of glorification among the citizens of the new North-west, and of admiring envy among the dwellers in less fertile parts of the land.'

In reporting the extent of cereal crops in America, it is not usually considered that the enormous production is due to the virgin fertility of the soil, which must in time be exhausted, and require the recruitment of manures. In a few years, the land must either be supplemented by restoratives, or go out of cultivation. The day of agricultural difficulty is coming in the New World, as it long since came in the Old.

SUMMER ON THE WANE.

BRIEF grow the waning days; the poplars shed
Their serried showers of crimson o'er the path,
And gathering swallows, on the river-brink,
Twit their departing notes. The dusky bats
Begin to congregate beneath the eaves,
Dreaming of winter-sleep; the lazy pike
Bask on the river-surface, revelling
In the last warmth of Summer.

On the elms,
The speckled starlings gathering, loud hold
A noisy council; and the blue-barred jays,
White-banded magpies, and spruce jackdaws join
To swell the clamorous chorus.

On the bank,
The warm South bank—purple shine forth the bells
Of Autumn violets, last lingerers,
When gone, the flowers of Summer! So, oft shines
A virtuous life, unrecognised, unknown,
By a censorious world!

Close in, the days,
With gray, yet golden twilight; Winter comes,
Comes on apace, and his white-shrouding snows
Again shall shortly veil the slumbering Earth!

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'
- 2d. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.
- 3d. MANUSCRIPTS should bear the author's full *Christian* name, surname, and address, legibly written.
- 4th. MS. should be written on one side of the leaf only.
- 5th. Poetical offerings should be accompanied by an envelope, stamped and directed.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

OUR OCEAN MAIL-STEAMERS.

It would be difficult to name any grander product of modern invention than the magnificent ocean mail-steamers which convey our letters from England to—almost literally—the uttermost parts of the earth. The excellence of the materials used; the perfection of the workmanship; the amount of space obtained in proportion to the weight; the economy of fuel in raising steam rapidly; the labour-saving appliances in every part of the majestic floating fabric; the use of telegraphy and telephony in the instantaneous conveyance of messages and instructions from one compartment to another; the almost unerring punctuality in departure and arrival; and the luxurious accommodation for passengers—all combine to make an ocean mail-steamer a 'thing of beauty' if not a 'joy for ever.'

The point which we take up on the present occasion is, not the excellence of the arrangements made by the several Companies, but the manner in which the public benefit by healthy competition. In proportion as the mail-steamers carry more passengers and more freight, the smaller is the sum paid by the Postmaster-general for the conveyance of the British mails from Great Britain to various quarters of the globe.

Let us glance at the North American mails, from England to Canada and the United States. Cunard, as most of our readers know, has been the most famous name in connection with this route. Mr—afterwards Sir Samuel—Cunard joined in partnership with Messrs Burns and M'Iver, built splendid ocean-going steamers, and organised a system so admirable as to satisfy alike the postal authorities, the travelling public, and the shippers of merchandise. For many years the Cunard Company stood alone; but the irrepressible energy of Liverpool men has in later times studded the Atlantic with numerous fleets of magnificent mail-steamers. By degrees the Postmaster-general recognised the expediency of admitting these other Companies, or some of them, to share with Messrs Cunard the transatlantic mail-service;

the result of which has been a lowering of the cost for conveying letters across the Atlantic.

Two systems have been acted upon: (1) a fixed subsidy for carrying all the mails that may be presented on certain days; and (2) an ocean freight according to the weight of each mail. From 1868 to 1876 inclusive, Messrs Cunard performed their share of the work for seventy thousand a year; Messrs Inman took a smaller portion for thirty-five thousand pounds a year; while the North German Lloyd were paid by weight. At first the ocean postage paid by government to the Companies was one shilling per ounce for letters, threepence per pound for newspapers, and fivepence per pound for book-packets. In 1870 a sudden fall from one shilling to threepence per ounce took place for letters—unquestionably a great advantage to the public on both sides of the Atlantic. At length, in 1877, new contracts were entered into, which admitted no fewer than six Companies to participate in the work—namely the Cunard, the Inman, the Anchor, the Guion, the White Star, and the North German Lloyd. Fixed subsidies were abandoned: all the Companies being paid according to the weight of mails they carry—so much per pound for letters, newspapers, and book-packets respectively. The postal authorities—and therefore the public—are gaining largely by this change, the aggregate payment to the Companies being very much smaller than at any former period. But the truth is, that the passenger traffic *plus* the merchandise freight by these fine steamers is so immense—allowance made for stagnant trade in dull seasons—that the Companies can afford to regard the mails as only a small item in their yearly business. An incessant stream of these noble steamers issues from Liverpool. Glasgow has a share, and so has Southampton; but Liverpool rules the trade. Glance at the shipping announcements, and we shall see that nearly every day in the week witnesses the departure of a mail-steamer, marvellous for the accuracy with which it times its voyage.

Let us next direct similar attention to the West India mail system, by far the most compli-

cated which the Postmaster-general has to manage. The West India islands are so numerous and so widely scattered that the mail-steamers can with difficulty be made to accommodate all of them. Unless highly paid, no Company would undertake the work; and so large is the fleet necessary, that only one Company—the Royal Mail Steam-packet Company—ventures to take the contract. Competition has in various ways, however, compelled or induced the Company to accept a much lower subsidy than in former times. A contract was in force from 1874 to 1878, whereby the Company performed the work for a subsidy of eighty-four thousand seven hundred and fifty pounds per annum. When that contract was about to expire, the Postmaster-general invited tenders for a new one; but, from the causes already indicated, the old Company retained its place. The service will be conducted for a term of years under the new contract, which is just coming into operation.

If the reader will spread out a map of the West Indies before him, he will see how remarkable is the network which brings them all into one postal system. In the first place, a steamer of magnificent dimensions and power starts from Southampton on the 2d of every month, calls at St Thomas, Port-au-Prince, and Jamaica, and ends its voyage at Colon, the Atlantic terminus of the Isthmus of Panama Railway. The distance, about five thousand five hundred miles, is traversed in twenty-one days. In the second place, other and smaller packets distribute to the various islands the mails brought across the Atlantic by the grand ocean steamer; but of this presently. On the 17th of every month another fine steamer leaves Southampton for Barbadoes, St Thomas, Jacmel, Jamaica, and Colon, five thousand three hundred and fifty miles, performed in about twenty days. The smaller mail-packets have their appointed work to do, strictly intercolonial. Once a month, the mails received at St Thomas from England are sorted, and—according to their destinations—are at once forwarded by subsidiary packets to St Kitt's, Antigua, Guadaloupe, Dominica, Martinique, St Lucia, Barbadoes, St Vincent, Grenada, Trinidad, and Demerara—all of them islands except the last. The same subsidiary steamer, after a short stay at Demerara, retraces its path, taking in and putting out mails at all the several islands. This run, from St Thomas back to St Thomas, is about two thousand two hundred miles, and occupies thirteen days. Another route, performed by another subsidiary steamer, in an intermediate part of the month, brings in Tobago as a link in the chain, and helps to maintain mail communication between every island and every other island, as well as between the whole of them and the mother-country. There are as many as nine of these curious voyages always going on at once, involving the use of a large number of steamers. Some of the ports of Central America are also accommodated; once a month a subsidiary packet runs from Colón to Carthagena and Savanilla; and another from Colon to Port Limon and Grey Town.

The steamers that make the voyage to and from England are of fine dimensions, nearly three thousand tons register, and with steam-power adequate to a speed of nearly twelve miles an hour. The Company complain that the subsidy is too small for the services rendered; but the dull state of

trade in the West Indies, by lessening passenger and merchandise traffic, is the chief evil they have to contend against.

We turn our glance once again in a new direction, to a region the most interesting of all in connection with ocean mail-steaming. If the transatlantic service excels all others in the vast number of letters, newspapers, and book-packets conveyed; if the West India service takes the lead in complexity of voyages—the Peninsular and Oriental service unquestionably eclipses them both in its history, the great length of the voyages, and the largeness of the subsidy.

The energetic Lieutenant Waghorn was the first to give this system a start. In the old days a four months' voyage round the Cape of Good Hope to Calcutta was a thing of course. A new route to the East by way of the Euphrates took hold of the sympathies of many Anglo-Indians, and has been frequently advocated, but has been dropped after each spurt of advocacy. While this idea was being mooted, Lieutenant Waghorn threw himself heart and soul into a scheme for a Red Sea route to the East. By wonderful perseverance he succeeded in shewing the practicability of his scheme, and in enlisting the sanction of the home authorities and of the East India Company in its favour. In 1838, the Anglo-Indian mails began to be conveyed by this route. There was at the time an ocean mail conducted by the Peninsular Company as far as Lisbon and Gibraltar; an extension of voyage right through the Mediterranean was organised, as a link in Waghorn's chain; and then the Company took the name of the Peninsular and Oriental, familiarly shortened to P. and O. Afterwards, mail-steamers were put on from Suez to Aden, Bombay, Ceylon, Madras, Calcutta, Singapore, China, and Australia, completing a magnificent postal service from England to all parts of the East. No Suez Canal being in existence in those days, the mails were of necessity conveyed by land transport through Egypt from Alexandria to Suez; and this gave the name of the *Overland Route* to the whole system.

Many contracts, each for a term of years, have been entered into between the Postmaster-general and the Peninsular and Oriental Company. One that was in force for a few years previously to 1874 provided—as before—for land transport through Egypt. The mails were landed from the Mediterranean steamers at Alexandria, carried from that port to Suez by rail, and placed on board other steamers which went by way of the Red Sea to India, China, and Australia. When this contract expired in 1874, the Company proposed to avail themselves of the Suez Canal, abandoning the overland route. The Postmaster-general assented to this; and a new contract was entered into, to remain in force until 1880. The subsidy has always been a large one, heavier than any other connected with our ocean mails; it was four hundred and fifty thousand pounds a year, and is now four hundred and twenty thousand pounds. Only the heavy mails at cheap rates of postage are thus conveyed through the Suez Canal; the express mails at higher postage continue to make use of the railway through Egypt.

The mail service performed by the Peninsular and Oriental Company is certainly a splendid one. Once a week a fine ocean mail-steamer leaves Southampton, coasts down the Atlantic to Gibraltar,

traverses nearly the whole length of the Mediterranean, passes through the Suez Canal, and thence through the Red Sea to Aden. Once a week, for the express or high tariff mails, a steamer starts from Brindisi, in the south-east of Italy, makes a rapid run to Alexandria, and then transfers its mails to the Egyptian railway, to be again embarked on steamers at Suez. This route '*via* Brindisi,' is found to be the most expeditious one yet adopted of conveying the mails from England to the East; there is a continuous railway-train run at express speed through France and Italy, from Calais—*via* the Mont Cenis tunnel—to Brindisi; the speed of the Brindisi-Alexandria steamers is very high; and the railway transit through Egypt occupies a much smaller number of hours than the voyage through the Suez Canal. Of course the public pay higher for this great celerity, in postage, passenger fares, and merchandise freight; but there is the Southampton and Mediterranean service for the great bulk of the work to be done.

The mails leaving in this twofold way being conveyed from England to Suez, the Peninsular and Oriental have organised a grand system for distributing them throughout the East. Once a week a mail-steamer starts from Suez for Aden and Bombay. Once a fortnight another steamer starts from Suez for Aden, Ceylon, Madras, and Calcutta. Once a fortnight a third steamer, starting from Ceylon, conveys the mails which have been sent out to China and Japan. A new contract, some particulars of which will be found at the end of this article, will come into force in February 1880.

So thoroughly reliable are the fine steamers engaged in this service, that the Peninsular and Oriental undertake to be punctual even to a single hour in a long voyage. Brindisi to Bombay three hundred and sixty-eight hours, including seventeen hours of land transit through Egypt; the return route three hundred and seventy-five hours at most seasons of the year, but four hundred and twenty-three hours during the south-west monsoon. Brindisi to Shanghai in China nine hundred and forty-seven hours during the north-east monsoon, and eight hundred and seventy-five during the remainder of the year, including the time occupied by the railway run through Egypt. The return voyage, owing to adverse winds and currents, is more prolonged than the outward; from Shanghai to Brindisi occupying one thousand and six hours during the south-west monsoon, and nine hundred and ten at other seasons. It is little less than marvellous that the Company will not only undertake this rigorous punctuality, but will consent to be fined for any delay.

From a parliamentary paper issued during the past session, we learn that on 1st June 1878, there was signed at Paris an International Convention, under which the postal business of the world is now regulated. The rules laid down in this Convention came into operation in April of the present year, so that the public has had a few months' experience of those changes which the delegates effected. Practically, the outcome of the deliberations may be held to be the establishment of ocean postage on a footing which comes near to 'ocean penny postage.' At the meeting at Berne in 1874, at which the 'General Postal Union' was established, the countries represented were, with the

exception of the United States of America and Egypt, exclusively European. At the Paris meeting in 1878, however, a wider title, that of the 'Universal Postal Union,' was adopted; and its right to assume such a name will be admitted when it is known that, besides the whole of the European states, the Convention embraced delegates from the Argentine Republic, Brazil, British India, Canada, Mexico, Persia, Japan, and the eastern and western colonies of Britain, France, Spain, and Holland. Indeed the Australian and South African colonies of Great Britain alone were wanting to make the union co-extensive with the civilised world. An announcement, however, has been made that Victoria and her partner colonies South Australia and Tasmania, have signed a contract with the Peninsular and Oriental Company, to be in force from 1880 to 1888, for a *fortnightly* mail from the mother country to the above-named colonies. The mails will be carried by the same ocean steamers as those which accommodate India and China—transshipment taking place at Ceylon. If this work be well done, Australia will have more complete mail service than at any former period.

Under the Convention, post-cards between the various countries of the Postal Union are to be charged ten centimes (one penny), and we have thus actually an 'ocean penny postage' with the United States and Canada, though, owing to certain stipulations in the treaty regarding allowances for sea or territorial transit, the cost of a post-card to British India, for example, is three-halfpence or twopence, by Southampton and Brindisi.

THE BRAVE SWISS BOY.

CHAPTER IV.—WALTER HAS A NEW ADVENTURE.

TONI HIRZEL recovered but slowly from the injuries he had suffered, and the entire winter passed away before he found himself able to make use of his limbs again. But the doctor's fears that he would never be able to resume the life of a mountaineer, were unfortunately confirmed. He never properly recovered the use of his foot; and Toni often cast a sorrowful glance at the gun, now hanging uselessly on the wall. To this cause of regret there was added anxiety for the future. The chase, which had hitherto so materially assisted in supplying his wants, could no longer be followed; and although Walter had grown tall and strong, he was not experienced enough to take his father's place. In addition to this, Hirzel had expressly forbidden his boy to have anything more to do with hunting, which sooner or later would be sure to lead to a violent and dreadful death; and in order to remove temptation as much as possible from him, he sold his gun to one of his neighbours.

'Now, Watty,' said he, putting the eighty francs which he had received into a drawer, 'we have got nearly money enough for another cow; and we must see if we can't raise the remainder, that we may have at least milk and butter.'

'We have got plenty of money, father,' replied Watty. 'There is the hundred francs that Mr Seymour gave me lying uselessly in the desk, and I insist upon your taking the half of it at least, to replenish the byre. But,' added he with a sigh, 'without chamois-hunting I do not see how matters are to go with us. Do you know, father,

I have been thinking that I might do something to earn my living.'

'In what way, Watty?'

'Well, I might go down to the inn every day, and offer my services to the visitors as a guide. I know all the roads, and can shew the people the way to the Blue Grotto, or conduct them to the peaks of the Wellhorn and Engelhorn; and as the landlord is always so friendly, I'm sure he would recommend me.'

'Not a bad idea,' replied Hirzel. 'To be sure, it is only for the summer; but as there are always a good many travellers, you might be able to save enough to carry you through the winter. Turn guide, then, Watty,' he added, after a little more consideration; 'and I will stay at home and attend to the house and the cow. Let us be thankful I'm strong enough for that at anyrate.'

The plan of operations which was thus arranged was not, however, destined to be carried into operation, for the next day Frieshardt came to pay a visit to the cottage with a proposal of quite a different kind. He had shewn himself very attentive and neighbourly since Hirzel's accident, and had given him proofs of kindly feeling during the period of his convalescence. The old friendship had therefore been fully restored, and the affair of the cow and the borrowed money had been long since forgotten. Hirzel rose as Frieshardt entered, and gave him a hearty welcome, in which he was cordially joined by Walter.

'I have got a suggestion to make to you, neighbour,' said the well-to-do farmer, seating himself near the fire.

'To me!' exclaimed Hirzel. 'What can a poor man like me do to serve you?'

'I don't mean you so much as Watty,' continued Frieshardt. 'He has grown a tall sensible fellow now, and I know he is honest, every inch of him.'

'Ah! you are right there, neighbour, although I say it to his face,' replied Hirzel.—'You don't need to blush, boy. It is nothing more than your duty to behave honestly.—But what can Watty do for you?'

'Well, the long and the short of the matter is this,' said the farmer. 'I've got sixty head of cattle down in Meyringen, which I am going to send to France to sell. A drover has been recommended to me who understands the business; but I should like to send some reliable person with him to look after the money, and see that everything is properly attended to. I think Walter would be the man for me, if he will agree to it. He shall have good wages, and everything done to make him comfortable.'

Father and son exchanged looks, and each saw in the countenance of the other that the proposal was a good one. 'If my father is satisfied,' said the youth, 'I shall be delighted to go.'

'Well said,' replied Frieshardt, evidently pleased. 'Now let's hear what you want for the journey.'

'I would rather you would say what you will give,' answered Walter. 'I don't understand such things very well.'

'Well then, I'll pay all your expenses there and back, and give you a hundred francs into the bargain. Are you satisfied with that?'

'Yes; more than satisfied,' replied the boy. 'But I should like it better if you would give father a cow now, instead of giving me the

money afterwards. I should be glad indeed, if he could get one before I go away.'

'But what would you want for yourself when you came back?'

'Nothing, neighbour. If you will only grant my request I shall be quite contented and thankful.'

'Well,' said Frieshardt, 'you are a dutiful and kind-hearted son, and I'm sure you will be a faithful servant. You shall have my cow, Black Elsy, and your father can fetch her whenever he chooses. Meanwhile, you must be ready to go to Meyringen to-morrow morning,' continued Frieshardt. 'I will go with you, and give you all the instructions you will require. It won't be a difficult affair, and I'm sure you will manage it easily. Adieu, till morning!'

With these cheering words the farmer left Walter and his father to talk over the unexpected change in their fortunes.

'Father!' exclaimed the delighted youth, 'your wish is fulfilled sooner than you expected, and you will now be able to get more goats. And who knows what good fortune may attend me in France! It will be a grand journey for me!'

'You will have my blessing with you, Watty; and I hope you will always have the fear of God before your eyes, and His love in your heart. Trust in the Lord, and ever act honestly by your fellow-creatures, and you need never fear.'

Shortly afterwards, Walter repaired to Frieshardt's farm, and came back leading Black Elsy in triumph; and after taking farewell of his father, returned to Frieshardt's house on the following morning. The route which Walter's employer chose led them past the splendid waterfalls of the Reichenbach to the charming village of Meyringen, where the cattle were collected. When they reached the village, they found a drover of the name of Seppi waiting for them; and to the latter as well as to Walter the farmer gave the necessary instructions regarding the treatment of the herd during the ensuing journey. He enjoined them to be sparing with their expenses on the road, and to keep the interest of their employer always before their minds. Then, after handing to Walter a list of the animals, with the prices for which they were to be sold, Frieshardt returned home, taking with him Walter's last greetings to his father. And with this farewell message, the young man temporarily banished the thought of home from his mind, and devoted himself energetically to the discharge of his new duties.

Our young hero entered upon the journey actuated by the best of motives, the duty of looking after the cattle absorbing so much of his attention that he had very little opportunity for increasing his acquaintance with his travelling companion. The fact was, however, that he did not feel himself much drawn towards Seppi, from whom he had received anything but a very friendly welcome when they first met; the drover had, moreover, a rough and uncultivated manner, which was somewhat repulsive. His treatment of the animals was unduly harsh when any of them became restive and obstinate, and he seemed angry when Walter checked his cruel behaviour, and pointed out to him that the dumb animals intrusted to his care should be treated with kindness and patience. But by degrees the

young men became more reconciled to each other; and as Walter accustomed himself to the ungainly appearance of his companion, he came to the generous conclusion that Seppi had an honest and well-meaning heart in spite of his rough and unpolished ways.

They soon reached the French frontier, and after a long journey, found themselves in the outskirts of Paris. Walter had arranged the stages so well that the animals were in admirable condition, and warranted the expectation of a good and prompt sale. Seppi was of the same opinion, and said he thought they would sell for even more than the price Frieshardt had named.

'I think they will,' assented Walter cheerfully. 'The cattle are in splendid order; and we'll see if we can't astonish Mr Frieshardt when we get home.'

'Ay, ay; we shall see,' echoed Seppi with a peculiar expression of voice.

The intelligence of the arrival of a drove of fine cattle from Switzerland was quickly spread, and when Seppi and Walter appeared in the market there was no lack of buyers. The youth attended to the selling, in accordance with his employer's wish, and although he asked higher prices than those which had been fixed, he had got rid of half the number at the end of the first day. The remainder were also satisfactorily disposed of, on the two following days; and having changed the drafts he had received into gold and notes, in which Seppi's experience was of great use to him, he prepared to return home.

'But why need we be in such a hurry?' inquired Seppi.

'Because we've nothing more to stay for, and the longer we stay here the more expense we shall cause to Mr Frieshardt, and that would be very wrong.'

'But you are surely not going back without seeing something of Paris?' continued the other. 'You must go and see all the splendid buildings; besides, we've no need to say that we sold all the cattle in three days.'

'That I should think still worse,' was the simple answer. 'I have promised to serve Frieshardt faithfully, and I mean to keep my word.'

'Well, you can tell him that you stopped here a couple of days to see the town,' continued the tempter. 'As we have got such a capital price for the cattle, he won't find any fault with us for that.'

'I don't care,' persisted Walter. 'I've no right to stay, and I mean to start to-morrow morning.'

The drover said no more, but merely shrugged his shoulders. After a long interval he recommenced his attack. 'You must be very soft, Walter,' said he. 'If you were only a little more wide-awake, we might make a good thing for ourselves out of this affair, and no one be any the wiser.'

'In what way?'

'Don't you see what I mean?' continued Seppi with a cunning smile. 'You've got about one-third more cash than Frieshardt expects. What is there to hinder us from dividing it between us? It would be a good thing for us, and nobody could ever find it out, because we should both keep it dark.'

'I hope you are only joking,' said Walter with a serious look. 'Do you think I am going to swindle my master, because he has put so much confidence in me? You can't surely be in earnest, Seppi. You only want to test my honesty.'

'Bother your honesty,' returned Seppi. 'Sharpness is better than honesty, now-a-days. You've got more than thirty thousand francs in that belt round your waist; we've only got to divide it between us, and then we could lead a glorious life in Paris. No one could ever find us out, for the city is so large that Frieshardt might search for weeks before getting on our track. Look at that, Walter! You'll perhaps never have such a splendid chance again as long as you live. What have you to lose at home? Nothing! You'll only be a poor half-starved fellow if you go back. Now's your time! Seize the opportunity at once, like a man!'

Walter listened to the wicked proposition of his companion with indignation, which he made no attempt to conceal. 'What!' he exclaimed in a burst of anger, 'would you have me sell my home and my good conscience for the sake of a little money? Shall I disgrace myself for ever, and break my father's heart? Shall I break the laws of God and man? No; not for all the gold in the universe! I would rather beg my bread from door to door than commit such a sin. O Seppi, what a heart you must have to be able even to think of such a thing!'

Walter's earnest words were followed by a loud burst of laughter from his companion. 'Don't fly into a rage, comrade, and excite yourself that way,' said Seppi. 'You don't seem to know what a joke is. Just as if we could pocket all that money without the police being at our heels directly! Why, we should get at least ten years' imprisonment without any matter of doubt. No, no; I merely wanted to see whether you were really as honest and straightforward as Frieshardt made you out to be, and I see he didn't praise you more than you deserve. Give me your hand, old fellow, and believe me when I tell you that you shall never be tried this way again. If you like, I will leave Paris with you this very night, to prove to you that I was only making fun.'

Walter drew a long breath. 'Thank God that it was only a joke!' said he, returning the friendly grasp of Seppi, of whose thorough sincerity he seemed to entertain no longer any doubt. 'I am quite agreeable to start to-night, for so much money makes me feel anxious, and I shan't be comfortable till it is in the hands of our master.'

'Well, we can get off at once,' assented Seppi, 'and then we shall get to Boissy before nightfall. I know a cheap and comfortable inn there; so the sooner we're off the better.'

Much pleased that his companion should agree so readily to leave Paris, Walter felt sorry that he had entertained any doubts of his character, even for a moment. Their simple preparations were speedily made, and half an hour afterwards they set out upon their return, and took the road to Boissy.

It was dark by the time they reached their destination; but as Seppi knew the village well, he had no difficulty in finding the inn, which was about ten minutes' walk from the high-road. The house was old and uncomfortable in its appearance, and produced a very unfavourable impres-

sion upon Walter; but the welcome they received from the landlord was so cordial, that the impression was at once removed. An old married couple and a young and powerfully built fellow seemed to be the only occupants of the large building. At Seppi's order a bottle of wine was brought, and Walter being somewhat fatigued with the journey, was easily persuaded to take more than his usual allowance. Overpowered with drowsiness, his head sunk down upon the table, and in a few seconds the unsuspecting youth was in a profound slumber.

'There's a snorer for you!' said Seppi to the man who had waited upon them. 'Lend me a hand to get him to bed, André.'

Whereupon they carried him up-stairs and along a passage to a small room at the farther end, and laid him on a bed just as he was. Having struck a light, André was about to leave the room, when he was detained by the other.

'Look here,' said Seppi, taking some money from his pocket. 'I am going away again to-morrow morning before daybreak, and may not be back until the day after. Here is payment for our supper and night's lodging. My friend will stay here, and you must not on any account allow him to go away till I come back. Give him anything he asks for; but keep an eye on him, for he is not right in his head, and must either have some one always with him, or be locked in his room. I can't take him with me in the morning, and so I have brought him here, where I know he will be in good hands. You will promise to attend to what I have told you, André?'

'Your instructions shall be attended to,' replied the other, slipping the gold coin which Seppi tendered him into his pocket. 'You shall have no reason to complain.'

'That's well. When I come back, you shall have another gold piece if I find everything right. And look here; only bolt the outer door to-night instead of locking it; or else leave the key in the lock, so that I can get away in the morning without waking anybody.'

The man promised to attend to that also, and quitted the apartment. When he was gone, Seppi bolted the room door, and gazed at his unconscious companion with a malicious scowl.

'Fool!' said he; 'I made you a fair offer when I proposed to go halves with the money; but as you were idiot enough to decline, so much the better for me. When you wake in the morning you'll be sorry you let the chance slip.'

Thus muttering to himself, he unbuckled the money-belt that was round the waist of the sleeping man, and fastened it securely round his own. He then abstracted Walter's passport and the other papers that were in his pockets without arousing him.

'He lies there like a dead dog,' thought the drover; 'and with the dose I gave him, is not likely to trouble any one till morning.'

Waiting impatiently for more than an hour until every one was in bed and the house silent, Seppi quitted the room on tiptoe, locked the door on the outside, and crept noiselessly along the passage and down the stairs. André had not forgotten to leave the outer door unlocked, and pushing back the bolt with the greatest caution, the ruffian slipped out, and as soon as he had got

clear of the village, hurried away at the top of his speed.

The Swiss drover had shewn great cunning in his scheme to get possession of the money from Walter, and he carried it out with equal boldness. He had often helped to drive cattle to Paris before, and knew the roads well. He had frequently been at the inn at Boissy, and its distance from Paris and the character of the man who attended to the business recommended it as well suited to his purpose. André, like many others of his kind, was greedy of money, and the golden bribe quieted all his doubts as to the truth of the story about his companion. Seppi on his side knowing that the sleeping powder which he had secretly mixed with Walter's wine was sufficient to prevent him waking for nearly a whole day, gave himself no further trouble as to what might happen in the way of pursuit. It was enough for him that his stratagem had been successful, and he hastened along the well-known by-paths until he had left Boissy far behind.

(To be concluded next month.)

FROGS AND TOADS IN STONE.

'At the works of Messrs Burton, brick and tile manufacturers, Ironbridge, Salop,' we were some time ago informed, 'some workmen were employed in sinking a well; when, on reaching a depth of twenty-two feet from the surface, they found a toad firmly imbedded in the solid clay. The reptile, which was a large one, appeared, when extricated from its living tomb, to be in quite a lively condition, and stretched itself out in the sun. It is alive, and preserved as a curiosity.'

This strange story is corroborated by many others of analogous character. Frogs and toads are really endowed with a power of bearing privation quite beyond that of most other animals with which we are acquainted. They have so little need of air for breathing, and so great an endowment of the power of dispensing with food for a lengthened period, that, as ascertained by actual experiment, they can survive for months or even years in closed cavities where the maintenance of vitality would seem well nigh incredible. In blocks of stone, in the solid trunks of trees, incased in a wall of cement or plaster allowed to solidify around them—in all these mysterious recesses it is said that they have been found alive. Blocks of solid stone have been quarried revealing living toads and frogs in the interior; and other blocks containing cavities apparently moulded around such animals—the denizens having somehow or other disappeared. If the rings in the trunk of a tree are a token and measure of its age, then a toad has occasionally been found imbedded in the layers which were formed generations ago, let it have got there how it may.

In order to place ourselves in some degree on a level with the subject, we will glance rapidly at some of the many accounts given of toads and frogs found in trees, stiff clay, coal, and stone.

A large toad was found a few years ago in an old apple-tree at Wonham Manor; it came to light when the tree was blown down. The *Mémoires* of the French Académie des Sciences contain a description of a living toad found in the heart of an old elm-tree. Near Nantes, when an

old oak was cleft open, a toad was found in the very heart-wood, although no crevice or other channel of entrance could be detected; there were about ninety rings in the trunk of this oak, leading to the inference (according to one theory) that the animal must have been in his prison-house ninety years. Mr Jesse, in reference to a frog found in the trunk of a mulberry-tree, expressed a belief that the annual rings had been gradually but surely inclosing the reptile.

Toads in clay have been more frequently met with than in trees; sometimes a whole family have been thus ferreted out at once. In 1856 a toad was found at a considerable depth at Benthall, near Brosely, Shropshire. Mr Bathurst, earthenware manufacturer at Benthall, ascertained that the creature was met with about six feet beneath the surface, in a layer of tough clay customarily used for making coarse brown ware. Above this layer, in successive strata, were ferruginous coal of poor quality, clay, a loam of clay and gravel, and meadow-turf at the top. The toad was found filling a cavity as wax does a seal. A minute examination of the superincumbent strata failed to detect any fissure through which the animal could have entered. The light of day seemed at first to distress it, but this it soon became accustomed to; the eyes were brilliant, the skin moist, the mouth quite closed.

Shale and coal are included among the abodes of these curious batrachians. At the International Exhibition of 1862, at South Kensington, a toad was exhibited in a bottle; and a block of coal with a cavity in its midst. The toad was said to have been taken from the cavity, and it may have been so; but there was a want of correspondence between the matrix and the seal, the convexity of the animal inclosed and the concavity of the substance inclosing it. In 1874 a miner in South Wales, while digging an underground passage, struck into a layer of shale at a depth of forty or fifty feet below the surface; a large frog leaped out, with its mouth closed, its eyes apparently sightless, its muscular power greatly weakened, and its breathing effected through the skin. How long the animal lived after restoration to the light of day, we are not told; but the miner, catching eagerly at some speculative remarks made by his semi-scientific neighbours, announced that he had discovered a frog which had lived five thousand years without food! Many pence were earned by exhibiting it as a wonder.

Brick walls, too, are sometimes the prison-houses of toads and frogs. At Easington Park, in Warwickshire, some repairs were being effected a few years ago, when a toad was found in a small cavity in a brick wall. As the wall was known to have been built in 1740, and as the discovery was made in 1860, had the creature been thus bricked up for a hundred and twenty years? It survived about six weeks after extrication.

Most of the narratives mention solid stone as the substance in which the incarcerated animals have been discovered. At Fountains Abbey in Yorkshire, the attendant who shews the wonders to visitors draws attention to a stone coffin, which, on being opened some years ago, was found to contain a living toad, supposed to have inhabited that gloomy residence for centuries. There is said to have been at one time a marble mantel-piece at the Duke of Devonshire's princely

residence of Chatsworth, with an impress of a toad, denoting that the animal must have been there when the marble was in a soft or plastic state. The workmen employed in breaking the nodules of ironstone which occur so abundantly in the iron-smelting districts and in many coal-mines, have more than once discovered toads alive within the nodules, and continuing to live for a short time afterwards. Strange, if true, seeing that these nodules are exceedingly hard. At the quarries of Combe Down in Somerset, when the men are excavating and dressing freestone and sawing some of the blocks, they occasionally bisect a toad and the cavity in which he is inclosed, without (as they say) being able to detect any fissure or opening through which the animal can have entered.

Many years ago, in working a slate-quarry near Barnard Castle, a toad of large size was discovered in a solid block—solid except the cavity occupied by the animal; the exhumed inmate died immediately on being exposed to the air. In Mackenzie and Ross's *Durham*, in which this incident is recorded, we are also told that, at Framwell Gate Bridge, Durham, when the old battlements were removed, a large living toad was descried in the middle of the wall, where it must (apparently) have been immured for ages, the bridge having been built as far back as the year 1120. At the Great Exhibition in 1851, two halves of a block of stone were shewn in which a living toad had been found; the creature died some time during the Exhibition. In the same year a toad was discovered alive within a mass of calcareous stone. It was sent to the Académie Française, by whom a Committee was appointed to examine into the phenomenon.

That mischievous fraud, or a tendency to make money out of other people's credulity, comes into play in some of the toad-in-a-hole stories, is likely enough. In a case which occurred in 1865, some members of the Manchester Geological Society instituted an examination of a piece of coal in which a live toad was said to have been found. They agreed that the cavity had been made artificially, and a toad put into it. The collier who exhibited the raree-show manifested much unwillingness to answer the close questions put to him—a pretty strong evidence that all was not fair and truthful. 'Flint Jacks' have doubtless their analogues in 'Toad Jacks.'

A better feeling than absolute incredulity is one that prompts men to search for a rational explanation of unexpected marvels; and such search has not been neglected in regard to our present subject. M. Duméril, the member of the Académie Française above adverted to, after examining a large number of recorded instances, came to the conclusion that the animal, when young and very small, creeps (or it may be falls) into a stone through a crevice or fissure too small to attract general notice; he feeds upon insects which he may have taken in with him, or dragged in from time to time; he grows rapidly, and becomes too bulky to emerge from the door by which he entered, and has to undergo involuntary imprisonment. Then comes into operation his remarkable power of living almost without food or air. When the stone is broken, as in a quarry, the cleavage is likely to follow the line of the fissure, and lays bare the

incarcerated batrachian—as naturalists call this order of reptiles. Toads, it is pretty well known, sleep all the winter, jumbled up together in a heap in any suitable cavity. The life of a toad in a stone may be merely a prolongation of his winter's nap. So profoundly does the animal sleep, that he may be, and has been, artificially frozen till quite hard and brittle, and yet vitality reasserts itself after slow thawing; this was proved by the distinguished French zoologist, Isidore Geoffroy Saint-Hilaire. Geologists now believe that millions of years must have passed since the first solidification of many kinds of hard stone in which frogs and toads have been found; the stone certainly did not harden around the intruders, and they must therefore have got into it somehow from without, in comparatively recent times.

One who had never seen such an animal in a stone or the trunk of a tree, and who disbelieved all the stories in that direction, sought for an explanation in the following curious fashion: 'The hollow of a horse's foot is called the *frog*; and the hollow or sinking on the face of a brick is in some parts of England also called a frog. When a hollow is found in a stone, might not the country workman have said: "There's a frog in the stone!"' Ingenious, but a failure, seeing that the creatures have unquestionably been found in stone, let their mode of admission have been what it may.

Some naturalists believe that the skin of a frog has the property of acting upon the atmosphere in such a way as to imitate in degree the action of the lungs, thus supplying the prisoner with a little air in a manner not available to less gifted animals.

There is something well worthy of notice in the following suggestion, put forward by a Scotch naturalist a few years ago. Chinks, crevices, holes, vacuities of various kinds are naturally formed in many stony strata and in many trunks of trees. The eggs of toads may accidentally be conveyed by water into these small openings; and after they are hatched, the animals may receive moisture and small portions of air from without.

Direct experiments have not been wholly wanting in connection with this subject. The *Zoological Journal* gives a detailed account of a series of experiments made about half a century ago by Dr Buckland, the eminent geologist. Obtaining a large block of oolitic limestone from a quarry near Oxford, he caused twelve circular cells or cavities to be made in it, each five inches in diameter by twelve inches deep, with a groove at the top to receive a plate-glass cover, and a slate to protect the glass. A block was also obtained of siliceous sandstone, and twelve cells scooped in it, equal in diameter to the others, but not so deep. Twenty-four toads of various ages and sizes were put into the cells, one in each; the cells were closely sealed up, and the blocks buried deep in the ground. When opened a year afterwards, it was found that nearly half the toads were still alive; inclosed for another twelve months, these survivors also died. About the same time Dr Buckland buried four toads deeply in cavities cut in the trunk of an apple-tree, and carefully closed the cavities with bungs of wood. In about a year's time, it was found that the reptiles were dead. M. Séguin, about 1850, placed several toads in an equal number of vessels, and inclosed them with plaster

of Paris. After an interval of several years, the vessels were opened, and one of the imprisoned toads was found still living, although the extremely hard cement had become exactly moulded on the animal, leaving no vacant space between them. On liberation, the creature crept out into the light of day.

Taking everything into consideration, our conclusion is that no animal can live without air and food beyond a comparatively short period. Gifted as are the batrachia with peculiar powers in this respect, toads and frogs may, and undoubtedly have been known to survive an incarceration of a few years. But here the matter ends. Dr Buckland's experiments must be considered conclusive that a year or two of solitary confinement deprives the toad even of its tenacious life. M. Duméril's arguments above cited, also dispose of the theories that would credit the poor creature with longer powers of endurance.

THE ROYAL ZULU.

A TALE FOUNDED ON FACT.

BENEATH the shade of a grove of palms, a Zulu maiden knelt in prayer on the morning of the fatal 22d of January 1879. Her face was pretty beyond most of her countrywomen; and her small hands and feet, her distinguishing ornaments and graceful form, bespoke her the daughter of some powerful chief. But strange, considering her nationality, were the words of supplication which flowed from her lips, as she raised her clasped hands to heaven. Not from witchcraft or enchantment, or from the equally powerless deities of her nation did she seek for help; but from Him only, the one true God, Jehovah.

'Father!' she cried, 'to whom all the ends of the earth look for help in trouble; hear me for the sake of Jesus. The evil spirit of war and persecution has come down, and entered my father's kraal; and Cetewayo has folded his hands and bowed his ear to listen. He has sworn to drink the blood of the white men, and eat up all the Christian Zulus of his nation. O Great Father! in this hour of trial, keep Cassatonga and me faithful to Thyself!'

The morning breezes rustled through the leaves, and the deep-fringed palms moved their stately boughs, as if in response to the prayer, while the sparkling brook which flowed hard by seemed to murmur a low 'Amen!'

At this moment, a movement beside her caused the worshipper to turn round; and she beheld a stately warrior standing near her, leaning on his black shield. His eyes were fixed with unspeakable love on the youthful form before him. 'Luola,' he said, 'your prayer for me is answered; I can fight no more for Cetewayo. Last night, the murder, indescribable in cruelty, of Sirayo's wives for their adherence to the Christian faith, proves what little mercy the king would shew towards any one, even yourself, were you to oppose his will; and though it is our duty to bear persecution when it comes, it is no doubt equally madness to provoke it. Here we can no longer stay without declaring our faith, and therefore we must fly with all haste to Helpmakaar. You know the good missionary there, the same who taught us the will of the Great Master, and beneath

his care you will be safe from your father's wrath. This alternative is the only one left to us, and I feel it is the right one. Will you come now, Luola? My horse stands ready in the thicket.'

'I will.' And though the hand extended to him trembled, the voice was steady that decided their fate.

'By Rorke's Drift is our shortest road,' he said, as they reached the tree where his horse was fastened; and placing the princess on its back, he mounted behind her, and turned his steed in the direction of the Buffalo. They travelled for some hours with extreme caution, skirting every kraal and open ground, till at length they arrived at a large thickly planted wood, in which they hoped to find an hour's repose. But they had scarcely dismounted ere the roar of artillery and the cracking of rifles, mingled with wild yells, were heard in the distance; and Cassatonga hastened to conceal his royal charge before endeavouring to discover the cause. Hiding Luola and his horse in the densest part of the grove around him, he selected a lofty tree, whose thick branches would be a shield in themselves. Climbing with the agility of his nation to the topmost boughs, he beheld the fatal field of Isandula spread out before him. Amazement at the unexpected sight and deep admiring pity flashed in his eyes as he looked on the tiny band of white men who shoulder to shoulder received unflinchingly the masses of his countrymen, as like their own mountain torrents, they swept down upon them.

The first emotion of his heart was to fly to the aid of the devoted column; but the thought of his bride restrained him, and he sank back among the sheltering leaves. Straining his sight over the awful plain, he could distinguish his own fierce regiment, although foremost in the work of death, yet not so preoccupied therewith as to be unconscious of the plunder which lay around, pausing even in their butchery to collect cattle, stores, and wagons to be driven to their distant kraals. Horror and disgust filled his now enlightened soul. 'Why do those English soldiers stand there,' he asked himself, as the breath came quickly through his labouring chest, 'on that plain of Africa, far away from their island homes, to be shot down, steady in their matchless ranks, by their swarthy foes?' His own heart gave him the reply: 'To save helpless women from the savage butchery he beheld last night; to guard the gray hairs of old age from going down to a terrible grave beneath the real or feigned imputations of witchcraft and divination; and above all, to teach the pure faith of the Gospel where reigned the degrading demonology of his native land.' His dark eyes blazed, and his pulses throbbed as these thoughts surged through his mind; and he pressed his hands over his aching eyeballs as he bowed himself to the service of that flag which shelters Freedom and Truth beneath its folds.

But meanwhile the work of death went on. Those who were sent for help to Rorke's Drift were, alas! shot or assailed; few, *how* few, reached the river, and Cassatonga beheld with dismay that the Zulus were scattering towards the Drift. Could he skirt the wood and reach the ford before them with his precious charge? was now his anxious thought. Descending quickly

from his position, he found the trembling Luola terrified at his long absence. He described the awful scene he had just witnessed, and told her of the immediate necessity for endeavouring to cross the river.

The blood of the lion-like founder of her dynasty flowed in Luola's veins, and though convinced of imminent danger, she was not wanting in courage. 'Let us go,' she said; 'God will help us, and be our shield.'

Remounting, they rode on till they came to the edge of the wood, when a new danger menaced them, which tested to the utmost the fleetness of their steed. Barely out of range of rifle-shot, some scattered parties of Zulus were coming towards them. Cassatonga knew well he could give no reason for not being with his troops, and the daughter of their king was not unknown. Were she seized and conducted back to her father, he dared not think of her fate. Urging his horse to a gallop, he cleared the wood, and by carefully placing every hill and clump of bushes between him and the savages, he succeeded in making several miles undiscovered.

But just as he and Luola were beginning to hope they might escape unnoticed, a yell in the distance told that they were seen. Now was the hour of trial for horse and riders. The noble animal seemed hardly to touch the ground as he flew along the plain, the wild yells of the Zulus ringing behind. At length the banks of the Buffalo rose high before them, and Cassatonga realised with horror that he had not time to look for the ford, and must only trust his nearly exhausted companion and breathless horse to the perils of a plunge from those lofty banks. But it was their last hope of safety; they must do it or die. At length they reached the bank, which rose full six feet above the stream. Cassatonga held the princess tightly in his arms, and the horse's nostrils dilated and his eyes shot fire as he gazed on the torrent beneath. But not a second did the noble animal waver; obedient to his master's hand he bounded from the bank, and in another minute tossed his noble head above the wave as he bravely breasted the stream. In a few moments, however, his feet touched the bottom; the ford was found, and the worst of the terrible strain was over. At length they gained the opposite bank, up which the weary horse toiled slowly; and soon, to his rider's great astonishment, the small English camp lay before them.

The pair now paused to consult about their next move. The Zulus, they justly conjectured, would make no delay in crossing the river, and their poor horse was far too exhausted to carry them that night to Helpmakaar; therefore they unhesitatingly felt their wisest course would be to place themselves under the protection of the English commander. Tying a white handkerchief to the end of his spear, Cassatonga approached the camp; and when within earshot, he called out in a loud voice to the sentries, informing them that they were Christian Zulus flying for safety. They were immediately seized, and brought before the officer in charge, who received them with much suspicion, as he had only just heard of the disaster at Isandula, and was in no mood to harbour Zulus of any kind. Their tale was soon told. But though the officer suppressed his pity for the sufferings of the royal maid, he gave orders to

have them strictly watched, at the same time commanding that their wants should be supplied.

It is needless to give a description of the night that followed. All the world knows how through the darkness the tide of battle surged up, wave after wave, against the weak barriers of the little fort, and was again and again repulsed. All the world has rung with the names of Bromhead and Chard, and all the other heroes who with strong hands and stronger hearts held the fort that night. But among them all who fought beneath the red-cross flag there was no stronger arm, no braver heart than his, the young Zulu chief, who had renounced friends, fortune, country, to enlist beneath the banner of a higher Cross, and strive henceforth for a more enduring victory. As the morning broke upon the scene, and disclosed the dusky foe, disheartened and defeated, vanishing like dark clouds behind the distant hills, the gallant officer, begrimed with powder, seized the now scarcely darker hand of the noble Zulu, and thanked him as a British soldier for his timely aid. Luola felt in that moment she was rewarded for all the terrors of the night.

After some hours' needful rest at the fort, the young travellers prepared to resume their journey. They were followed by the benedictions of all. Luola had been untiring in her assistance to the wounded; and the dying were cheered by her words of comfort. Thus amidst many good wishes, they bade farewell to their new friends, and accompanied by the officers bearing despatches, they set out for Helpmakaar. The evening shadows were lengthening as they entered and rode through the streets of that town; and soon they were received with warm welcomes beneath the roof of the good missionary.

Not long afterwards, before these officers returned to their posts, they were called upon to witness the union of their Zulu comrade with his royal bride. The ceremony was performed by their friend, Mr B——, in the words of the beautiful service of the English Church. And here let us leave them. They have set themselves resolutely to the task of preparing for that labour of love which they feel certain God will in His own good time open up for them—a wide field of missionary work in their dear native land. Be it ours to pray for the success of all such noble hearts; and for the time when the swords of all the world shall be beaten into pruning-hooks, and the nations study war no more!

IDLE LETTER-WRITING.

OBVIOUSLY, from the penny post and other causes, letter-writing has become a prevalent amusement, particularly among ladies with a disposition to communicate family gossip. It is no exaggeration to say that many young persons consume as much time in mere tittle-tattle letter-writing as, say in the course of a year, might enable them to acquire a fair knowledge of some modern language, or familiarity with many standard works in their own. And here it may be said parenthetically that the young of the present day are often, without any precise fault of their own, lamentably ignorant of many of the great master-pieces in English literature—those works that as long as our language lasts, cannot fail to enrich the minds that feed upon them. New subjects, however, are

always arising, and new books are always appearing to draw attention from the old ones.

But the limitation of more profitable employment which what may be called idle letter-writing occasions, is not the only evil which results from it. One silly frivolous letter is likely to engender another in return; and when mere gossip and tittle-tattle flow from the pen, they are apt to become more mischievous even than when spoken. Many people are exceedingly careless in respect to letters. The rule ought to be—unless there is some special reason to the contrary—to destroy private confidential letters as soon as their contents are mastered. All sorts of accidents happen from their preservation. We heard only the other day of a bundle of letters being discovered which ought to have been consigned to the flames forty years ago. Very likely some of them will get into 'the autograph market,' for many were from distinguished men. Put together, they revealed a sad history, the publication of which could only give pain to friends and relatives of the brave soldier whom they concerned. They were found in a valise left behind him in lodgings he had occupied, the rent of which he could not pay. Years passed before the landlady opened the little receptacle. Not till she had completely failed to trace her lodger, and till she believed him dead, did she force the lock.

Accidents of this sort happen more frequently than is supposed, and they ought to put both letter writers and receivers on their guard. Also young people should bear in mind that their opinions of people and things may very likely change as they advance in life, and that except in cases of clear right and wrong, it might be wise to abstain from unkind remarks and strong censure in their correspondence. A poet says, 'A deed can never die,' and written words have sometimes a disastrous vitality.

Most persons who have a considerable correspondence must, we think, have felt that among their friends and acquaintances there are two special sorts of letter-writers—those whose letters give pleasure, and those whose pages rarely fail to have some phrase or some omission which gives pain. With the first class the mere sight of the handwriting is a gratification; we know that it will never sting. Even if there be bad news to tell, it will be softened by sympathy; and if the tidings be joyful, the joy will seem doubled by participation. With the other class the case is precisely opposite. A piece of good news is told in a dry don't-care manner, or a painful subject is discussed as from some vantage-ground of implied superiority. If the letter be on more level topics, then there are probably sarcastic remarks in opposition to the receiver's known opinions. We are inclined to think that the secret of writing pleasant letters is to think more of the receiver than ourselves when in the act of writing—to put ourselves if possible on the plane of his or her feelings.

Certainly the three persons whom the writer has in mind as having had the trick of writing disagreeable letters were all great egotists, largely endowed with what phrenologists consider the organ of self-esteem. They were not unaffectionate; but they seemed slow to understand emotions they had not personally experienced, and 'shafts' of the pen 'at random sent' often

wounded bitterly. Such letter-writers would do well to remember one fact, and that is, that we never know under what circumstances a letter may be received. A hard, unkind, or unsatisfactory letter may cause but a passing regret if the recipient be well and happy; but the case is far different if it arrives in the season of sickness or sorrow. When a cup is brimming, another drop will make it overflow; and when the heart is filled with anguish, there is subtle cruelty in adding to its burden. The pen can lacerate as well as the sword, and its wounds are often the more incurable of the two.

Then again few of us are so good and wise as never to have written an angry letter, despatching it in haste, instead of waiting for bitter feelings to cool, and a few hours afterwards mournfully regretting some too harsh expression. No doubt writing the letter was an immense relief—perhaps even it was an outlet by which our wrath could evaporate; only it would have been better if it had been thrown into the fire instead of the letter-box. If it be well, as the ancient philosopher said, to count a hundred before speaking the angry word, it is well to count a thousand before writing it.

It is, as we have previously hinted in this *Journal*, perhaps one of the most useful of modern accomplishments to be able to write a really good letter, one that, however short, is clear and explicit, and to the point of whatever may be under discussion. With some persons, the habit is acquired early and easily; with others it requires much practice and painstaking before it is in any degree established. It is well, we think, for young people hardly yet out of childhood to be indulged in undictated, unrestrained letter-scribbling, if they have any taste that way. They will gain early a certain experience of what it is wise and what unwise to do with regard to letter-writing, without paying very dearly for it. The experience bought at fifteen costs so much less than it does at five-and-twenty!

CURIOUS CASES OF SOMNAMBULISM.

THAT persons walk in their sleep and are unconscious of ordinary impressions, but yet retain sensations, there is, we all admit, no doubt. One curious instance occurred in a school-girl who was observed to rise every night about midnight and walk about her bedroom and the lobby outside her sleeping apartment. After some time, on returning to her bed she was in the habit of examining it and all about it, and finally selecting for some hours' rest a clothes-basket which the housemaid kept on the flat roof of the cradle-bed in which she lay. After carefully examining the clothes-basket, she climbed up on the head of the cradle-bed, and circling her body as a cat would above the clothes in the basket, she composed herself to sleep, in which she remained for an hour or more, then rose, and returned to her bed. In the morning she awoke at her usual time, having no consciousness of what had occurred during the night. Her sister watched her proceedings, but never interrupted or awakened her, and after some time the nocturnal climbings ceased.

The second case that came under my observa-

tion was more varied and more embarrassing. A young lady at school became a somnambulist. She rose from bed and walked in her sleep. The ladies who conducted the school became alarmed, partly on the girl's account, and partly for the character of the school, as it might injure their establishment were it known that the young ladies practised the habit of walking about the lawn in their night-dresses, in the moonlight. They had an impression that if the girl were suddenly awakened, death or immediate deprivation of sense might be the result; and this led to the attendance of two maid-servants, who were strictly enjoined to follow the footsteps of the somnambulist, to watch that no mishap should occur to her, and to have all doors opened, and the way kept clear for the return of the sleeping pedestrian. This continued for some time. But at length the somnambulist's fancy took a more adventurous turn. Slaters had come to work on the roof of the house, and the sleeping peripatetic evinced a desire to star-gaze. Accordingly, on the next night she turned to the slaters' ladder, and to the horror of her attendants, ascended it, mounted to the roof, and walked along the gutter, with a sloping roof on one side and a low parapet wall on the other. The attendants now became almost frightened out of their wits, and knew not what to do or think. They feared to call out; for return to consciousness in such a place would almost inevitably lead to her stumbling on the roof or falling over the parapet. Their terror was, however, not yet at its height. The somnambulist came to a slight obstruction in the gutter; she paused for a moment, and then, without hesitation, stepped upon the parapet, and continued her walk on the narrow stone coping. A single slip, a false step, would have precipitated her from a height of thirty or forty feet; yet to awaken her would almost certainly have led to the same catastrophe. The sleeping girl continued her walk to the end of the coping, and then turning round, resumed her walk to the dormer window, descended the ladder, reached her bedroom in safety, and lay down in her bed; awaking in the morning quite unconscious of her midnight danger and of her narrow escape.

I was then a very young practitioner in medicine, and was, up to this period, although the medical attendant of the establishment for ordinary cases of illness, not consulted on this perplexing case, as it was naturally desired to keep it concealed; but after the stroll on the parapet wall, and the terror created by it, it was thought that, with the object of preventing a recurrence of a night-walk that might end in some terrible accident, the young lady should be consigned to temporary residence in a private asylum, where there would be always both a night and a day watch. I was taken into consultation next morning, and earnestly discussed the gravity of taking such a step. It would be impossible to keep it secret, and even were it possible, in her waking hours she would look with horror on the coming night, when she should be sent to bed in a strait-waistcoat. In after-years too, when perhaps she might have a young family around her, the thought might arise that she had once been an inmate of such an institution; and the reminiscence would make her miserable. I duly considered all this, and suggested various expedients, such as sedatives, sleeping-draughts, and network to be put round the

bed at night. All, however, had been tried in this instance, and all in vain.

I then thought for a little, and hit upon the following plan. I directed her night-dress to be sewed up at the foot, so that it formed a large bag, and then I had the sleeves lengthened so much that each sleeve, after going round the body, reached the front, where it met the other sleeve, and was securely fastened to it. The whole dress was loose; but the long sleeves prevented the hands from being used to get rid of the dress; while, from the end being sewed up, the feet could not be used in progression. At the same time the dress freely permitted the sleeper to roll about from side to side in her slumber; and thus it differed from the hideous strait-waistcoat then in vogue. Night came, and our charge retired to bed in her new-fangled night-dress, with which she was amused. The usual hour for the night-walk came. Her attendants were strictly enjoined not to stir. She raised herself as usual in the sitting posture, then stood upright, and commenced to walk. The second step was a trip, for the foot behind held the bottom of the bag in which she stood. She stumbled, fell forward, and awoke, and was put back into bed, where she soon fell asleep. Next morning there were no bad consequences except that her face was slightly bruised by the fall. I recommended a continuance of the sleeping-chemise for a short time, as a cautionary measure. And now came a curious change in the phases of the affliction. She would still rise from bed each night, but made no further attempt to walk as before. She would stand erect, and keeping the knees perfectly rigid, spring straight upward from the floor, and thus dance about the room in what was years afterwards known as a popular music-hall dance under the name of the 'Perfect Cure.' This she would continue until thoroughly fatigued, and then retire quietly to bed and to sleep. I am glad to add the case did end truly in a perfect cure without the intervention of strait-waistcoat or private asylum.

This strange state is generally called somnambulism. It is really alternating identity, in which the ordinary state of mind is suspended, and another identity—I do not know what else to call it—takes possession of the individual, and like warp and weft, alternates without mixing, the warp presenting continuity at one time, and the weft the same at another. One of these alternations occurs most often in sleep, when the ordinary mental power is no longer governing, and hence the attack is called somnambulism. The somnambulist will weave the somnambulism of one night with that of the preceding into a continuous warp or weft, and so with the ordinary mental power; and thus the two identities alternate, but do not mix. This alternating identity will, however, occasionally force itself into the waking hours, and thus the two identities divide the unhappy being between them.

A young lady under my observation exhibited an instance of this. For some time a somnambulist, the alternating identity at length became strong enough to intrude upon her waking hours. Her ordinary perceptive and voluntary powers would be suddenly arrested during the day, and whether at music or work—no matter how employed—the interruption was sudden and instantaneous. If at

the piano or harp, voluntary movement ceased at the moment; if walking across the floor, she remained in the position in which she was when it occurred, and remained thus for a longer or shorter time. She would sit at dinner apparently as cheerful and as collected as any one at the table. At the time of which I speak it was customary for guests to take wine 'with one another. A gentleman would ask her to take wine. She bowed her head as was usual; and in raising the glass to her mouth, there suddenly passed over her face and figure a slight but indescribable shudder. She immediately lost all knowledge of those about her, and would address them with names quite foreign to them. This state would continue for two days, until at dinner on the third day she would turn to her relative and say in her natural tone: 'Did you not ask me to take wine?' Her natural state then returned; but those alternations became more frequent and more painful, until at length the unfortunate girl was deprived of the society of all but her nearest relatives.

[Cases of sleep-walking are by no means unfrequent, and the habit sometimes runs in families. In a family with which we are connected, the children, while young, were all more or less addicted to sleep-walking. One of the younger branches, a girl of fifteen, on one occasion rose from her bed, and walking down-stairs, entered the drawing-room, where were assembled a few guests. Fortunately the girl's habit was known to most of the company, who, instead of evincing a horror of the unwonted visitor, treated the matter in a philosophic spirit, and even maintained their usual conversation, as the girl's father took her hand and led her quietly up-stairs to bed. Had the somnambulist been rudely awakened, the consequences might have been serious; and the calm demeanour of the spectators and judicious management of the girl's parent on the occasion we have related, may perhaps act as a hint to others who may be similarly situated. Never awake a sleep-walker if it can possibly be avoided.—Ed.]

ECCENTRIC INVITATIONS.

A FAMOUS philosopher was wont, if we remember aright, to so couch his invitations that those who came to his perfect little dinners were aware beforehand what would be set on the table for their delectation, and at what hour they were expected to take their departure. It was the custom of Marshal Vaillant when Minister of War, to ask the officer on guard for the day to take dinner with him; not by word of mouth or by a polite note, but by a notice in his own handwriting posted up in the guard-room, and invariably running thus: 'Art. 1. The officer on guard is invited to dine at the table of the War Minister. Art. 2. The officer on guard is received by the War Minister, who after shaking hands with him, presents him to the Marshal and the guests. Art. 3. The Marshal always offers his arm to the officer on guard to conduct him to the dining-room. No matter what guests may be present, his place on the left of the Marshal is kept. Art. 4. Avoid offering wine to the Marshal, who only drinks water. Art. 5. On leaving table and going into the smoking-room, accept the cigar

which the Marshal always offers. Art. 6. At the end of half an hour, the Marshal always asks the officer on guard to play a game of whist, which he should refuse, saying that it is his duty to return to his post. He ought therefore to salute the Marshal, and then retire.' Given his choice in the matter, probably the guest would rather have dined with his brother-officers than with the martinet minister.

A host of another sort was George Colman. When the Drury Lane manager sent him a play for revision, he wrote: 'DEAR BUNN—Pray dine with me to-day at half-past five, but come at four; we shall then have time to cut the play before we cut the mutton.' It was no unusual thing with him to put his invitations in rhyme, on one occasion parodying Macheath thus neatly:

'The dinner's prepared, the party is met,
The dishes all ranged, not one is for show.
Then come undismayed, your visit's a debt—
A debt on demand—we won't take a "No."
You'll fare well, good sir, you can't fear a dew,
Contented you'll sleep, 'twill be better for you;
And sleeping you know is the rest of our lives,
And this way we'll try to please both our wives.

Come to Richmond to-morrow to dinner, or you
have lost your Kew for pleasing everybody.—
G. C.'

When Charles Mathews was playing at Bristol, the Duke of Beaufort invited him to pay a visit to Badminton, stating, by way of extra inducement, that two billiard-loving judges were among his guests. Unable to take advantage of the tempting offer, the witty actor replied: 'I regret extremely that my engagements prevent my accepting your Grace's kind invitation, for nothing would have given me greater pleasure than to have taken the lives of two judges at pool.' With much more alacrity did a certain man of letters, travelling in the United States, respond to a literary lady's invitation 'to meet some minds at tea' at her house, by expressing his sorrow at being prevented from doing so through having already promised to meet some stomachs at dinner. Whether his excuse shocked American modesty, we do not know; he would have been set down as a very rude man by the English farmer's daughter who, in acknowledging a feminine friend's invitation to go with her to the races, wrote on behalf of herself and sister: 'The energy of the races prompts me to assure you that my request is forbidden, the idea of which I had awkwardly nourished, notwithstanding my propensity to reserve. Mr T. will be there. Let me with confidence assure you that him and brothers will be very happy to meet you and brothers. We girls cannot go for reasons. The attention of the cows claims our assistance in the evening.'

One reason sufficed to account for Lord Fife's non-appearance at a dinner-party at Lady Cork's, to which that lively old lady had asked him, in order that he might meet a newly married dame of whom he had once been an ardent admirer. Instead of receiving the impecunious nobleman, the hostess received a note, which soon went the round of the company. It ran as follows: 'MY DEAR LADY CORK—I cannot express my regret that it is quite out of my power to dine with you. And you will pity me when you hear that I am in bed. A rascally creditor has had everything I

possess taken from me. I must remain in bed till my lawyer comes, as I have not a coat to put on. This is the reason, dear Lady Cork, I cannot dine with you.'

Before accepting an invitation, it is as well to be sure it is given in good faith. After an afternoon service held many years ago in a certain village in Scotland, the preacher, a stranger, who had officiated, accompanied one of the elders of the congregation home, and was introduced to his wife. The good-man having asked the clergyman to stay to dinner, the latter after a little pressing, consented. The good-lady hurried off to prepare for the unexpected guest, and seeing, as she thought, her husband washing, as was the custom in these days, at the kitchen sink, she seized the family Bible, and approaching stealthily from behind, brought down the ponderous tome upon his bald pate, exclaiming: 'Tak ye *that* for bringing hungry preachers here to dinner every time they come to the parish!' As soon as the assaulted one could get the suds out of his eyes, he looked about him, and after thinking the matter out, concluded that the old lady had made a slight mistake. She too came to the same conclusion when, upon returning to the parlour, she beheld her husband patiently waiting for his reverend friend!

THE MONTH.

SCIENCE AND ARTS.

It is a familiar fact that oxide of iron and sulphide of iron, or iron pyrites, are among the most plentiful of minerals; the element iron having been in the one case mineralised by oxygen, in the other by sulphur. It is known also that the sulphides are combustible; and taking advantage of this characteristic, Mr Hollway has devised a method of utilising sulphides as sources of heat in metallurgical operations. It seems impossible that a metal should smelt itself; but Mr Hollway's paper, read last session at the Society of Arts, clearly proves that this is what he proposes. He has shewn by experiments in a Bessemer converter that his theory is sound; but for complete success in practice, a special kind of furnace and smelting-works will be necessary. A furnace that can be heated without coal will be a surprising spectacle, and may be always at work, so abundant are the supplies of the peculiar fuel. 'The largest deposits of coal,' says Mr Hollway, 'existing in various parts of the world are, perhaps, more than rivalled as sources of latent heat by the natural sulphides, abundant in every country, occurring in almost every vein, constituting in fact a material portion of the earth's crust.' At the Rio Tinto mines in Spain, from one and a half to two million tons of pyrites are dug out every year. In the slow roasting, lasting some months, to which it is afterwards subject, great part of the sulphur and metals which it contains is wasted. Mr Hollway's process, on the other hand, by driving a stream of air (oxygen) through the mass effects the separation in a few minutes. He starts his furnace with ignited coke, feeds in the material to be smelted, turns on the

blast; and an intense heat may be maintained for weeks without addition of coke or coal. But coal is required for the steam-engine which creates the blast.

The furnace would be so constructed as to arrest the volatile substances that in ordinary circumstances fly off as vapour. These substances include arsenious sulphide, lead sulphide, oxide of zinc, and sulphide of thallium. And here we are informed that 'three hundred thousand tons of pyrites would produce seventy-two thousand tons of crude sulphur, and one hundred and twenty thousand tons of sulphurous acid;' and these are products which can always be sold at a profit. Another advantage of Mr Hollway's process is that it is not noxious, as the process is at the copper-works near Swansea and at the Rio Tinto works, where the vegetation of the neighbourhood is poisoned and destroyed by the deadly fumes.

The chemist of the Geological Survey of Pennsylvania, after an examination of the coals of that State, reports that some of them contain large quantities of phosphorus, which accounts for the failure of attempts to convert pig-iron into steel. Pure fuel, he remarks, 'is as much a necessity as pure ores, though hitherto iron-men have paid comparatively little attention to this point.'

At a meeting of the Manchester Geological Society, Mr W. E. Garforth gave an account of a method of blasting coal in mines by means of compressed air, whereby the risk attending the use of gunpowder is obviated. With a portable machine of simple construction, which can be worked by two men, he gets a pressure of more than fourteen thousand pounds to the square inch. The cartridge, an iron tube, is drilled into the coal; the pipe from the compressor is connected, the air is forced in, and, in the experiments hitherto made, the cartridge bursts, and the coal falls before a pressure of ten thousand pounds to the inch is reached. When coal is brought down by firing a charge of gunpowder, half an hour or more is wasted while the smoke drifts away from the working, before the miners can resume their labour; whereas the sudden expansion of the compressed air may be regarded as beneficial. To obviate the objection that the labour of working the compressor in the heated air of a mine would be exhausting, Mr Garforth proposes to fill receivers with compressed air above ground, or at the foot of the shaft, then transport them to the several workings, and there burst the cartridges by liberating the imprisoned air. It is said that this method is more expensive than blasting by gunpowder; but there is much in its favour; and considering the appalling loss of life of late years in coal-mines, the government Commission appointed last session to inquire into the subject will in all probability recommend that the use of gunpowder should be forbidden.

'The Showspeed,' an instrument invented by Mr J. M. Napier of Lambeth, offers an advantage to all employers of machinery in motion. A

circular cup is mounted on a spindle so constructed that it may be put into connection with a machine, an engine, or a moving body of any kind. A glass tube, after the manner of a barometer tube, rises from the cup; a given quantity of mercury is poured in; and when the cup rotates, the mercury rises in the tube, and by means of a float indicates the speed of the machine, the carriage, or the locomotive to which the Showspeed is for the time attached. The float rises and falls with every variation. Similarly the rate of motion of a current, a river, or of a waterfall may be measured, and read off at a glance, if the scale be suitably inscribed.

Rockets of different kinds to be used as signals have been tried at Woolwich with satisfactory results. The distress signal is fired from a socket fixed to the deck or bulwarks of a ship; it rises to a height of six hundred feet, then bursts with a bright light, which can be seen at seven miles' distance, and a report loud enough to be heard at thirteen miles. The advantage of this rocket over the usual signal of distress—firing a gun, is obvious; and further, it can be fired by means of a lanyard and friction tube, no light or match being necessary. Of another kind is the sound signal intended as a warning to ships where there is risk of collision; and another is a sound signal for use on shore in darkness or in foggy weather. Now that such efficient signals are provided, let us hope that vigilance and readiness on the part of those for whom they are designed will not be lacking.

Ballooning will henceforth form a part of the art of war, for, by order of the War Office, a balloon equipment has been placed in the Royal Arsenal, Woolwich. Two balloons for experimental purposes, and a portable furnace for the manufacture of hydrogen gas, are in commission; and a party of men and officers of the Royal Engineers have been instructed in aerostatics, and in the preparation of network and other appliances required in actual service. Among these is a kind of rope not more than half an inch thick, but of such strength that it will bear a strain of three tons, which may be expected to do good work with the grappling-irons. The balloons and all the appurtenances have been made within the Arsenal, so that ample supplies can be produced as required in working out the important aeronautical question. That balloons may be employed with great advantage in war, has already been demonstrated. To look down into an enemy's camp, or to spy out his movements behind a ridge or in the rear of a wood, may tend to the defeat of his plans and the shortening of a campaign; and this may be done by means of a captive balloon. But very much more might be done if a free balloon could be made to sail in any direction; and this is the problem which the Royal Engineers and the Aeronautical Society have now to work out.

The Registrar-general in taking leave of office

in a farewell Report, states concerning marriages, that in addition to all those persons married in churches, there are sixty thousand each year married in chapels, and forty thousand in registry offices. Before 1838, the only documents recognised as attempting the date of birth were the parish registers of baptism kept by ministers of the established church, but they furnished no real proof of the exact age of the infants whose baptisms were recorded. But during the last forty years the actual date of birth has been registered together with full particulars as to parents and locality; and about nine hundred thousand of these births are annually recorded. A similar practice prevails as regards deaths, for the entry in the Civil Register includes the place and cause of death, the exact names, occupation, and age of the deceased; and more than five hundred thousand of these deaths are registered every year. Accuracy is so important, that the records are protected by law, attempts to falsify them being punishable by imprisonment. These are improvements on which the Registrar-general looks back with satisfaction; and he acknowledges his obligations to the registration officers who so long furnished him periodically, and with 'marvellous punctuality,' with the returns which enabled him to publish his weekly and quarterly Reports—'returns for which they receive no remuneration.'

Further, the Registrar tells us that London proper contains three-and-a-half million inhabitants, or, including the outer ring of the suburbs, four-and-a-half millions; a number equal to the aggregate population of Berlin, Paris, St Petersburg, and Vienna. The area of this great city is one hundred and twenty-two square miles, with twenty-nine thousand three hundred and twenty-two people to the square mile; and the fact that with so dense a population the general health is so good, may be accepted as evidence that the sanitary arrangements of the great city are not badly cared for.

The beneficial effects of salicylic acid as a medicine have been much discussed in the medical journals since 1875, when the acid was first administered as a remedy for rheumatism. Its antiseptic properties render it useful in eruptive diseases, in diphtheria; and it has the further advantage when properly made, of being colourless and tasteless. It kills bacteria and other animalcules, and destroys the unpleasant odour of wounds. Professor Kolbe of Leipzig, in his many experiments with the acid, found that rain or river water containing one-twenty-thousandth of a grain thereof would keep sweet in a warm room four weeks or more, while similar water not so treated soon became unpleasant to the taste. This was confirmed by an experiment on a large scale; water charged with one gramme of salicylic acid to twenty litres was placed on board ship for a year's voyage; and was found sweet and free from organic matter when at the end the casks were opened. Milk treated with the acid remains sweet more than a day longer than without it. Eggs after a bath of the acidified water, keep sweet for months in a dry place; and meat sprinkled with the powdered acid and packed in a jar acquires no unpleasant odour. Wine may be kept from turning sour by the use of the acid;

brewers find it useful in some of their processes; and its property of preventing putrefaction is turned to account in the making of glue and other manufactures.

In the Transactions of the Pennsylvania Medical Society, Dr J. T. Carpenter endeavours to prove that constitutional diseases have a local origin. He thinks that 'small-pox is a bilious' fever, and that the liver is the starting-point of that disease as well as of yellow-fever.

There are two classes of insects which make a buzzing when they fly—those known to entomologists as *Diptera* and *Hymenoptera*. How is the buzzing produced? is a question that has been often asked. A French naturalist has answered it in a paper presented to the Academy of Sciences at Paris. The buzz combines a deep and a sharp sound. The deep sound proceeds from the wing, provided that the vibrations are sufficiently rapid. The sharp sound, usually an octave above the other, is produced within the thorax, as has been ascertained by experiment. A supposition prevailed that it was due to the passage of the air through the stigmata and the vibration of their valvules; but these openings have been stopped with bird-lime, and yet the sharp sound continues. It keeps on even when the wings are cut off. The explanation is, that the insect still endeavours to fly, and employing the wing muscles, occasions vibrations of the thorax, and thereby produces the sharp sound, more or less intense, according to the size of the insect.

Mr Clairefond, a Frenchman, has published a small book, the title of which translated is *A New Application of the A, B, C, or a Physiological Study on the Origin of Language*. He revives the argument that the earliest attempts at human speech were imitations of natural sounds or the cries of animals; and he contends that out of recollections and repetitions of those sounds the names of certain natural phenomena, and of animals and other objects, originated. He finds numerous examples in the French language, and thinks that proofs might be found in other languages if search were made, and suggests that the Geographical Society of Paris might furnish instructions to their travellers to collect from among the natives of different countries all the sounds traceable to the source indicated above. Mr Clairefond is of opinion that the series of sounds, words, and expressions thus collected would aid in the discovery of the origin of language. Taken in connection with natural sounds, the origin of words in our own language—such as thunder, sigh, whisper—becomes evident.

Dr Oppert, Professor of Sanskrit at Madras, has published a learned book *On the Classification of Languages: a contribution to Comparative Philology*. After giving a sketch of the history of philology, the author divides languages into concrete and abstract; and corroborates this distinction by the absence and presence in these two classes of grammatical gender. The further subdivision, as he remarks, 'into heterologous and homologous concrete languages, and into digeneous and trigeneous abstract languages, is a logical outcome of the adopted system.' Instead of seeking examples in a 'few privileged groups of languages,' the Doctor prints tables which contain instances of 'more than a thousand varieties of speech.'

Architectural Foliage is the title of an instruc-

tive and suggestive paper read before the Institute of British Architects by Mr Colling, who endeavours therein to lay down true principles of decoration. Too often foliage and flowers are simply stuck upon a building without any regard to fitness, and consequently to the detriment of architecture. 'In all early forms of art,' he remarks, 'we find plain surfaces invariably used for the development of painting or sculpture. In the Egyptian and Assyrian, walls were made eloquent by hieroglyphics and sculpture embracing animal and vegetable forms. In the Indian, Persian, Moresque, and the Arabian, we observe that the same principle was adopted, and that the buildings and other works of those nations were literally covered with elegant combinations of foliated form, and plain moulded work is scarcely to be found. Yet all these elaborate enrichments were not added to or upon the works, but were taken out of them, and therefore did not destroy their breadth or character.' Those four words 'taken out of them,' deserve especial consideration; they embody the art and mystery of architectural decoration. Ornament when not spontaneous is a disfigurement. If architects will bear this fact in mind, and avoid copying nature in a purposeless way, but by patient study and observation arrive at a knowledge of 'her variety of form, of her regularity and irregularity, and of her geometrical uniformity,' they will discover 'certain art-principles on which she works, and which alone are of any worth to the true artist.'

In another paper Mr I'Anson gives an account of the recent excavations in the Forum at Rome, by which remarkable discoveries of ancient structures have been made in that renowned precinct. Descriptions of the various relics are given, and their situation can be identified by a lithographed plan. 'On the north-eastern side of the Via Sacra,' we are told, 'formerly stood the Tabernæ or shops of the Forum, originally founded by King Tarquinius Priscus; they were naturally then required for the trades generally carried on in a market-place; hence the butchers' stalls, from one of which Virginius took the knife to stab his daughter. The schools for children were also among the shops in the Forum, and it is said to be there that Appius Claudius first saw Virginia reading.'

To readers who have been accustomed to associate largeness of space with greatness of power, Mr I'Anson's concluding remarks will be a surprise. 'Nothing,' he says, 'is, I think, more striking, considering how large a portion Roman history fills in the history of the civilised world, than the small area within which the scenes of this history were enacted. The Forum of Rome was the focus of all, and the Forum of Rome is not actually larger than Lincoln's Inn Fields. The Via Sacra through which we are told the Emperors passed—followed by captive potentates—with the trophies of victory, and long trains of armed warriors and slaves; where, on their way to the Capitol, the victorious Emperors proceeded to solemnise their triumphs with religious rites—and the captive kings were led to their prisons; where the great annual religious processions of the people, carrying their images and their gods, passed on their way to the Palatine Hill: this great thoroughfare of imperial Rome was only twelve feet wide.'

STORY OF A CORN-CRAKE.

The landrail or 'corn-crake' usually frequents and makes its nest amongst the long meadow-grass, generally depositing from four to six or seven eggs, and sometimes as many as nine or ten. The broods are often too young to escape before the cutting begins, and the machine makes sad havoc among them; the bewildering, sharp 'clack-clack' of the machinery seems to stupefy both mother and young ones, so that the poor things are often maimed or killed. In August last, while cutting down a field of grass, a corn-crake was observed to rise close in front of the machine and to flutter back and forward, crying pitifully; but as it was impossible to stop before the scythe had passed over the spot, it was concluded the little creatures had been killed; but on looking round at the spot soon after, the mother was noticed where the nest had been, and presently she came out to the open field *carrying in her beak* a small dark object, which on following her, was found to be a young crane, evidently not more than an hour or two out of the shell, and too young to walk or run, but happily uninjured by the machinery. The old bird now laid down her helpless young one, and returned, apparently to look for the rest of the brood. The workman, however, having meantime found another, laid it beside the first, which doubtless the mother removed to a safe place, as on looking for them soon afterwards, all of them had disappeared.

A U T U M N.

The rich autumnal shadows fall;
The first brown leaf wheels slowly down;
And all along the orchard wall
The mosses gather deeper brown.

Through all the rounded golden hours
No sound steals in from village street;
Alone the chimes from distant towers
Float hourly through my still retreat.

Across the vale, the rugged hills
Are starting from their Summer gloom,
And bursting heather glows and fills
Their skyward curves with purple bloom.

Again with Autumn comes the time
When you and I would cross the vale,
And reach the mountain foot, and climb
Till stars renewed the evening tale.

I wander still where Nature haunts
Her secret places seldom sought;
But even Nature something wants—
A subtle something, deeply wrought.

And here alone I sit, and now
Thy voice is hushed; but those dear eyes
That flashed beneath thy brave boy-brow
Are haunting me as daylight dies.

The sun slopes slowly to his rest,
This soft September afternoon,
Till all the colour leaves the west,
And steep the world in twilight gloom.

SOCIAL CONTRASTS.

No one who was present in Westminster Abbey when, on Sunday 6th July, Dean Stanley preached a sermon on Lord Lawrence, whose remains had been interred in the nave of that hallowed fane the previous day, can forget the truthful and impressive words uttered on the occasion. The subject was of that kind which a preacher of good understanding and high-toned sentiment seizes hold of for a practical purpose. In his whole life, Lord Lawrence had exemplified the finer qualities of the English character. Unselfish, and grudging no trouble in the line of duty, his resolute vigour had largely contributed to save India when that great empire was in jeopardy. The indomitable energy and persevering industry of his Lordship, his honesty and thoroughness in all he undertook, were lovingly referred to by the preacher.

Lord Lawrence, said Dean Stanley in his thrilling peroration, 'was a fine example of the value of India as a school of training for the breeding of a race of civil and military administrators in whom it is ingrained, not as a theory but as a duty, to study those complex forms of human character, so unlike our own, and yet so deeply instructive for us to contemplate, even without regard to the usefulness of such a study for their effective governance. It was this wide-seeing circumspection which made every word of rebuke from him, to Englishmen or natives, come with double force. A story of him was worth recording as an instance of his lofty dealing and good influence upon inferior minds. During the conduct of some important cause for a young Indian Rajah, the Prince endeavoured to place in his hands, under the table, a bag of rupees. He answered at once: "Young man, you have offered to an Englishman the greatest insult which he could possibly receive. This time, in consideration of your youth, I excuse it. Let me warn you by this experience never again to commit so gross an offence against an English gentleman." Many of them would never forget the moral effect upon themselves of his indefatigable, untiring industry,

so long as health and eyesight were left to him—his profound contempt for the idle, lounging, loitering habits in which so much of human existence is expended and destroyed. Any one who saw him felt at once that his presence had a certain majestic dignity and assured repose, which made us feel confident that in his presence, and in whatever emergency, we were perfectly safe. He was not only a leader of men, but a leader on whom men could rely without the apprehension of those sudden weaknesses and betrayals, by which some of the most gifted of the human race have diffused around them a sense not of security, but of mistrust. We were reminded when we saw him of that passage in Isaiah which says, "Who among us shall dwell with the devouring fire?" That is to say, who shall endure the scorching flame of temptation, danger, pain? How shall we gain that supernatural strength? And the answer of the prophet is the only true one: "He that walketh righteously." But if we ask further why and how is this, the prophet's following words give a reply: "His place of defence shall be on the strong rocks, bread shall be given him, his water shall be sure." That is to say, he shall be like a man in an impregnable fortress. Though the earth be wrapped in a circle of flames, he will look down on the raging sea of fire without fear. There is a well of water within the citadel which will not fail. The upright Christian man, whether martyr or missionary, statesman or soldier, looks down on weakness, pain, and obloquy as contemptible. He has the bread and water which should not fail, an undefiled conscience which gives him invincible courage. Such was the inner character which formed the spiritual basis of that mountain of moral strength. In his early days his friends called him "Iron John." As time rolled on his character came to rely more and more on religious influences, his gentler nature became developed, he submitted to failing powers and failing eyesight, and became each year more prepared for the great change which at last suddenly overtook him. Farewell, the Dean exclaimed, 'great Pro-consul of our English

Christian Empire! Where shall we look in the times that are coming for that disinterested love, that abounding knowledge of India like his? Where shall we find that resolution, mind, and countenance, which seemed to cry to us,

This rock shall fly
From its firm base as soon as I?

In these glowing sentiments we have a kind of word-painting of the present social condition of England. In numerous quarters are demonstrated an earnestness of purpose which bears up against the untoward circumstances which happen to present themselves in the ordinary battle of life; while alongside of this meritorious resolution are in too many cases provokingly seen those 'idle, lounging, loitering habits in which so much of human existence is expended and destroyed.' We know how people are apt to depreciate the present in comparison with a bygone generation; but with every allowance on this score, it is clear to us that vast numbers of young persons act as if idleness, amusement, and paltry indulgences were the chief concern in life. Labour, by which the world has been advanced in all useful learning and fine arts, is scorned as degrading and unworthy. Recreation carried to an unwarrantable extent is almost the sole object of consideration.

We are privileged to live amidst marvels of science and art. The electric light, steamers that resemble floating palaces—some of them floating farm-yards, railway trains that will transport you pleasantly at the rate of forty miles an hour, telegrams encompassing the earth with the velocity of Ariel! Unfortunately, science and art have outrun the capacity to make a good use of them. Among vast masses, the gifts of Providence are habitually and grossly abused. Everything satisfactorily improves but man. It would seem as if by no contrivance can society avoid being encumbered with swarms of people whom nothing can teach or admonish, and who, notwithstanding the prizes offered by industrial pursuits, ever keep themselves in the depths of wretchedness by their degrading excesses. We all know what efforts are made to stem the downhill current, and with what sadly disappointing results. In every town—the wealthier and more populous, the worse—there is apparently a mass of unimprovable human beings who prove a constant torment. Strange outcome of our boasted civilisation! This so-called civilisation is only like a gentle shower on the green-sward. It does no more than freshen the surface. Means to make it reach the roots of the social fabric remain to be invented.

The consequences are familiar to newspaper readers. Street disturbances, bad language heard in public thoroughfares, brutal assaults, homicides. A murder per diem now forms part of the ordinary intelligence. For the most part the murders take place in the idiotcy of drunkenness; poker, hammers, knives, hob-nailed boots, or

revolvers being usually the engines of destruction. It is hard to say, but it must be said, that weak-minded philanthropists who set themselves to uphold the 'gospel of idleness,' are less or more accountable for these disorders. Unaware of the ignorant and inflammable materials they work upon, they have encouraged by precept and statute the loosening of the obligations of thrift and professional diligence. Holidays and half-holidays are piled up with reckless indifference. The old days of religious observance, which were usually regarded with decency, have been swamped, blended in a catalogue of holidays which are a signal for the most odious revelries. There is a visible growth of this disorderliness and waste of means year after year. It is still on the increase, along with an increase in thriftlessness and demoralisation. The old accepted theory that 'the hand of the diligent maketh rich,' is contemptuously repudiated. The doctrine is gravely put forward, that the true method for raising wages is to curtail production, to work as little as possible. One could laugh at this newfangled nonsense, were it not too grim a joke to make fun of the principles which regulate individual and national subsistence.

The idle, lounging, loitering, useless existence pointed to by Dean Stanley as a contrast to that of the late Lord Lawrence, is largely exemplified in the lives of young men, who at one time would, through personal favour, have found a lodgment in the civil or military service of the crown. The modern practice of competitive examination, whatever be its merits or demerits, has at least been the means of largely recruiting the ranks of genteel ne'er-do-weels. With vast continents still lying almost in a state of nature, and offering a splendid field for the settlement of the young and aspiring, it is pitiable to observe how few of this class possess the tact and enterprise to embrace the opportunity offered. Pampered by parents, or relying on some small patrimony, and perhaps with a silly pride of birth, they prefer a life of mere pleasure and amusement to one of honest industry, and constitute the loafers who hang about the clubs and bars of restaurants. You know them at once. Their cut-away tweed jacket, their moustache, their constitution weakened by depravity, and their boisterous laughing and talking, point them out as beings who never earned a shilling, and never will. Their chosen rôle is parasitically to depend on any one who will keep them without regard to the future, to eschew honest labour, play at cards and billiards, frequent horse-races, and dawdle away existence in a manner alike frivolous and mischievous. As torturations, some of them possibly have been sent to push their way in the colonies or South America; but with their idle and extravagant habits, success is out of the question. If they do not sink into a premature grave, back they come, to weary every one out with their luckless inaptitude and perversity. In comparison with such pretentious

yet utterly useless beings, how immeasurably more to be respected are the humblest toilers by the wayside striving to earn a bite and sup for daily subsistence!

Never before were there such strenuous and costly efforts made to extend the blessings of education, but practical advancement suffers a constant obstruction in the tendency to treat personal responsibilities with indifference. A learned professor, Dr Grainger Stewart, in lately addressing a body of newly appointed medical graduates in the University of Edinburgh, cautioned his young friends against professional indifference and superficiality. He entreated them to 'be honest, to be thorough.' Here he hit on a prevalent deficiency—a want of earnestness and thoroughness in the performance of professional and social duties. Of course, it is only the thoroughly earnest, patient, and self-sacrificing who ultimately succeed, and after a brilliant career, reap rewards like those which fell to the lot of Lord Lawrence—or let us instance Sir Rowland Hill, the successful projector of the penny post, who has just sunk to his rest after a long and useful career, followed by the blessings of mankind. The thing to be lamented is, that so comparatively few will put themselves to the trouble to secure any rewards whatever, including the greatest of all rewards, a sense of having done their duty, and the approval of their own conscience.

While men like Dean Stanley and Dr Grainger Stewart are pointing to those correct principles of moral discipline which are the glory of a people, there are hundreds who are doing their utmost to promote idleness and sensuality. There goes on a sort of war of good and evil. For example, is not the whole modern system of horse-racing and betting a disgrace to the country? In itself it is enough to counteract the best aimed beneficial influences. So, if not checked in time, is the spread of club-houses. We say nothing against the older and more staid institutions of this kind, but refer particularly to the clubs composed chiefly of young men, whose object seems to be the killing of time and squandering the means that happen to be at their disposal. When through laxity in balloting or other causes, clubs subside into this category, the more elderly members are apt to withdraw; the reading-rooms are meagrely frequented, and the crowding is towards the restaurant where drink is obtained, or to the apartments specially devoted to the playing of cards and billiards. According to all accounts, the favourite recreations are games with cards so extremely hazardous as to bring swift ruin on the inexperienced youths who engage in the play. We see by a London newspaper that the gambling club-houses in the metropolis are rapidly on the increase.

Whether from this cause or otherwise, thoughtful persons are beginning to entertain serious doubts as to the propriety of allowing club-houses to remain on their present footing. Though nominally of a private character, they are practically unlicensed public-houses, and offer convenient opportunities for wasteful indulgence when the different classes of licensed establishments are shut. Nor by any ordinary arrangement can this be prevented. As private institutions, they are as much beyond the scrutiny of magistrates and police as private dwellings. Looking to the abuses

that have latterly crept in, it would not excite surprise were the whole of the club-houses subjected to the laws and restrictions which regulate public hotels and taverns. It must, we think, shortly come to this. Meanwhile, we simply refer to them as being among the agencies which encourage idleness and misexpenditure.

THE BRAVE SWISS BOY.

A TALE FOR THE YOUNG (CONTINUED).

CHAPTER V.—ON THE TRACK.

THE night passed slowly away. Just as Sol was pouring his earliest morning rays into the little room where Walter had lain unconsciously for so many hours, the sleeper awoke, rubbed his eyes, and called aloud for his companion; but to his surprise, received no answer. He was astonished to find that he had gone to bed without taking off his clothes, but suspected nothing until he saw that Seppi was not in the room, and at the same moment missed the belt from his waist and the papers from his pockets. When the whole extent of the calamity flashed upon him, he felt completely overwhelmed. A cold perspiration started to his face; he trembled in every limb; and but for the support of the bed, would have fallen on the floor. 'Merciful powers!' he exclaimed, when he recovered his speech, 'can it be possible that Seppi has robbed me and gone?'

He rushed to the door, which he found was locked. After kicking at it with great violence for some time, he aroused the attention of André, who came up and, after opening the door, demanded the reason of such behaviour.

'Where is Seppi?' exclaimed Walter, paying no heed to his inquiries. 'Tell me instantly what has become of him!'

'How should I know?' was the rough reply. 'He left the inn before daybreak.'

Walter's fears were fully confirmed. He sank into a chair, and gave way to an outburst of indignation.

'Don't trouble yourself about being left alone,' said André; 'your friend told me last night that he would be sure to return to-morrow, and has given me orders to let you have everything you ask for.'

'You've seen the last of him,' returned the youth. 'He has robbed me, and has got safe away by this time. But I won't rest till I have hunted him down; and woe to him then!'

He rushed to the door to carry out his purpose; but André stopped him. 'Oho, my fine fellow, that's what you're up to,' said he. 'I see now that your friend was right when he told me that you were not quite right in the upper story. You will please stay quietly here till to-morrow morning, and then you can make it all right with him yourself. You shan't stir out of this room till he comes back, so make up your mind for it.'

With these words the fellow quietly turned on his heel and left the room, and having locked the door, went down-stairs again without paying further regard to Walter's indignant remonstrances.

There being no possibility of escape by the door, Walter ran to the window, and looking out,

saw that the window-sill was scarcely twenty feet from the ground, and that no one was visible outside. His plans were quickly formed. Tying the sheets together, he fastened one end to the window-frame, and lowered himself to the ground. But a new difficulty presented itself. Which direction should he take? While he thus stood for an instant in doubt, he heard a shout from the window overhead, and looking up, beheld André, who by this time had brought his breakfast.

'What game is this you're up to?' exclaimed the unwelcome custodian. 'Stir a foot from there till I come, or it will be the worse for you.'

Paying no heed to this threat, Walter ran at the top of his speed towards the main road, and would perhaps have made good his escape, had not a broad ditch barred his way, which he was in the act of crossing when he slipped, and was overtaken by André, who, after a struggle, managed to secure his charge.

'I've got you again, my boy!' said his captor triumphantly. 'You might as well have paid attention to what I told you, for now you must march back again, and take up your quarters in the cellar, instead of having a comfortable room. I'll warrant you'll not get away again in a hurry.'

The unfortunate youth, half-stunned with the events of the morning, and considerably bruised with the fall, was overpowered by the superior strength of his pursuer, and had to resign himself quietly to his fate. They had just got back to the inn, and were in the act of entering, when the sound of wheels was heard; and on looking back, a post-chaise with four horses was seen rapidly approaching the inn.

The carriage was open, and two young men reclined upon the soft cushions, while a handsome dog lay upon the front seat, and looked up with an intelligent glance at one of the gentlemen who seemed to be its master.

'Let us have some refreshment,' said the gentleman to André, who was somewhat taken aback by the unexpected arrival of travellers at that early hour. 'Look sharp, my man! We must be in Paris in an hour, and have no time to lose.'

Forgetting his prisoner, André hurried in to make the necessary preparations; while Walter, pale and breathless, leaned against the side of the door.

'Mr Seymour!' he suddenly exclaimed, on beholding one of the travellers. 'Mr Seymour! Pray, assist me.'

The stranger leaped from the carriage and hastened towards the unhappy youth.

'Can I believe my eyes?—Watty!' he exclaimed, 'Watty, from the Bernese Oberland!—Look here, Lafond; this is the boy that got me the young vultures from the Engelhorn, the narrative of whose courage you admired so much.—But what are you doing here, my boy? And what is the meaning of all this distress?'

'I have been robbed of a large sum of money here, and the thief has escaped with it. I was going in pursuit of him'—

'Don't believe a word of what he says sir,' interrupted André, who at that moment issued from the inn. 'The poor fellow is not right in his mind. His companion told me so, and I am going to take care of him till he comes back. He'll be here to-morrow.'

'Fool!' exclaimed Mr Seymour angrily, 'this young man is an old acquaintance of mine. Don't you dare to lay hands on him, or you shall suffer for it!—And now Walter, tell me the whole story as quickly as you can.'

The young man related all that had happened since his arrival in Paris.

'It's a bad affair, my good fellow,' said Mr Seymour, shaking his head and shrugging his shoulders thoughtfully. 'Your companion has most likely travelled all night, and it will be hard work to find out which way he has gone. But never mind; we must try what can be done. Come with us to Paris, and I will get the police to make instant search for the thief.—But in the first place,' he continued, turning to André, who looked on in sullen astonishment, 'let us have something to eat; and then we'll be off to Paris, where the scoundrel is most likely hiding himself.'

Mr Seymour's companion, a pale and delicate-looking man, had listened in silence to all that had passed; but while they were partaking of the refreshment that had been hastily prepared, he joined in the conversation.

'My dear Seymour,' said he, 'I think I know a better plan to get on the track of this swindler than if we had the help of all the policemen of Paris.'

'Name it,' returned his friend.

'Well, you know the St Bernard dogs are the best in the world for following up a scent; and as Hector is a capital specimen of the breed, I think we cannot do better than set him on the track.'

'But the dog doesn't know him, so how can he trace him?'

'The fellow has perhaps left something behind him in his hurry; if so, then let Hector get his nose to it, and I'll wager anything that he'll follow him up even if he is fifty miles off.'

'That's a capital idea,' assented Mr Seymour, delighted at the prospect of serving his young friend. 'Hector knows that we're speaking about him. See how knowing he looks!—Run Walter, and see if your precious companion has left anything behind him.'

Accompanied by André, who began to perceive that Seppi had cheated him, Walter sped up-stairs to the room in which he had slept, and soon returned in triumph.

'He has left some of his clothes,' exclaimed the now excited youth. 'They are worthless things; and certainly no loss to him, after getting possession of all that money.'

'Not so worthless after all,' signified Mr Seymour. 'Who knows but we may find this bundle worth fifty thousand francs to you, Walter, or rather to Mr Frieshardt? Lay it down here.—Now then, Hector, take a good sniff!'

The hound jumped from the carriage, smelt the bundle all round, then looked up at his master in an intelligent way and gave a short deep bark.

'Hector will be on the track immediately,' was the assurance given by Mr Lafond.—'Find—lost—find, my fine fellow!' he exclaimed.

The animal thoroughly understood its master's wish, and ran round the inn with its nose close to the ground. Suddenly it came to a stand, looked back, and gave another short bark, as if to say 'Here!'

THE BRAVE SWISS BOY.

'Bravo, Hector!' exclaimed both the gentlemen in delight. 'Come and smell again. Good dog!'

The dog sniffed the bundle once more, and after making another detour of the inn, stood still at the old spot.

'He has got the scent now, without a doubt,' said the stranger.—'Keep up your heart, young man, and we'll get the money out of this scoundrel's clutches just as certainly as you got the birds from the Engelhorn for my friend. Jump into the carriage.—Follow the dog, postillion. Off with you!'

This order set both the horses and the dog in motion. Hector kept his nose near the ground, and went on very fast, not, however, in the direction of Paris, but rather more to the south, along the left bank of the Seine.

'Aha! the fellow has been cleverer than we supposed,' said Mr Lafond. 'Instead of going to Paris, where he would have had the police on his track, he has most likely taken the road to Havre, and intends crossing to England or America with the first ship. He might easily have escaped if we had not had the dog with us.'

'We haven't caught him yet,' said Mr Seymour; 'but I feel sure that Hector knows what he's about, and we shall most likely overtake the fellow before night comes on.'

The pursuit continued rapidly. The sharp-scented hound never shewed the least doubt or wandering. On a few occasions it turned off into by-paths to the right or left, but always returned in a few seconds to the main road that led to Havre.

The horses were changed two or three times, but the dog seemed as fresh as when the pursuit commenced. It was growing late in the afternoon; but although Hector continued to hold on as before, Mr Lafond shook his head, and began to doubt whether they were on the right track after all.

'I hope our guide isn't misleading us,' said he. 'Supposing the fellow left Boissy about eleven last night, and went on in this direction without stopping to rest himself, he couldn't have got any farther than here. We have come so fast that we ought to have overtaken him by this time.'

The two friends made a careful calculation of the time and distance, and Mr Seymour also began to feel rather anxious. He stopped the carriage, called the dog back, and made him smell Seppi's bundle again, which they had taken care to bring with them. The dog gave the same short sharp bark as before, then turned round again, and continued the journey in the old direction.

'I haven't the least doubt now,' said Mr Seymour cheerfully. 'We must be on the right track.—Go on, postillion!'

On they went, the wheels rattling over the uneven road, the horses trotting merrily, and the faithful hound running on in advance, and shewing scarcely any signs of fatigue.

After the lapse of half an hour, the dog stopped suddenly, threw its head up in the air, and sniffed all around in evident confusion; then after making a slight detour with anxious speed, leaped across the ditch by the road-side. With a loud bark that seemed to express satisfaction, the intelligent creature made for a small clump of bushes at a little distance from the road, into which it disappeared. In the course of a minute or two the

barking was renewed; but *this time in a threatening tone.*

'We've got him!' exclaimed Mr Seymour. 'There's no doubt the fellow found he could get no farther, and has taken up his quarters in the cover yonder, to make up for the sleep he lost last night.'

'Let us go over there, then,' said his companion, leaping from the carriage and across the ditch. 'Hector is calling us, and is sure to be right.'

Mr Seymour leaped the ditch, followed by Walter and one of the two postillions. Guided by the barking of the dog, they soon reached the thicket, and there found the man they were in quest of pinned to the earth by the sagacious animal.

'O Seppi, Seppi!' exclaimed Walter in astonishment and sorrow, 'how could you be guilty of such an act as this!'

The conscience-stricken man paled before the indignant youth.

'You robbed me, and thought that you could get away without being found out; but you have over-reached yourself this time, and must suffer the consequences. Hand back the money you've taken, and suffer the disgrace of being regarded as a common thief.'

'I will give you back everything, and beg your pardon for all I've done,' whined the wretched drover, 'if you will only release me from this savage brute, that has nearly been the death of me.'

At the call of his master, the dog quitted his hold reluctantly, but seemed ready at the least sign to seize his prisoner again. As the terrified thief, however, made no attempt to escape, and commenced to unbuckle the money belt, the dog was secured.

'Open the belt, and see if the money is all right,' said the drover in a cringing tone.

Walter counted the notes and gold, and was glad to find the contents untouched. Seppi rose to his feet meanwhile, but stood looking to the ground in shame and fear.

'What shall we do with him?' asked Mr Lafond, pointing to the trembling scoundrel.

'The best thing would be to tie his hands behind his back and hand him over to the nearest police station,' was the reply.

'Have mercy upon me!' howled the drover, throwing himself on the ground and clasping the knees of his captors. 'Do have pity on me, gentlemen!—Don't be hard-hearted, Watty! It's the first time I ever did such a thing in my life. The devil tempted me when I saw such a large sum of money.—Forgive me this time, gentlemen, and I will never again be guilty of stealing!'

'Do you know nothing else against him?' inquired Mr Seymour.

'No; nothing, sir,' replied the generous-hearted youth. 'I believe he was always looked upon in Meyringen as an honest fellow, and I think he is telling the truth. Pardon him this time, and let him go his ways. I hope this will be a lesson to him.'

'Be off with you then!' said Mr Seymour. 'Although you have behaved so shamefully towards your companion, he begs that you may be forgiven.'

Seppi was overjoyed at being let off so easily.

He had not dared to expect that Walter would have taken his part, and felt really thankful that his first great crime had not met with a severe and terrible punishment. With earnestness in his tone, he thanked his former companion, and with unaffected emotion, assured him solemnly that he would never again stretch out his hand to that which did not belong to him.

'I forgive you with all my heart,' said Walter; 'and as God has so ordered it that you couldn't carry your wicked design into execution, I will say nothing about it to Frieshardt when I get home again. Good-bye, Seppi, and take care that you don't allow yourself to be tempted this way again.'

The drover renewed his protestations, and assured Walter that he should never forget his kindness. 'You shall never,' quoth he, 'have reason to be sorry that you have spared me this time.'

He kissed Walter's hand and moistened it with his tears, and was gone.

'The unhappy miserable fellow!' said Mr Lafond. 'Upon my word, I really believe his repentance is sincere. If he takes this affair as a warning, I shall not be sorry that we have let him off so easily.'

'I hope he *may* turn out an honest character,' rejoined Mr Seymour. 'I expect to go back to the Bernese Oberland next summer, and I shall look after him then. It will be a bad thing for him if I find he has gone astray again.'

'I don't think there is any fear of that sir,' said Walter. 'Mr Frieshardt told me that he was looked upon as a respectable young man, and I think this is the first time he has fallen into crime.'

'Then so much the better for him,' replied Mr Seymour. 'We shall find that out some other time. But now I think we must set off towards Paris, if we are to get there to-night.'

After a long journey, the travellers reached the French metropolis; and Walter repaired with Mr Seymour to one of the best hotels, where in a soft and luxurious bed, he soon forgot the toil and anxiety of the day, and slept sounder than he had ever done in his life.

SALMON FOR THE MILLION.

THAT the salmon is a prolific fish has long been popularly known. A female salmon yields as a rule about a thousand eggs for every pound she weighs; but while that fact may be held as being established, it is a fact equally well known that out of twenty thousand ova which may be deposited by a particular fish, only a very small number reach the market in the shape of adult salmon. Of the countless thousands of eggs which are annually deposited in the spawning-beds, probably not one half yield fish; because in the first instance, a vast number of the ova escape fertilisation from the milt of the male salmon; and in the second place, large quantities are devoured by hosts of enemies during the spawning season, or are carried from their places of deposit (redds) and destroyed by floods.

Of those fish which in course of time are hatched,

many thousands, unable to seek their food, die of starvation, while other thousands fall a prey to animals of various kinds which instinctively seek their destruction. In consequence of these drawbacks the salmon is, comparatively speaking, a scarce and costly fish. A fish of twenty-five or thirty pounds-weight is, in the early part of the season, of more value than a South Down sheep of three times the weight. It is not unusual for a cut of salmon to be sold at the West End of London during the months of February and March at the rate of about seven shillings and sixpence per pound-weight. At the season indicated, the salmon is emphatically 'the rich man's fish.' Enthusiasts in fishery economy tell the public that a day will come when it will be possible to purchase salmon at about fourpence per pound-weight; but all such statements must we fear be taken with more than the proverbial grain of salt. At the present time the dainty is dearer than ever, and notwithstanding that artificial spawning and protected breeding have been largely resorted to during the last quarter of a century, the fish does not increase in the ratio of the increasing demand for it. It is to the high price demanded for fresh salmon that the public are doubtless indebted for the importation of those vast supplies of 'tinned' fish which are now imported to this country from America.

On the Columbia River, a surprising trade in this commodity has been developed during the last ten years; and if the public is obtaining what may, in a comparative sense, be called 'cheap salmon,' it adds greatly to the wonder which attends the fact that it is brought from the distant shores of Oregon. Scotland for quantity and quality of fish is a salmon country *par excellence*, a remark which applies in a lesser degree to Ireland; but the fish of these countries can seldom be obtained under eighteenpence per pound; whilst in the remote towns of the United Kingdom the canned fish of the M'Cloud or Columbia River can be purchased, can and all, containing a pound-weight of salmon cooked and ready for eating, for less than half the sum named. How is that accomplished? will be asked. How comes it that a pound of salmon nicely cooked and packed up in a neat tin case, can be prepared and brought to us from such a distance as has been indicated, to be sold at eightpence or ninepence, whilst fish caught at our own doors cost double the money? We are quite able to explain the reason. The salmon in this country is a proprietary fish. On the river Tay for instance, which yields the finest quality of salmon now brought to market, those who capture the fish have to pay a rental of over twenty thousand pounds per annum whether they capture any fish or not. But no rent is exacted on the rivers of Oregon; the fish of the Columbia River are free to all, although the plentifulness of those salmon will ultimately prove in all probability the cause of their extermination. With no rent to pay and every man fishing for his

own hand, the exhaustion of the largest river is but a work of time.

As many as twelve million pounds-weight of salmon have been taken from the Columbia River in the course of a season; that weight of fish, estimating each to have weighed twenty-two pounds, represents a capture of say five hundred and forty-five thousand four hundred and fifty salmon. The fish now taken from the Columbia River are nearly all 'canned;' and as has been indicated, a large proportion of the salmon so prepared is exported to Europe. The work of canning salmon, however, is not confined to the Columbia River; there are flourishing canneries on the Umpagna, Fraser, Roque, and other waters. To start a cannery, notwithstanding that the fish cost nothing beyond the wages and allowances paid to the men who capture them, requires a 'bit of money.' In some of the American canneries the capital required has been as much as ten thousand pounds, and some newly projected establishments will involve double that amount. For the greater convenience of receiving the raw material and shipping the manufactured article, the canneries of the Columbia about on the river, a portion indeed of the building being erected over the water. At one end of the erection the newly captured fish are taken in, and after being made to traverse a semicircle of workshops, in which they are manipulated, the boxes containing the filled cans are shipped for San Francisco, or Portland at the other end, both ends being quite accessible to the boats or steam-vessels engaged in the trade. The extent of the salmon-canning on the Columbia River will be more obvious when we mention that as many as three hundred thousand cases have been made up in one season, each case containing forty-eight cans of one pound each; which indicates a total of between fourteen and fifteen million pounds. These figures are quoted from official records of the trade. In another year as many as four hundred and fifty thousand cases were filled and despatched to Liverpool and elsewhere; that quantity representing the capture of six hundred and sixty-one thousand salmon, weighing twenty-two pounds each.

The economy of a cannery is simple enough, and may be briefly described. But first of all it is necessary to say a few words about the fish, and the river whence they are taken. The Columbia is of vast extent, and its volume of water enormous, occupying an area which would embrace with great ease all the salmon and other streams of the United Kingdom. Salmon run up the Columbia to a distance of four hundred miles from the sea, so that they obtain ample living and spawning room in shallow places of the main stream, as well as in its numerous tributaries, which, if joined together, would extend over two thousand miles in length. Various fishes of the salmon kind inhabit the Columbia River and its affluents; but the fish which is selected for the canneries is locally known as the 'Chinook salmon,' and differs in no appreciable way from the salmon of the Tay or the Tweed. Curiously

enough, considering the expanse of water, the plentifulness of its food, and the room for growth, the size of the Columbia salmon is not greater than those of our own rivers—the average being only twenty-two pounds; out of a capture of one hundred thousand recently taken, only one weighed as much as sixty-five pounds.

The Chinook salmon is a migratory fish, ascending and descending the river at its appointed seasons. There are, it is said, twelve distinct varieties of anadromous or migratory salmon native to the Columbia and its tributaries. The fish are captured in a variety of ways. Before the days of canning, when Columbia salmon were killed only for local consumption, clubs and spears were in universal use; and in places where the water was shallow and the fish numerous, they were easily taken by means of large hooks attached to long and slender poles. They were also caught by hook and line, the bait being one forbidden to us—salmon roe. In order to supply the now enormously enhanced demand, drift-net fishing is resorted to, as also seining. The nets in use are of vast size, and of a mesh sufficient to allow the head of the fish to enter as far as the gills. As a rule, a Columbia River drift-net is about three-quarters of a mile in length, and twenty feet in depth. Such nets have a grand power of capture; so also have the seine-nets, as many as two hundred fish having been taken by the latter at one draught.

During the fishing season, which lasts from April to July, the round of work at the canneries is prosecuted with great eagerness, and an all-pervading anxiety to push ahead so long as the fish are 'running.' The canning works of to-day are an improvement on those which originally set the trade in motion; they are complete and self-contained, everything required in the business being manufactured on the premises; the tins in which the salmon are sold, as well as the wooden cases in which they are forwarded to market. Foreigners are largely employed in the enterprise. Italians capture the fish, and Chinamen prepare them for consumption by the public. Without the aid of the cheap labour symbolised in the employment of John Chinaman, the canning interest would never have attained its present dimensions. From the moment the salmon are placed in the receiving-rack of the cannery till they are ready for shipment, it may be safely said that none but Chinese hands touch them.

Hundreds of fish as they are brought by the fishermen are accumulated on racks at the entrance of the cannery, so as to be accessible to those who require to handle them. A flexible water-pipe with a strong and searching flow of water is used for cleansing the salmon, which so soon as they undergo that process, are marshalled according to size within reach of the first operator. This person seizes a fish by the gills, lays it out on a table, and with great dexterity, by means of a sharp knife deprives it of those portions not required for filling the can, namely the head, fins, tail, &c.; an incision is made in the back, and the intestinal matter quickly removed, after which process the carcass is thrown into a large tub half-filled with water. The decapitating and eviscerating process it may be mentioned reduces the weight from an average of twenty-two pounds to an average of seventeen pounds. The duty

of the second operator is to wash, scrape, and otherwise cleanse the so far prepared fish; having done so, it is passed on for inspection to man number three, who at once remedies any defect in the cleansing, and sees generally that the previous operations have been thorough. The fourth person ranges the fish in the cutting-trough, where, by means of a series of blades driven by a powerful crank, they are divided into portions; which in turn are operated upon with great rapidity by another Chinaman, who cuts them into longitudinal sections. Carried away in baskets, the pieces are neatly and quickly filled into the cans in which they are to be presented for sale.

Nothing but constant practice could have perfected this part of the work. It is a treat to see how neatly the men, in the most impartial way, fill the box with an alternate thick and thin layer of the fish. A little spoonful of salt being placed in each can, as rapidly as each is filled, the lid or top is soldered down, after which they are ready for the cooking-house. In that place the filled cans are treated in quite a wholesale fashion; arranged on frames, they are run to the cooking-house in quantities containing ten dozen; and as many as three frames at a time are immersed in a huge steamer constructed for the purpose, the period allowed for the cooking of a can being exactly one hour. Removed from their bath of steam, the cans have each a small hole or breathing-place bored in them, so as to admit of their cooling as speedily as possible and of the air with which they are filled blowing off. The tins are next placed, for a period of two hours, in a gigantic boiler full of boiling salt water; after which they are individually examined, to see that the ends have assumed a concave shape. Such tins as have not taken this shape are condemned, whilst the others are passed rapidly forward to be varnished and labelled. All the processes are pushed forward with great celerity; and as the men engaged in the work are paid by result there is a sufficient guarantee against idleness. Before being placed in the cases in which they are forwarded to market, they are again subjected to a close scrutiny, and tapped with a hammer to see that they have the proper ring and that there is no flaw of any kind; and it is a proof of the care and dexterity of those employed that but few of the cans are rejected.

By means of the division of labour above indicated, immense numbers of fish are caught and cooked in the United States, in the course of the few months during which the season lasts. Last year over a million and a quarter of salmon were captured and canned, the largest number brought to the canneries in one day being twelve thousand, one of which was a patriarch of the weight of sixty pounds! In some of the larger establishments, as many as three thousand salmon can be manipulated in the course of a day; these are received in the morning, and in the course of twelve hours, thanks to the unceasing industry of the Chinese labourers, they are cut up, canned, cooked, and ready for market.

Avoiding matters that are too technical, we have now gone over the whole range of business connected with salmon-canning. Counted by single tins, the profits of a cannery would appear infinitesimal; it is the enormous quantities which

are prepared that yield the return necessary for the amount of capital invested, and the intelligence and enterprise which have created this trade of purveying salmon for the million.

THE COOL ENGLISHMAN.

CHAPTER I.

MANY years ago—so long ago, in fact, that most of our readers were at the time we speak of either in their infancy or not yet come into existence—a douce, middle-aged gentleman, whom we shall call by the name of Simon Lee, was travelling in the east of Ireland. The greater part of his journey, as it has no connection with the incidents which we are about to present to the reader, may be passed over in silence. We confine ourselves to the narration of the adventures which he encountered at the close of his tour.

At the time of which we speak, railway travelling was yet unknown, and stage-coaches, though drawing near to the termination of their existence, were still the ordinary means of locomotion. Mr Simon Lee was therefore forced to accomplish his journey in the lumbering old vehicles which then existed, occasionally making use of a small car or chaise when his destination happened to be inaccessible by coach. It was on one such occasion that the adventure occurred to him which it is the purpose of this paper to narrate.

Early one morning Simon set forth in a car from Dublin, where he had been staying, with the intention of reaching the town of W— ere the night set in. It was one of the last days in the month of August, when the warm charms of summer are fading into and blending with the rich ripeness of the yellow autumn. Our traveller's way lay among sunny meadows and green fields, intersected by silvery streams, shady lanes, and vast expanses of waving corn, which were crowned in the distance by woody hills. The blue sky was unflecked by the smallest cloud; the air was deliciously soft and warm; and the birds sang merrily and sweetly, as though they entered into the spirit of the season. No wonder therefore that it rejoiced our traveller's heart. No wonder that often and often, when some flowery nook or bosky dell came to view, or when some more than ordinarily rich expanse of country was presented to his gaze, he bade the driver of the car rein in his horse, in order that he might gaze on the newly discovered beauty to his heart's content. This is certainly the way to enjoy a drive, but is by no means favourable to rapid progress; and it was therefore not surprising that, when evening set in, and the sun sank in splendour behind the western hills, our traveller found himself but little more than half-way upon his road. He therefore enjoined the driver of the car to push on rather more rapidly, and to make no further stoppages on the way. This being done, they in due course arrived at the little village of A—, which is about five or six miles from W—. By this time, however, the lateness of the hour, the fast-gathering gloom and wild-looking clouds, which had for some time been assembling on the face of the sky, all combined to disincline the traveller to continue his journey. Huge drops of rain fell with a heavy thud on the road, or on the garments and faces of the two occupants of the chaise; and

this circumstance, together with low mutterings of distant thunder, rendered the prospect of any further drive somewhat disagreeable.

Before we proceed with our story, let us say a few words on the appearance and position of the village at which our hero had arrived.

A— is, or was at the time we speak of, a beautiful and romantic little spot. It nestles cosily among the mountains, in a deep ravine or valley, which on either side is lined with grassy hills of considerable height. These hills stretch up for some distance along the valley, and then unite in one common range. Down their sides gurgle various streamlets, which continue to give forth the sweetest and clearest music, till blending with a large and stony brook which intersects the middle of the valley. On one side of this brook, somewhat detached from the rest of the village, which is more elevated in position, and lies perched on one of the hill-sides, stands a small but solidly built inn, which with its white-washed walls, quaint porch, and dark-green mantle of ivy, presents an exceedingly romantic and picturesque appearance.

Before this inn it was that Mr Simon Lee directed the driver of his chaise to pull up, though yet uncertain whether to remain there for the night, or to carry out his original intention of proceeding on to W—. There he stayed irresolutely for several minutes; while his attendant, probably not relishing the prospect of a long cold drive in the dark, earnestly entreated him to take the former course of procedure, adducing in favour of it the insecurity of the roads in consequence of the late heavy floods. This settled the matter. Our hero consented to stay. But what great events both in the life of individuals and of nations depend on apparently unimportant and insignificant circumstances! If Simon had not decided to remain at the inn, the adventure which we are about to relate would never have occurred to him.

At this juncture, it happened that the landlord of the establishment, in order to welcome the guest, advanced to the door; and as he threw it open, such an agreeable odour of various savoury compounds in the kitchen of the little house of entertainment, was wafted to the nasal organs of Mr Simon Lee, that flesh and blood could hold out no longer. On the one hand was a good supper and a comfortable bed in prospect, for as Simon thought to himself, the two go together; on the other hand was a cold journey in a dark night, with the probability of being drenched by the impending storm. With these considerations laid bare before him, no living mortal would have hesitated as to which course to take. Simon decided as other men would have decided, had they been in his place. He therefore, having descended from the car, suffered himself to be conducted into the inn by the obsequious landlord, while the driver of the car retired to the stables.

As the reader will naturally be desirous to be in some measure acquainted with the personal appearance and character of our hero, we proceed to furnish him with the required information. Simon Lee or, as he was familiarly called, Simon, in outward deportment and exterior somewhat resembled the redoubtable Don Quixote. He was of respectable middle height,

with a tendency to baldness, small greenish eyes, a high forehead, and a somewhat receding chin. He had occasionally, when excited or alarmed, a quick and nervous manner, which by ill-natured people was considered as a token of his possessing what is commonly called 'a bee in his bonnet.' This, however, was a libel, for no one could be further removed from madness than Simon Lee. Not even a 'fine frenzy' of poetry could be adduced as a token of eccentricity. He was careful, sensible, and practical; and if he had anything in his character which might detract from his other merits, it was his extreme nervousness and timidity. He was one of the most nervous and timid men who ever did, or ever could have existed; and indeed in this respect he rather resembled a woman, and a very timid woman, than a man. He was always on the lookout for danger and misfortune, always seeking to avert it, and withal seemed to have a peculiar instinct for it. He resembled, if we may employ such a simile, the hunted deer, whom the faintest indication of the approach of the hunters who seek to destroy him, the slightest rustle made by their advancing footsteps, even the displacement of a twig or a leaf, will arouse from his woody covert, and cause to bound away to find safety from the pursuers. Simon was like a hunted animal. The fear of danger perpetually haunted him. As a necessary sequence he was always endeavouring, by all possible means, to avoid it. But like most timid people, he was often unnecessarily cautious, which not unfrequently brought down upon his head the very misfortune from which he made such strenuous exertions to escape.

Now, the chief objects of Simon's fear and aversion were robbers. For a score of years it is said he slept with a pair of loaded pistols beneath his pillow; and during that period his midnight slumbers were entirely undisturbed by any nocturnal visitors. One night, however, he actually did hear a noise at his window, as of some one endeavouring to obtain entrance unlawfully. He raised himself up in bed, and with a tremulous hand fired off one of the deadly weapons in the direction whence the noise proceeded.

He then awaited the result with his head smothered up in the bed-clothes (a position which timid people seem to think is the one most likely to protect them from danger). After the explosion of the pistol there came a sound of shattered glass, which fell with a crash on the ground beneath, and, as afterwards transpired, upon the head of an unfortunate foot-passenger, who happened to be standing under the window, and who brought an action for damages. And though Simon remained in the uncomfortable posture described, not daring to stir till the morning dawned, it never transpired that any burglar had been endeavouring to obtain ingress to the chamber. This little circumstance, combined with the fact that upon a subsequent occasion one of the pistols went off of its own accord in the middle of the night, thereby startling the neighbours very considerably, and Simon himself most of all—since the explosion took place immediately beneath his head—induced our hero to abandon these somewhat dubious instruments of self-preservation.

Thus the reader will see that the prevailing features in Mr Simon Lee's character were

timidity, nervousness, and excessive cautiousness, the latter, as we have remarked, often involving him in the very danger from which he desired to escape. But the object of this story is not, as the reader may imagine, to give some further instances of these peculiarities in Simon's moral organisation, but rather to shew how, by a very simple and natural mistake, a man may appear to act with great courage and coolness in a moment of extreme danger, though he be not in general either courageous or cool; that is to say, by being ignorant of the nature or imminence of the danger, he may seem to act very coolly and indifferently with regard to it. This, as the reader will perceive, if he will kindly continue the perusal of our story, was the case of Mr Simon Lee.

We now proceed to take up the thread of the narrative where we relinquished it.

Mr Simon Lee's entry into the inn set, as we have implied, the seal upon a momentous epoch in his existence. Of this, however, he himself was of course unconscious. He walked into the neatly sanded parlour, where a brightly blazing fire leaped up and flickered on the hearth, and cast a ruddy light on the walls, latticed windows, and old-fashioned chairs which stood around. We will pass over our traveller's hearty supper, and the cautious and qualified eulogium vouchsafed to the landlord and landlady, upon the arrangements of their inn; vouchsafed, partly, we believe, in order to put them in good-humour, and partly to impress them with a due sense of his own dignity and importance; for qualified praise, we may here remark, goes to shew that the laudator, while condescending to take matters as he finds them, is nevertheless hard to please and has been accustomed to much better things.

After conversing a while with his host and hostess, Simon felt a sensation of exhaustion creeping over him, which was probably engendered by his long day of travelling in the open air. He accordingly expressed a wish to be shewn to his sleeping-apartment, and the hope that it was clean, and the sheets of the bed well 'aired.' The landlord on this broke out into such an extravagant eulogy on a certain bedroom and its appurtenances, with which he could furnish the traveller, that Simon was fain to withdraw to that luxurious apartment. He retired accordingly, and accompanied by the landlord, ascended a creaky staircase, and entered a bedroom on the first floor, which appeared neat and comfortable enough. At this juncture, Simon suddenly recollected that he had forgotten to put his usual question, which he invariably made to the host or landlord of any inn or hotel at which he had not stayed before, as to whether there was a fire-engine in the place which could be made use of in case of emergency. He accordingly put the momentous question with much solemnity. The host replied in the affirmative.

'Then, my good man,' quoth Simon with still greater solemnity, 'one thing more, and I shall sink to sleep with a mind at rest. Is there enough water in the place to supply the fire-engine?' For Simon had known some cases in which, though there was a fire-engine, there had been no water, so that houses had been burnt to the ground for want of that important element. Again the host answered in the affirmative, and by way of a practical rejoinder, threw open the

little latticed window belonging to the apartment. A sound became immediately audible as of a rushing stream considerably swollen, emitting a hoarse and not unpleasing murmur. Simon was completely satisfied. He hastened to betake himself to rest; and while he dismissed the landlord with a benevolent 'good-night,' thought with a smile of self-complacency of his own sagacity and foresight in choosing to remain at the inn, instead of pursuing his journey in a cold and rainy night. He then sank into a delightfully profound slumber—the not unusual concomitant of a day spent in the open air—with an expression on his countenance of calm and placid self-content.

But alas! this well-earned slumber was doomed to meet with a speedy wakening. A wise Latin poet observes in one of his satires that no man can be for ever on the watch for danger, and is therefore often unable to confront it when it arrives. The truth of this aphorism he evinces by various apposite and highly poetical examples. But had he, with that powerful mental eye ascribed to the poet, been able to behold Mr Simon Lee as he lay slumbering in the inn, he would have found in him as convincing, though we confess less poetical, a proof of the veracity of his assertion. For a danger was impending which Simon in his wildest dreams could never have anticipated, and which, had his mind been able to foresee it, would have filled him with unspeakable dismay.

In the dead of night, when Mr Simon Lee's slumbers were of the deepest, there occurred a circumstance which, to Simon at least, was, or would have been at any other time, of a most ominous and startling nature. The door of the room in which he slept was suddenly assailed by a tremendous storm of blows and knocks. The person who was the occasion of these violent manifestations of physical energy, finding that they did not succeed in arousing the sleeping guest, endeavoured to open the door which intervened between him and the slumberer. In this too his efforts were balked, for the prudent Simon had, according to his wont, locked the door and piled up a barricade of chairs and other furniture against it. But the knocker recommenced his former exertions still more vigorously, accompanying them at the same time with several kicks, which spoke at least as well for the muscular power of his legs and the size and heaviness of his boots, as his former efforts had spoken for his arms and fists. As these sounds grew louder, Simon gradually grew conscious that an unusual proceeding was taking place, and sleepily raising his head, inquired huskily who the individual was who had thus aroused him, and what might be his intent by so doing. To this interrogation the knocker replied concisely and with a strong Irish brogue, in the following short but significant words: 'The flood be coomin'!'.

Now, the fact was that, in the upper part of the valley, a mass of water had been slowly but surely collecting for many weeks, augmented by every shower that fell, and reinforced by every rivulet that played down the mountain's side. Owing to an alluvial obstruction, this body of water had not been carried off, and thus had swelled to the size of a small lake, and on the particular night when Simon was sleeping at the inn, was just succeed-

ing in forcing its way through the barrier which obstructed its path, and about to precipitate its enormous bulk on the valley below. The village, as we have said, stood somewhat elevated from the centre of the valley, and was thus in great measure preserved from the approaching devastation. But the inn, from its exposed position in the very middle of the path which the flood would take, had, to all appearance, but little chance of escaping from the ruin and destruction which was about to ensue.

The reader will thus be able to appreciate the nature and extent of Mr Simon Lee's peril.

The landlord and his family having become aware of the impending calamity, had hastily aroused themselves from their beds, and were proceeding to cumber themselves with such articles as could be carried with them in their flight. Their second thought was for the weal of their English guest Mr Simon Lee. The waiter or attendant, who was the son of the landlord, and whose name was Daniel, was accordingly despatched to the chamber of the unconscious Simon, in order to arouse him from his slumbers. By what success his endeavours were attended, the reader shall see.

We left Simon Lee when he had just become aware of the fact that somebody had been knocking in a rather unusually vigorous manner at his door, and in reply to his question as to the name and purpose of the knocker, had received the startling announcement of the approach of the flood. Now, whether Simon's senses and intellectual powers were somewhat dazed by the torpor which, as we have said, was produced by his long drive the day before, or whether the waiter Daniel spoke in a more than usually strong Irish brogue—pronouncing as he did the word 'flood' much in the same way as 'food' or 'mood'—is certain that Mr Simon Lee completely mistook his meaning, and after a moment's reflection, came to the conclusion that 'the floode' must be the name of a *stage-coach*, which, as he knew, having been told so by the landlord, stopped at the inn on its way to W—— at about the hour at which he had been awakened.

'Stupid people!' thought Simon; 'as if I want to get up in the middle of the night to go by a stage-coach!' So the rudely awakened one raised himself slightly from his pillow, and in a sharp decided tone replied: 'I'm not going by it!'

Simple words, yet they appeared to startle the knocker very considerably. If any person possessed of the desirable gift of seeing on both sides of a door, could have put that faculty into exercise at the spot at which the scene we have described took place, the sight which would have been presented to his gaze might have somewhat amused him. On the one side of the door was Simon Lee, just settling himself in bed preparatory to sinking into a second sleep, with a complacent smile at having so quickly discovered the knocker's meaning, and at having so decisively replied to his noisy summons; his cotton night-cap, which had during his slumbers become disarranged, and was now perched waggishly over his left eye, making the picture complete. While on the other side of the door was a figure equally calculated to provoke the spectator's mirth. A huge uncouth countryman standing before the entrance to the apartment, and whose face, dimly

seen by the tallow candle which he held in his hand, presented the appearance of ludicrous astonishment and incredulity. There he stood, his clownish features growing more and more perplexed, with one hand uplifted, as though uncertain whether to recommence his former battery of the door-panel, or to take himself off altogether. But after remaining in this grotesque attitude for a minute or so, he decided upon giving the drowsy one a last chance.

Once more he brought down his huge fist on the quivering wood, and once more the unhappy Simon was awakened by the sound of the tremendous blow, and heard the repetition of the former alarm: 'Oi! oi! Get oop, yer honour! The floode be coomin'!'

Simon sprang up with an exclamation of anger. 'Stupid ass!' he muttered; 'didn't he hear me telling him I wasn't going by the coach? "Floode" indeed! What an idiotic name for a coach.—Go away, fellow!' he added, raising his voice. 'I tell you once more I don't want to be disturbed in this violent manner. As I've said before, I'm not going by it!' Nothing was heard after this except a rapid scuffle of retreating footsteps, and then a tremendous clatter of huge boots on the stairs, which seemed to betoken the final disappearance of the obnoxious Hibernian.

PRESERVATION OF ANCIENT RUINS AND MONUMENTS.

INCREASING interest is felt—not only by archæologists and historical students, but by the educated portion of the public generally—in the old structures and earthworks which are found in nearly every county in the British Islands. It is now admitted, with more and more emphasis every year, that such memorials of the distant past serve some of the purposes of authentic documents, in the absence of written and inscribed records. They throw light on the races, creeds, art, industry, and mental culture of ages long gone by. The peculiarity in the present condition of these old works and constructions is, that most of them are at the mercy of persons who care nothing about them. The railway engineer, the drainer of large estates, the constructor of roads and the builder of houses and streets, have made havoc with the old ruins in many instances, and seem well disposed to repeat the process—turning into ready-money a kind of property that scarcely seems to belong to any one.

There are amongst us some men commanding our respect by their poetical and contemplative temperaments, who regret the invasion of beautiful secluded spots by railway holiday people and tourist-ticket holders. They want the lovely lakes and lochs, the majestic mountains, the stern glens and ravines, to be left for the quiet enjoyment of the poet and the painter. But is there not a little selfishness in this? The beautiful world is made for others besides poets and painters. The hard-worked professional man, the manufacturer and the shopkeeper, the steady artisan, all can feel somewhat, at anyrate, of the pure pleasure associated with scenes of natural beauty; and it so happens that many of the ancient monuments and ruins which form our present subject are situated in the very localities which improved means of

communication are placing within reach of the public. What is everybody's business, however, is nobody's business; the public would like to see the old memorials preserved; but the public are a somewhat disorganised body, and cannot act effectually without a leader or leaders. Antiquarian and archæological societies have very properly taken up the matter; but as it is found that not much of a protective character can be insured without the aid of the legislature, members of parliament are endeavouring to render assistance.

At the time we are now writing, an Act of Parliament for the purpose has been framed, though it has not yet passed through all its stages; but it may be well to give a sketch of the last five years' proceedings.

In 1874 a Bill for the preservation of our ancient monuments was brought into the House of Commons by Sir John Lubbock, Mr Beresford Hope, Mr Russell Gurney, and Mr Osborne Morgan, gentlemen well entitled to speak in its favour. On the motion for the second reading, Sir John Lubbock drew attention to the fact that 'our ancient national monuments are rapidly disappearing, generally for very trifling reasons: not because they interfered with any important improvements or great engineering works. One notable reason is the following. The tumuli or funeral mounds, though each usually the burial-place of one chief, contained not only his remains but those also of the animals sacrificed in his honour, and sometimes those of his wives and slaves. *The earth of the tumuli thus became generally richer than the average, and is often carted away to be used as manure!*' Sir John proceeded to say that 'the great stone monuments are too frequently broken up to serve as gate-posts, or to mend the roads. Three dolmens [a *dolmen* is nearly the same as a *cromlech*, consisting of one large unhewn stone laid horizontally on the tops of two others placed vertically] near Marlborough were standing a few years ago; in 1872 one was left; one had been recently removed by a farmer because it interfered with his ploughing; and the third was being broken up to mend the roads. The Irish remains known as Con O'Neill's Castle, Castlereagh, were ordered by their proprietor to be inclosed within a wall built around the ruins.' If ever there was a real Hibernian bull, the agent of the estate perpetrated one on this occasion; for he actually pulled down the ruins themselves, to obtain stone for a wall to inclose them!

Abury or Avebury, renowned for the so-called Druidical remains that once belonged to it, has been sadly shorn of them in recent times. The old monoliths have in many instances been pulled down and sold merely for the few shillings they would bring. In 1872 the remains had a narrow escape. A Building Society purchased or leased much of the site, parcelled it out for cottages, and sold many small plots to members of the Society. By the exertions of three gentlemen residents, however, the allottees consented to exchange for other localities in an adjoining field, equally good for their purpose.

In Dorsetshire a stone circle at East Lulworth has entirely disappeared; as have four dolmens and two Roman Camps in other parts of the county.

It has been suggested by some of the Irish members of parliament that a protective shield, if

thrown around pre-Christian antiquities, should apply also to those of Christian origin. Unfortunately, Ireland is afflicted with this evil—that many of the ancient monuments in that country belong to absentee proprietors who live in England or Scotland, and who care very little what becomes of the old ruins.

An inquiry concerning Caesar's Camp, Wimbledon, curiously illustrates the difficulty of dealing with these matters. The owner of the land has memorialised the Parliamentary Committee in reference to his interest in the site. The Camp is, roughly speaking, a circular area of about nine acres. One half has been recently let on a building lease. The lessee is checked in his intended building operations through the want of a road to bring his materials; and he coolly asks permission to do this over the remaining half of the site. As to the Camp itself, it had originally an embankment and ditch around it; but the earth of the one has now pretty nearly filled up the other, and the whole area is nearly a dead level. Indeed many persons fail to see any indications whatever of an ancient camp.

Many influential members of parliament, although well disposed towards the preservation of these and similar ancient monuments, nevertheless object to the expenditure of public money for the purpose; they would rather see the work accomplished by means of private subscriptions. To this Sir John Lubbock replies that many valuable old monumental fragments are so prized by their present owners that they are sure to be preserved; that others could certainly be obtained by private subscriptions; but that the state might reasonably and judiciously aid in acquiring the remainder—with due precautions against inordinate prices. Let us bear in mind that countries much poorer than England manage to do this. Denmark has made arrangements for maintaining a large number of the old Scandinavian remains with which that country abounds, especially megalithic monuments. Holland has done the like, in regard to the relics of the low-German section of the Teutonic race. The late Emperor Napoleon III. directed much of his attention to the old Frankish, Gaulish, and Roman remains of France.

We have not deemed it necessary to dwell on the clauses of the Bills which have in past years been brought into parliament on this subject; but it may be opportune to glance at those in the Bill of 1879.

After declaring that 'it is expedient to make provision for the preservation of certain ancient national monuments,' the Bill provides for the appointment of a Board of Commissioners, to comprise the Inclosure Commissioners and the Trustees of the British Museum. This 'National Monuments Commission' is empowered to apply the Act to all the monuments named in a schedule annexed thereto; and also to any other which, in their opinion, is of sufficient national importance to be worthy of preservation, and which is *not situate in any park, garden, or pleasure-ground*. Previous notice in a prescribed form, is to be given to owners, occupiers, clerks of the peace, &c. that the Commissioners intend to take the charge of this or that ancient monument. Ample time is to be allowed between the issue and the fulfilment of the notice for the consideration of the subject by the parties interested.

Owners are carefully shielded from injustice in regard to any ancient monument which is entangled in the network of fee-simple, heirs of entail, life-interests, &c. The Commissioners may at any time acquire by agreement a freehold or other right in any ancient monument; and such rights of way as may be necessary for obtaining access for the public to such monument.

Next for the money question. No one can possibly say what is the intrinsic value of an old tumulus, cromlech, or round tower; and as it would never do to permit the owner to put a fancy price upon it, some other mode of estimate must be adopted. It is arranged, therefore, that the provisions of the Defence Act of 1860 shall apply, *mutatis mutandis*, throughout the United Kingdom, with certain modifications. Upon payment by the Commissioners of the purchase-money or compensation in regard to any ancient monument, such monument shall vest in them absolutely, as trustees for the nation. All the money is to be supplied by the Treasury, out of such grants as parliament may make for the purpose. The Commissioners are to send in a report of their proceedings every year to parliament.

Scotchmen and Irishmen of the humble class, to their credit be it said, are more alive to the ancient monuments of their native land than the analogous class in England. The driver of a Scotch four-horse coach, in the season when South Britons find their way to the north, has usually something to say, not only about the natural beauties of brae, ben, carse, glen, strath, and loch, but also about the old ruined or semi-ruined structures, and the stirring historical incidents with which they are associated. The driver of an Irish jaunting-car has in like manner his bit of animated talk about 'ould Ireland,' and if he is a little prejudiced at times, we can well afford to forgive him. The English Jehu, on the other hand, usually neither knows nor cares aught concerning the ancient remains that are to be encountered in his daily journey. Be this as it may, we should like to see a general concurrence in preserving the ancient historical ruins which are found in nearly all parts of the British Islands.

STUDIES FROM LIFE.

'CLUBNOSE.'

It was in a hospital at the East End of London that I first made the acquaintance of 'Clubnose.' An old college friend of mine, who was one of the resident surgeons, was shewing me over the wards, and there passed us two or three times a hospital nurse, whose remarkable appearance arrested my attention. She had, I think, the most hideous and repulsive face I ever saw on man or woman. It was not that the features were naturally ugly, for it was simply impossible to tell in what semblance Nature had originally moulded them; but they had been so completely battered out of shape, that one would have fancied she must have been subjected to much the same treatment as the figure-head on which Daniel Quilp used to vent his impotent fury. The hero of a score of unsuccessful prize-fights could not have shewn worse facial disfigurement than this tidily dressed, cleanly looking woman.

When we had finished our tour of the wards, I turned to my friend, and pointing to the receding figure of the nurse, who had just passed us again, I said: 'What a dreadfully ill-looking nurse you have there! Why, it must be enough to send a patient into fits to have that face bending over him.'

'Oh!' said he, laughing, 'that's "Clubnose."' Then lowering his voice, he added: 'She's not a nurse really—she's a detective.'

'A detective!' I exclaimed. 'Why, you don't mean to say that the police dog the steps of a poor wretch even in the hospital?'

'No,' he replied; 'I don't think she has her eye upon any of the patients—it is the friends who come to visit the patients that she watches. It is her way of doing business. Whenever there has been a crime committed in a neighbourhood, she goes out as a nurse to the hospital of the district. I don't exactly know what her *modus operandi* is. She has a proper certificate as a nurse, and performs her duties like any of the rest; but it is understood that every facility for getting the information she requires is to be put in her way, without of course exciting suspicion. How she picks up her information I don't know, but I suspect it is by listening to the talk of the patients and their friends, on visiting-days. At anyrate, I believe she has obtained clues under this disguise when others have failed her; and if the game wasn't worth the candle, I don't suppose she'd try it.'

'Do the other nurses know her real character?'

'No. They may have their suspicions; but it is kept a secret from all but the authorities.'

'Is "Clubnose" your nickname for her, or is she generally known by that *sobriquet*? I asked.

'No; I did not christen her so; it is the name she is known by in the force. Her real name is Margaret Saunders. She has a very queer history, I believe; but she is exceedingly reserved, and I have never had a chance of drawing her out.'

And this was all I learnt about 'Clubnose' on that occasion.

Three or four years later, two ladies with whom I was intimately connected were robbed of a considerable quantity of valuable jewellery, and I was intrusted with the investigation of the case. I had paid numberless visits to Scotland Yard, and had had no end of interviews with detectives, but still there was no satisfactory clue to the identity of the thieves. One evening I was sitting alone after dinner, when the servant entered and said that 'a person' wished to see me.

'Man or woman?' I asked.

'A woman sir—says she wishes to see you particularer sir.'

'Well, shew her in,' I said, inwardly wondering who the strange female might be who wanted to see me at so unseasonable an hour. The door opened, and a respectable-looking woman wearing a thick veil was shewn in. I requested her to take a seat. She did so; and as soon as the servant had retired and the door was closed, she threw back her veil and revealed the distorted features of 'Clubnose.'

I remembered her in an instant; indeed who that had once seen that face could ever forget it?

'You have come from Scotland Yard?' I said interrogatively.

'Yes sir,' she answered quietly. 'I am Margaret Saunders from the Detective Department.'

Her voice was harsh and unpleasant; but there was a firmness and decision about her manner, and a look of intelligence and resolution in her keen gray eyes, which at once inspired confidence. The bonnet she wore concealed to a certain extent the terrible disfigurement of her face; but even then the most reckless flatterer dared not have called her physiognomy prepossessing. It was not a bad face; but one could not look at it without a shudder, so frightfully was it mutilated. The nose in particular I noticed had been knocked into a grotesquely fantastic shape, thereby giving rise to the *sobriquet* by which she was familiarly known. She had come to inform me of a very important piece of evidence which she had discovered, and which, I may say at once, led ultimately to the identification and conviction of the thieves. Into the details of the case I need not enter; it was only remarkable because it introduced me personally to 'Clubnose,' and enabled me eventually to learn from her own lips the story of her life, which I purpose here briefly setting down.

Some five-and-twenty years ago, a crime was perpetrated in London which was marked by such exceptional features of atrocity as to send a thrill of horror through the whole community. A middle-aged gentleman of eccentric habits was attacked in his own house, and not only beaten and left for dead, but mutilated in a peculiarly shocking manner. The miscreants also carried off a considerable quantity of valuable property. The victim of this atrocious crime, strange to say, in spite of the horrible injuries he had sustained, was not killed outright, and though for weeks his life was despaired of, he eventually recovered, only, however, to be for the remainder of his days a helpless cripple. For some time the police could find no clue to the perpetrator of this barbarous outrage; but at last suspicion was attracted to a woman who was known to have been occasionally employed about the house to do odd jobs of cleaning. A person answering to her description, it was discovered, had been seen leaving the house in company with a man on the day on which the crime was committed. Some minor circumstances tended to confirm the suspicion that this woman was implicated in the affair, and she was accordingly arrested and charged before a magistrate. After one or two remands, for the purpose of obtaining further proof, the magistrate decided that there was not sufficient evidence to justify him in sending the case for trial, and the accused woman was discharged. That woman was Margaret Saunders. She had all along emphatically protested her innocence; and after her discharge, she vowed that she would never rest until she had proved it by bringing the real offenders to justice. The police, baffled by the failure of their charge against herself, were compelled to confess themselves completely at fault; from them, therefore, Margaret Saunders could expect no assistance. Alone and unaided, she set to work upon her self-imposed task. At the very outset, when it seemed to her that every moment was of value, she had the misfortune to fall down a flight of steps and break her leg. This necessitated her removal to the hospital, and it was as she lay there chafing at the enforced

delay and inaction, that there came to her the first ray of light to guide her on her search. In the next bed to her there was a woman who was also suffering from a severe accident. One visiting-day she heard this woman say in a low, anxious voice: 'Is Robert safe?'

'Yes' was the reply, also in a woman's voice. 'He's in Glasgow, ready to bolt if necessary; but there'll be no need for that—the bobbies have chucked up the game, as they mostly do when they've failed to fix a charge upon the first person they spot—unless there's an extra big reward offered, which there ain't in this case.'

How it was suddenly borne home to her that this 'Robert' was the man she wanted, 'Clubnose,' told me she never could quite make out. It flashed upon her all of a minute, she said; and she never had a doubt of the correctness of the instinct that prompted her to the conviction. She lay and listened, but could catch nothing more. She got a good look, however, at the woman who was a visitor, and felt certain she should know her again anywhere. Before leaving the hospital, Margaret Saunders had scraped up a speaking acquaintance with the patient who was so anxious about 'Robert,' and learnt enough to find out in what part of London she must look for information about the character and antecedents of the said 'Robert.' It was this incident, by the way, that suggested to her afterwards the value of assuming the disguise of a hospital nurse.

The ingenuity with which she ferreted out the facts which eventually determined her to track 'Robert' to Glasgow, was wonderful. And not less wonderful was her dogged patience. Even when she had run her quarry to earth and was convinced in her own mind that she had her hands upon the real criminal, she had to wait until she could piece the bits of evidence together, and above all until the victim of the outrage, whose brain had been seriously affected by the injuries he had received, had sufficiently recovered his mind and memory to give some intelligible account of the attack upon him. Even when he could do so, he professed himself exceedingly doubtful of being able to recognise or identify his assailants; he knew, however, that there were two of them, a man and woman. It was nearly eighteen months after the perpetration of the crime before the patience and perseverance of Margaret Saunders were rewarded with sufficient success to justify her in communicating with the police. The Scotland Yard officials were at first hardly inclined to credit her; but her earnestness convinced them at last that there was 'something in it.' Perhaps they were helped a little towards that conviction by the fact that she solemnly swore that she would never finger a penny of the reward. 'She had hunted this man down to clear her own character and set herself right with the world,' she said, 'and not a farthing of the reward would she touch.' It is unnecessary to dwell upon the sequel. Suffice it to say that 'Robert' was arrested, that his accomplice, who was the niece of the victim's housekeeper, was subsequently taken also; that the pair were tried, convicted, and sentenced, the woman to ten years, the man to penal servitude for life. Margaret Saunders was highly complimented by the judge upon the sagacity and acuteness she had displayed, his lordship observing that she was 'a born detective.' The press too was loud in her praises; and a subscription was set on foot as an

expression of the public admiration for the indomitable courage, resolution, and patience, and the extraordinary astuteness which had enabled her to bring two great criminals to justice.

The journal which had suggested and started the subscription deputed a member of its staff well known as a master of the 'picturesque' style, to interview Margaret Saunders and write up a sensational article upon her. He applied to the police for her address; and an inspector from Scotland Yard volunteered to go with him—Sir Richard Mayne, the then Chief Commissioner of police, having expressed a desire that something should be done for Margaret Saunders, to shew the official appreciation of her conduct. The journalist and the inspector accordingly proceeded together on their visit to the heroine. They found Margaret Saunders among very unsavoury society—in one of the lowest of the filthy dens that swarm about the London Docks. Not a very inviting subject for interviewing, and but a sorry heroine for a sensational article. However, they did interview her; and she soon, in language more vigorous than polite, gave them her mind upon the proposed recognition of her services. She wouldn't have anything to do with any subscription or reward—wouldn't touch a farthing.

'Look 'ere,' she said doggedly; 'what I done I done for my own sake, and nobody else's. I meant rightin' of myself, and I have righted myself. That's my business, not yours. I don't want nobody's money nor praise. Let 'em keep that to themselves.—But I'll tell ye what,' she added, turning sharply to the inspector; 'if ye mean true by all them fine compliments'—

'Most certainly we do,' interposed the inspector.

'Well then, I'll tell ye what ye can do to shew it.'

'What is that?' asked the inspector.

'Why, make me one o' yourselves. If I'm as good as you say, I might be worth something in your line. Make me one o' yourselves—a detective. That's all I ask; and if you won't do that, I don't want to have nothing more to say to ye.'

It was a novel and startling proposition, and the inspector was somewhat taken aback by it; however, he faithfully promised to lay the matter before the authorities at Scotland Yard, and let her know the result; with that, he and his companion left her. The end of it was that her wish was granted. Margaret Saunders was duly enrolled as a female detective, and a most active and intelligent officer she proved herself to be.

That is in substance the strange history of 'Clubnose's' connection with the police, as she herself told it to me. I questioned her also upon her professional career; but here she was more reticent; still, I gathered that it had been marked by many exciting adventures and hair-breadth escapes from death. I learned, for example, that she owed the horrible disfigurement of her face to the polite attentions of two water-side ruffians whose lady-companions she had been instrumental in consigning to the tender care of the jailer of Pentonville. 'They took it out o' me werry hot,' she said in her rough but undemonstrative manner. 'I reckon they thought they had done for me; but bless ye, I'm tough, and they got their seven years apiece for me—though mind ye, the Scotland

Yard folks would never let on as I was one o' them. They was tried and convicted for assaultin' of me as a ordinary person. The lawyers tried to make out as I was a police spy; but they couldn't prove it. But I had to keep clear o' that district for a long while arterwards.'
